The household of this kind of marriage with a non-heiress actually enjoys a considerable degree of independence from the descent groups of both wife and husband. If a man who has established a matrimonial life independent of his wife's natal *iing*, is not the authority of his natal *iing*, his relation with the latter usually becomes weaker. Economic and residential factors make it possible for the men to make the considerable shift from his *iing* to his wife's *iing*, and though 592 593 613

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

592 he clearly maintains the label of his descent group, he is at least
593 divorced from them economically. If a father's activities were such
613 as to permit the accumulation of wealth to be handed over to the next generation, he is always remembered with great respect and admiration by his successors and by the descendants of his wife's matrilineal line. In such a case he is looked upon as a member of his wife's descent group rather than of his mother's descent group. The best examples of this are the cases of men belonging to the first generation of Jatinga villagers, especially that of the founder of
[166] Jatinga. These immigrants to Jatinga mostly accompanied their wives, who were not heiresses (as I mentioned previously, the unit of Khasi immigrants is mostly found in this kind of a couple); and most of them established successful matrimonial life with paternal authority, having been freed from the gravity of both matri-kin of wife as well as of husband.

Not necessarily confined to such cases of immigrants, even in an ordinary situation, if husband is ready to devote himself for his wife and children, the matrimonial life mostly turns happier and well established one. For under the Khasi matrilineal system, a wife, if she is not the heiress, is normally oriented to develop surprisingly high degree of independence from her descent group, i.e. her natal *iing*, unlike women of other matrilineal societies. This fact is closely related with the unique structure of the *iing*, as already discussed.

As a woman (non-heiress) tends to keep a certain distance to her natal *iing*, her brother accordingly decreases his concern to her new household. The pressure of the authority (wife's maternal uncle or brother) of wife's natal *iing*, on such a household becomes less marked. The wife's brothers are members of her natal *iing*, not of her new established *iing*, and therefore none of them can act as an authority over her new *iing*, though they may exercise certain pressure on the sister's husband, since the sister who established the new *iing* still keeps her membership in her natal *iing*. In fact a husband actually feels pressure from his wife's brothers; the occasional visits of the authority of her natal *iing* exercise a psychological check on his whole control over her and his children. Should any serious mischance occur in the marriage, the wife will run to her brother for consultation. Furthermore, as member of her natal *iing*, he has the right to demand the property acquired by him if his wife has no successor, since it automatically belongs to his wife unless he acquired it without cohabitation with her, or through the capital of his *iing*. However, the process of segmentation in the *iing* leads the wife to greater attachment to her husband, particularly when his economic contribution is important, and as a consequence weakens her ties with her natal *iing*.

613 The limited rights of the brother over his sister's (non-heiress)

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

household are easily understandable in the light of the economic aspect of the fission of the *iing*. As I stated before, the non-heiress is given hardly any share of the property of her natal *iing* on her marriage (if the *iing* is rich a non-heiress and the sons may receive some part), and even if her new household happens to face serious economic difficulty, her natal *iing*, whose authority is vested in her brother, does not usually help her. This fact clearly suggests that brothers can have only limited rights over the elder sister's *iing*. 613

This is the crucial point of the Khasi matrilineal system. The *iing* is a very restricted descent group, giving opportunities to split off by those who have no right to inheritance. The *iing* has vertical continuity without expansion in collateral lines. Therefore, even the siblings of the same mother do not always form a completely constant unit of a functional descent group, since the elder sisters are oriented by their marriages to form a new *iing*, though they may retain their membership in their natal *iing*. The central core of the *iing* is the particular sibling bond between a sister (the heiress) and a brother (the authority), a pair of statuses. Other sisters are ready to leave and other brothers are fluid members, clearly differentiated in status from that particular brother (authority) and sister (heiress). This structural principle should be compared with other matrilineal descent groups, whose sibling group is based on interdependence between members of a group, not between particular persons or statuses. The structural unit of the Khasi social organization, is *not* the descent group based on sibling links, but the *iing*, though descent is the principal factor, and the limiting one, in the formation of the *iing* institution. The descent factor is delineated by the functional force of the inheritance rule through female ultimogeniture, which results in constant internal fission and segmentation in the descent group. Technically, it is very similar to the process of fission of the Garo *nok* on the unigeniture principle, though the internal structure is different. 182 611 613 [171]

The establishment of a new household by a Khasi woman with her husband, means the beginning of the establishment of a new *iing*, separated from her natal *iing* not only in residence but also sociologically. In other words, it is the process of fission and segmentation of an *iing*, matrilineal descent group. Therefore, a woman who has once established a new household independent of her natal household, will not go back to her natal house i.e. her mother's descent group, though her bond with her mother's descent group remains undiminished. Of course she may visit her natal *iing* occasionally, but in fact, much less than her husband will visit his natal *iing*. In this respect as well the Khasi manifest structural differences from the Ashanti as described by Fortes, where a mother goes back to her own matricentral household and often prefers to reside there (Fortes, 1949, p. 77). Even [171] 000

182 Even after divorce or husband's death, the Khasi woman stays on in her
586 household. Indeed many divorced or widowed poor wives, whose
613 children are still small, try their best to live and bring up their children
736 by themselves without asking their brothers' help. Of course a mother and her small children may go back to live in her natal *iing*. Such cases are found particularly when the woman's *iing* is rich. However, during my field work, I found no sense of psychological inferiority in Khasi women, widows or divorcées, such as we usually find in other societies. The personality of the individual seems to reflect the social structure.

182 Given such strong residential independence on the part of the
184 non-heiress, economically divorced from her descent group, and
586 oriented towards sociological separation from it, the husband's eco-
593 nomic and social contribution is handsomely rewarded by the estab-
613 lishment of a stable, happier, matrimonial life. In fact, as already mentioned, the divorce rate among such couples is very low contrasted with the high rate among marriages with heiresses. More accurately, I should say that divorce is more likely to occur among the latter owing to the conflict of loyalties towards spouse and *iing*. Therefore, when each partner has less loyalty towards his or her natal *iing*, the divorce cases become correspondingly fewer. Thus, among the Khasi, successful marriages are frequently found where there is branching off from an *iing*. And a new *iing* is always established by a husband's contribution.

182 Khasi men, who are well aware of this fact, prefer to marry a
184 non-heiress, since they will then form an independent household and
581 remain immune to pressure from their wife's kin. However, they say a poor or lazy man prefers marriage with an heiress. As Richards said of the matrilineal Central Bantus, the residence on marriage seems to be a most important index of the husband's status, though the determining factors of the residence of the Khasi differ from those of the Bantus (see p. 124).

182 In the case of marriage with an heiress, when the wife dies, the
184 husband usually returns to his *iing* (the youngest sister's house). But
587 in marriage with a non-heiress the husband often remains with his
593 children, if his children are not too small and he is not planning to
613 marry any woman other than his late wife's younger sister. If he marries his wife's younger sister, he has the right to stay on. This
736 kind of sororal marriage cannot take place in the case of a man married to an heiress, since a Khasi man is not allowed to marry the late wife's elder sister. This form of sororate is found among the Khasi, but the levirate is unknown, such as can be seen among the Ashanti
182 and the Ila, where a man takes his late brother's wife. Among
587 the Khasi, even if a widow happened to marry her late husband's

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

brother (actually not likely to happen), the levirate has no sociological implication in the social structure, which is specifically related to the residence rule. The levirate seems to have a significant function only when a marriage is virilocal—when the husband has full rights over his residence and property. This is also another aspect where the Khasi structure shows a marked difference from that of the Ashanti and the Ila, etc. 182 587

VI. Marriage of the Man of Authority of an *Iing*

Among these successful marital families, there are also shadows of a matrilineal order. These affect especially those men who are in the position of authority in an *iing*. Such a man, though he has an independent household with his wife and children, often visits his youngest sister's (or niece's) house, *iing (ka iing sew)*, and sometimes stays there. Such a man's attachment to his *iing* is not only social or psychological, but also often economic. The man, as authority of his natal *iing*, usually has economic control over the management, particularly so, if his *iing* has considerable property or active trading business. As husband/father in his family he works for his wife and children, but often takes into consideration as well the interests of his *iing*. I found such cases especially among richer villagers in Sheila and Jatinga, where the main economic activities were based on trading. 592 599 602 619 [182]

Among the Khasi, it is quite a traditional rule of the division of labour that women engage in trading activities at markets whether on a large or small scale. Husbands may carry goods from field to market, but male members are kept away from the actual scene of the selling and buying. However, these activities on the part of the women are controlled and accounted for by their uncle or brother, or even son (or, if no male member is available, by the husband), though in many cases they form separate domestic families. The man's control over the trade appears more marked when the scale of business is large. [443] [462]

A man of Jatinga, who worked in a shop in Haflong, spent his salary in keeping his wife and children, but at the same time he kept the accounts of his sister who was a professional merchant. Thus, the economy of the *iing* and that of the co-residential group are crossed by the dual rule of the man. Hence, among the Khasi, residential autonomy is not always an indication of economic autonomy. However, it should be clearly understood that a man's acquired property goes to his co-residential group, not to his *iing*. [421]

A man of authority is attached to his *iing* by the stronger ties of religious, social and economic (management) duties as well as by

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

592 sentiment, in spite of his forming an independent domestic unit. Such a
593 man with two households, the family of orientation and of procreation,
602 says "one leg is in my sister's house and the other is in my wife's,"
613 and he feels more at home in his sister's. In villages, whenever a
[123] Khasi man in such a position invited me, I was always taken to his sister's (or niece's) house, his *iing*, not to his wife's. There I was warmly welcomed with highest respect by the women of the household as the guest of their uncle (or of their brother), the head of the *iing*. Khasi men whom outsiders often regard as hopeless in their social position, thus enjoy the highest status in their *iing*.

One Khasi gentleman who occupies a fairly high post in the Government, at Haflong, leaving his wife (non-heiress) and children at Shillong, to my question "when you go to Shillong into which house do you first step," immediately replied, "As soon as I get back to Shillong, I take the way to my sister's home and there take the evening meal with them, enjoying their talk. Then I go to my wife's house where my loving children are waiting." This shows a typical Khasi man's psychology in relation to a family of orientation and of procreation. His first concern on coming back to his homeland is whether his sister and her children are well, since he is the man of authority in that *iing*. He feels much more relaxed in his sister's house where he is held in higher regard and more cared for.

I came across many similar cases. In Jatinga and Shella, such men on returning from their work, often have their evening meal with their sisters though their wives are waiting for them. Furthermore, if they choose to do so, they sleep at their sister's house without even going back to their wife's house. This results in an unstable married life, where a wife has to face a psychological handicap caused by the occasional absence of the husband, in spite of her advantageous position in a matrilineal and uxorilocal system. Many wives worry every day over whether or not their husbands will come to their house at night. And often this concern changes into sadness and loneliness when the husband does not return for several days on end. The wife knows her husband is at his sister's house in the same village. But she has no right to fetch her husband home. As in Western social dancing, the women have to wait till their partners come. During my field work I often came across these lonely women, just waiting for their husbands, each knowing he was only a few houses
[123] away. Though these Khasi women never show their feelings of loneliness in the presence of others, I, being a female anthropologist, was often told of the sadness of their married life. The situation of these women can be more easily understood if we remember the process of the segmentation of the *iing*, which separates each married woman from her descent group, her natal *iing*.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Thus, the marriage of a non-heiress and a man of authority also produces an unstable position for the husband in spite of his having an independent household. Therefore, the possibility of a really stable marriage is even more limited; it will occur only in the match of a non-heiress and a non-authority of the *iing*. But even these marriages cannot be free from the influence of a matrilineal social structure: the man of authority of the wife's *iing* may visit these couples now and then, curb the husband's power and remind both partners of the orientation towards the matri-kin, the *iing*, though this pressure is insignificant in comparison with that experienced by the heiress's family. Likewise, a husband now and then visits his youngest sister's house, *ka iing sen*. These constant matrilineal contacts offer husbands chances of escaping from even the slightest matrimonial tension. Whenever a Khasi man feels uneasiness, he will return to his sister's house rather than face a difficult situation with his wife. This tendency is maximised especially on the occasion of religious ceremonies, when all individuals are grouped around each *iing*.

It is apparent that the rules of the *iing* as the underlying structural pattern, function throughout the various categories of domestic unit of the Khasi community as the most important intrinsic force.

VII. Polygyny

After this long attempt at the structural analysis of marriages, I think one can theoretically predict what is the situation of polygyny among the Khasi. The theoretical framework elaborated through preceding discussions can also be tested by the empirical data in terms of polygyny.

Nowadays, the Khasi feel so strongly against polygyny that they have no knowledge even that they ever practised it. Many Khasi, in more sophisticated areas, did not believe my findings on polygyny in Sohkynduh and Kongton. I think this is due to the rapid Christianization of the Hills during the last hundred years. My interpreter, though he was not Christian, said to me in the village, "it is most regrettable to bring you to a village where we find polygyny." However, one of the ministers of the Cherra State to which the two villages belong, told me that there was no particular opposition to polygyny, though recent Christian influence gave people the idea that it was a shameful custom, and he mentioned the case of a polygynist in his area, a man who had recently died, who had had ten wives. In Jatinga whose inhabitants are all Christian, and in Shella where there has been much contact with, and influence by, Hindus, there were

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

178 no polygynists, though there were many personal temporary illicit relations or love affairs.

184 It is true that even in interior villages polygyny is rapidly decreas-
595 ing. In the two villages I found only two cases of polygyny: a man with two wives in Sohkynduh (Josio in List 6, whose wives are 26 and 32), and a man with three wives in Kongton (Jubongrai in List 9, whose wives are 8, 20 and 52). These cases appeared clearly as cases of polygyny which the villagers recognized as such, speaking of them quite differently from the way they would have spoken of lovers, calling them wives and husbands. Of course, the first wife socially outranks the secondary wives, as *ka tynga trai*, and the term *ka tynga tuh* is used for the latter, as Gurdon states (1914, p. 80). The difference being that the first wife has a legal marriage ceremony while the
585 others have not—*ka tynga tuh* means literally 'stolen wife.' About the marriage ceremony, Gurdon gives a detailed discription (*ibid.*,
595 pp. 127-130) and says there are three forms of marriage ceremonies, *Pynhiarsynjat*, *Lamdoh* and *Iadih-hiad*. The first and second forms are considered the more respectable; the last one is resorted to by the very poor who cannot afford the greater expense entailed by the first two. Unfortunately, during my stay in these villages, no marriage ceremony took place, but villagers described to me what seems to be the *Iadih-hiad*, where only a fowl is sacrified, and the whole procedure is much simpler than that described by Gurdon. However, whatever the complexity and richness may be, there is a distinct line between having a ceremony and not having it, and this draws the distinction between the status of the first wife and that of the secondary wives.

428 Nevertheless, this distinction has more of a social bearing than the legal bearing it has in a patrilineal system. Since they follow the
595 matrilineal system, the legal distinction between the first wife and
851 the secondary wife does not affect their children's status and their property rights, at least not in the villages where I worked. The children's social locus is determined by their mother. The children (particularly the youngest daughter) have the right to inherit their father's acquired property which is automatically under their mother's ownership. If the polygynist father has acquired property by working their mother's field, or in trading on behalf of their mother, whether she be the first wife or the second, this property undoubtedly belongs to the children of that wife, not to the first wife alone. The father's physical locus at the time of his economic realisations is the decisive factor.

591 The Khasi polygynist, without bringing his wives into one house-
595 hold, alternates his residence among them, in turn or according to his temper. This practice is similar to that of the Trukese described by Goodenough (1951, p. 123), and quite different from that of the Garo

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

which I described previously, where a man brings his secondary wives to his first wife's house in which he is acting as the head. Furthermore, sororal polygyny is prohibited, while it was prefered among the Garo in terms of wives taken from the same *mahari*, though mostly not real sisters. The strong jealousy, which I observed, among the Khasi wives of a polygynist, would appear to make such polygynous marriages with closely related women practically impossible. As shown in List 6 & 9 every single one of the wives of each polygynist belongs to different *kur*, and the two secondary wives of the man of Kongton came from neighbouring villages. 591 595 [171]

These aspects of Khasi polygyny are related fundamentally to the underlying Khasi social structure. It should be remembered that every married woman has her independent household, *iing*, and that two women of different descent groups never reside together (see p. 127). The picture is one of every married woman holding a key-point in the whole network of the social system, and men fit into this network with much flexibility. The strong stability of women and the fluid nature of men in terms of residence naturally produces this form of polygyny. This analogy is also true of lovers' relations and illegal marriages. Though polygyny is a rapidly decreasing institution all over the Khasi Hills, cases of lovers' relations and illegal marriages are found to be very numerous among the Khasi, as compared with neighbouring tribes and peoples in Assam. 182 591 595 613 837 [171]

Throughout my discussions of various forms of Khasi marriage, I found men to be more or less in the position wittily described by one of them as "having one leg in my sister's house, the other in my wife's," except in cases of the husband/father who succeds in establishing paternal authority, as in marriages with a non-heiress. Even in the latter a man might have a period of uncertainty until his children were born and until the economic basis for his matrimonial life was firmly established. For the rest, Khasi men would be in the position of either becoming the authority of an *iing*, or swinging between their sister and their wife, which may produce more opportunities for lovers' relations. One of a man's legs is certainly always found in his sister's house, the other may rest in his wife's, but it may also rest in another woman's house. The wife being rather accustomed to his occasional absence due to his visits to his sister's house, another kind of absence does not mark any great change from the usual situation, at least not physically. Such situations occur particularly in the earlier stage of the marriage, as a sort of continuation of premarital affairs, which are quite freely practised: it is a usual custom before marriage for young men to sleep at a girl's house whom they like though they say sexual intercourse usually does not take place in such cases. This I observed in Sohkynduh and Kongton. 182 591 593 613 836 837

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

182 595 Because of the firm right of women over the residence, Khasi polygyny can never be a clearly distinguishable institution, and has no operational advantage in the social and economic fields; the situation is very similar with lovers' relations and illegal marriages. By polygyny the man achieves no additional economic advantage, nor does he increase his social status or prestige; rather the reverse, for I observed that the polygynyst was regarded as a somewhat ludicrous or tragic figure. As for the woman, she is placed slightly at a disadvantage since the husband's economic activities are not concentrated on her household. However, even many legally-married wives are separated or divorced, so that such disadvantages are not only experienced by the wives of polygynists. The social disadvantage of being secondary wife is not serious, firstly, because wives, whether first or secondary, have social and economic independence—they do not belong to the husband as in the case of patrilineal systems. Secondly, the significance attached to the legal marriage institution is not so great, so that the handicap of being the secondary wife is not severe. What is most important, furthermore, is that her slightly inferior status does in no ways affect the next generation. Indeed such children, including [848] those of premarital or illegal relations, suffer no serious social disadvantage, though they are nominally distinguishable from legitimate [851] children. From this it is clear that the effectiveness of legitimate marriage, and paternal recognition are rather limited among the Khasi.

Thus, Khasi polygyny differs greatly from the polygyny of other societies in terms of its operation and of its form. It also differs in the incentive to its practice. Among the Garo and many other societies, the practice of polygyny usually depends on a man's economic capability, but among the Khasi, it appears rather to depend on his whim. 182 Khasi husbands are notorious for their heavy drinking and neglect of wife and children. 593 Some of them told me that their earnings, their children and everything they acquired go to their wife or sister, 733 leaving them with nothing; therefore they should at least have freedom to enjoy their life. This freedom seemed to mean women and drink. I am not sure how far this explanation is true, but it seems to justify their behaviour to a certain extent. I do not mean that this is the general characteristic of the Khasi husbands, but some such tendency is to be observed. Actually I often heard wives complain of their husbands' drinking and running after women, and was asked "Are your Japanese husbands also like that?", "What is the good of having a husband!" then comes divorce . . .

182 562 593 On the contrary, women placed at an advantage by residence and matrilineal inheritance, are required always to be on their best behaviour. There are very strict rules governing the behaviour of Khasi women. They are supposed not to drink, smoke, or play with

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

any man other than their husband. Women before marriage enjoy a considerable freedom in love affairs, but once married these are no longer tolerated. Women should be faithful wives. They should be so in order to keep their husbands who have a strong tendency to leave their wives. The husband of a woman who has an affair with another man, will never come back to her. There is no attraction to draw the husband, who has home at his sister's, to his wife's house unless she is good and charming. Such Gurdon's remarks as "There is no evidence to show that polyandry ever existed among the Khasis. Unlike the Tibetans, the Khasi women seem to have contented themselves always with one husband, at any rate with one at a time" (Gurdon, 1914, p. 77), is utterly nonsense: a Khasi woman is placed in a situation which is not easy to monopolize even one husband. Moreover, the Khasi social organization in general does not accord to the practice of polyandry.

DISCUSSION OF MATRILINEAL SYSTEMS

K
9
121

As a concluding discussion, I shall here deal with the main theoretical problems concerning matrilineal systems as a whole; at the same time, I shall attempt to make clear the structural alignment of the Garo and Khasi systems, together with other matrilineal systems. For this purpose, my analysis is focused particularly on the structure and composition of the descent group, with relation to residential patterns. For my argument it is very important to keep in mind the concept of the descent group. In this discussion, I use the term 'descent group' as constituting a 'corporate property group'; more properly, perhaps, this unit should be called the matrilineal inheritance group. Though the discussion deals mainly with matrilineal systems, it also touches upon theoretically important aspects of unilineal systems as a whole.[1]

1. The analysis of matrilineal descent groups has been greatly advanced since Audrey Richard's outstanding contribution on the comparative study of Central Bantu matrilineal societies (Richard, 1950). Among all, the recent publication of *Matrilineal Kinship* (Edited by Schneider and Gough, 1961) is a remarkable achievement as the landmark in the series of studies in this field.

My analysis presented here, however, has been developed quite independently from that of *Matrilineal Kinship* (when the latter was published, the manuscript of this essay had already been sent to the publisher: the publication of this book is unusually delayed). Though some of the issues touch upon the discussions presented by these authors, particularly of David Schneider's Introduction, the angle of my analysis differs considerably from theirs. Firstly, my analysis is primarily concerned with the differences in the structures of matrilineal systems, while Schneider's discussion intends to bring out the distinctive features of matrilineal descent groups in contrast to that of patrilineal systems; again it is also quite different from that of Kathleen Gough, the major concern of which is the corelations between productivity (or ecology) and social structure; and also from that of David Aberle's cross-cultural comparison by using a large ethnographic sample. Secondly, my argument develops from the analysis of the Garo and Khasi social structures, while in that of Schneider, these two matrilineal systems seem to fall in a rather exceptional cases: in fact they are excluded from a set of his collection of matrilineal systems, on which his theory is tested.

I

The discussion of Parts I and II reveals that the social structure of the Garo and the Khasi differ greatly. Similarity is found only at the level of the minimum criteria of matrilineal systems: the basic succession rules of mother-daughter, mother's brother-sister's son; and the fact that property is owned by the woman, but the controlling power and authority over it are in the hands of the man.

One of the most outstanding structural differences between the two lies in the composition of a property group: the property group of the Khasi is formed by a descent group at a shallow generation depth, while that of the Garo is maintained by the cooperation of two local lines, each of which represents a localized lineage group. Hence the descent group of the former tends to have stronger solidarity, whereas the latter tends to be weakened in its solidarity.

In a broad framework, in terms of social organization, the Garo fall structurally into a category based on the moiety arrangement, in which patrilineal systems, such as the Murngin, and the Kariera, etc., are also to be found. Theoretically, this type of mechanism is operative in either matrilineal or patrilineal systems: by the exchange of men in the former and the exchange of women in the latter.

On the other hand, the Khasi system presents more outstanding features of a type which is generally accepted as belonging to matrilineal systems. However, the basic structural traits of this system may also be found among patrilineal systems, in terms of relatively stronger descent group solidarity.

FIG. 12. — *Succession Lines of Female and Male in the Matrilineal System.*

Lines *A* and *B* may include sister-sister, and brother-brother relation respectively, also members of classificatory category; variations in these minor points depend on each matrilineal system.

Though both matrilineal and patrilinal systems may share such basic structural categories, they differ significantly in the following respects: in matrilineal systems, the ownership of the property and the authority over the property group never rest in one person, as in the case of the father/husband of the patrilineal systems, and the succession to these two offices follows the female line (mother-daughter) and the male line (mother's brother-sister's son) as shown in line *A* and line *B* in Fig. 12. This duality of office-holding individuals within the succession rule is the intrinsic cause

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

 G K

of complications and variations in matrilineal systems. The matrilineal system is not a mirror of the patrilineal system; it is a different system in which more complicated mechanisms are involved. This complexity of the matrilineal system is a decided handicap when it comes to resisting radical economic changes. In order to preserve the system, a fairly stable economy is required, well-balanced in its population and resources. This may be one of the reasons for the rapid disintegration or unstability of social organization of matrilineal peoples in the world. 121 171 182 611

The difficulty of preserving in function both lines *A* and *B* is caused by residential problems—individual marriages which contradict the sibling cohesion. According to my theoretical analysis, there are four alternative ways of resolving such contradictory factors, each case being represented by actual ethnographic samples.[1] Each arrangement represents a different degree of the function of the two lines *A* and *B* in relation to the residential pattern, as following (see Fig. 13): G K 171 182 591 611

FIG. 13. — *Central Core of Matrilineages in Relation to Property Groups and Residential Groups.*

The Garo type: The co-residential type is 'husband-wife' instead of 'brother-sister.' The function of both lines *A* and *B* is equally strong. This is kept by the marriage contract between two local lines, so that it is possible to keep the function of each line against the residential separation of the two lines in one descent group. This type is found at the moment only among the Garo.

1. For this discussion I take only such major matrilineal samples for which ample documentation is available. G K [121]

611

The Nayar type: The counter scheme of the Garo type: the co-residential type is 'brother-sister' instead of 'husband-wife.' The function of both line *A* and *B* is equally strong. This type is found among the traditional Nayar (except those in North Malabar) and the Minangkabau matrilineal people.

The Khasi type: The ideal co-residential type consists of a woman with either her husband or her brother. The function of line *A* is much stronger than that of line *B*. This type is found among the Khasi, the Hopi, the Zuni, the Trukese, the Negri-Sembilan Malay, the Yao, etc.

The Ashanti type: The ideal co-residential type consists of a man with either his wife or his sister. The function of line *B* is much stronger than that of line *A*. This type is found among the Ashanti, the Gwembe Tonga, the Mayombe, the Trobriands, the Nayar of North Malabar, etc.

In terms of the strong function of both lines *A* and *B*, both the Garo type and the Nayar type may fall into a similar category. But as already explained, their structure basically differs from one another, and clearly appears as the counter schemes of different residential arrangements. The Nayar type shares with the Khasi a rather similar structure in terms of a descent group equated with a property group, while in the Garo type the two lines *A* and *B* of a single descent group never form an independent property unit.

If, leaving aside the Garo type, we consider the three others, the Nayar type appears again different from the rest in so far as in it, both lines fulfill an equally strong function, while in the Khasi and Ashanti types, one of the two lines is always more developed functionnally than the other. The Nayar type presents the highest degree of descent group solidarity among the three. This Nayar situation might be compared with that of the traditional Chinese patrilineal systems.[1] In both social systems the structural importance of marriage is minimized: the role of a spouse is only to ensure descendants of the matrilineal (patrilineal) group. The structural importance of a husband (wife) is almost neglected, while the wife (husband) holds the paramount locus in her (his) descent line. The descent group manifests the strongest solidarity within itself, neglecting affinal relations with other groups. This principle results in the custom of the "visiting husband" in the matrilineal system; and, in the patrilineal system, in a total social shift of the wife by her complete assimilation into her husband's group, and separation from her descent group,—she has no social and personal independent locus in terms of the structure. It is an interesting fact that the most extreme scheme of highly institutionalized unilineal systems can be seen among societies of pre-industrialized high civilization. These schemes are structurally opposed to those of the system of the moiety

1. Fortes touches this point in his paper (Fortes, 1959, p. 208).

611

arrangement, such as the Garo and the Murngin, where both wife and husband keep important social positions as representatives of each descent group.

Leaving the Garo and the Nayar types, the following discussion deals with the implications of the differences between the Khasi type and the Ashanti type. The degree of function of the two lines *A* and *B*, is related to the residential arrangement. A household of the Khasi type includes the matrilineage women and either their husbands or brothers—brother's wives are excluded as a rule. A household of the Ashanti type includes the matrilineage men and either their wives or sisters—sister's husbands are excluded as a rule. Among the Khasi as I have already explained (p. 127), a woman and her brother's wife are never found as members of a common household, while among the Ashanti, as Fortes states, a man and his wife's brother are never found as members of a common household. In the former, since a woman is the centre of the matrilineage, her husband stands socially closer to her matrilineage than she does to his—the husband shares the matrilineage dwelling, while a man being a peripheral member, his wife is excluded as a rule from his matrilineage residence (hence predominantly uxorilocal);[1] the Ashanti type examplifies exactly the opposite case (predominantly virilocal or avunculocal).

The crucial point in which lies the difference between the Khasi and Ashanti types is the rule of inheritance. In matrilineal systems, as a rule, the ancestral property is inherited by the matrilineal descent group. The starting point of the difference is really in the ways of inheritance of the *acquired property* particularly by the husband. So long as a man remains with his matrilineage members, both types show no difference. The crucial difference appears in the married life. In the Khasi type, if a man builds an independent house in which to live with his wife and children, that house and his acquired property during his matrimonial life automatically belong to and are inherited by his wife and children. On the other hand, in the Ashanti type, if a man builds an independent house in which to live with his wife and children, that house and his acquired property belong as a rule to him and are inherited by his matrilineal group, not by his wife and children. In case of divorce or death of a spouse, the difference between the Khasi and the Ashanti types appears most clearly: in the former, it is the husband who leaves, and in the latter it is the wife and children who leave. Hence the residence pattern reflects

1. Among the Yao-Cewa group, which I classify into the Khasi type, a senior brother who is selected for the position of head of a sororal family, takes his wife with him. This virilocal marriage should be considered as an exceptional case applied to only such a particular member. Such special arrangement is also found among the Nayar where duolocal arrangement is general rule.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

K
G
171
182
611

these rules, as the Khasi type tends to a uxorilocal arrangement, whil the Ashanti type tends to a virilocal or avunculocal arrangement

In the Khasi type, the residential arrangement is the decisive facto for a man's economic achievement. The men, though they keep clos social and ritual ties with their matrilineage, are divorced economicall from their matrilineal descent group.[2] On the other hand, in th Ashanti type, where the matrilineal rule is the decisive factor, me keep strong social, ritual and economic ties with their descent grou at the expense of the women's and children's residential mobilit However, these women are not like men of the Khasi type; as amon the Ashanti, women mostly go back to their matrilineage at a la stage of their married life. In the case of the Trobriands, the wi stays all her married life at her husband's house while her sons g back to her matrilineage, and her daughters leave for their husband house at their marriage. This can be considered as the exact opposi of what happens in the Khasi type. The matrilineage represente by men keeps its function and solidarity at the expense of the wome There, the female line (mother-daughter) is broken, in practice, b the residential arrangement, as was broken the male line (mother brother-sister's son) in the Khasi type. The actual tie of the Tr briand wife to her matrilineage is maintained through the presen her brothers send her, not through mother, sister or daughter. Th of the Khasi husband is maintained through his youngest sister niece, not through his brother or nephew. Thus Trobriand wiv and Khasi husbands are marginal members of the matrilineage. The facts show that they sacrifice either the male (*B*) or the female (line to the co-habitation of wife and husband. Unless they have structural arrangement like that of the Garo, the co-residence of t married couple is the crucial factor which modifies the matrilin system.

The Ashanti manifest great unstability in this respect, since th do not like to sacrifice either line *A* or *B*, though actually line *A* much weaker than *B*. The mother wishes to be with her daught and son, while the mother's brother wishes to be with his siste son, yet they do wish to have co-habitation in their marriage—co bining theoretically opposed factors. This is also the case whi I found among the Nayar in the transitional stage of the disinteg

1. These arguments do not mean that all members of a society act in same way; in any society, considerable variations in residential pattern found in individual cases. What is important here is the model, and the ori tation of ideas of the people, the pattern of which is usually followed by majority of the people in a given society, at a given time.

2. Among the Khasi, though the authority of the *iing* may keep the acco and manage his sister's property, his acquired property through his wife's f or his independent economic activity definitely go to his wife and children.

Garo AR5

 K G 171 182 611

tion of the matrilineal system (see Nakane, 1958/B and 1962). In comparison with the Ashanti, the Khasi or the Trobriand type gain considerable stability by sacrificing either *A* or *B* line, which is one of the possible ways of preserving the matrilineal system along with the practice of co-habitation of the married couple.

Another solution of the conflicting situation in such a society is the practice of cross-cousin marriage, as in the case of the Ashanti, which brings two conflicting factors together, the matrilineage and the family of procreation. In this case, the cross-cousin marriage tends to take place between the first cross-cousins centred around each man. Fortes states, "Cross-cousin marriage most often occurs between the children of full siblings or of uterine first cousins . . . cross-cousin marriage offers a possibility of reconciling the conflicting influences of conjugal, parental, and matrilineal kinship ties" (1950, p. 282). This is quite different from the cross-cousin marriage of the Garo, because among the latter, the cross-cousin marriage being practised as the basis of the whole structure of society, it makes no difference whether a cross-cousin is first or classificatory. In the case of the Ashanti and other matrilineal systems of a similar type, such as the Mayombe and the Kongo, it is considered most desirable to enter into a first cross-cousin marriage; classificatory cross-cousin marriage, such as among the Garo, does not make much sense. Moreover, the cases of cross-cousin marriage tend to take place among comparatively wealthy members in a society (see Rattray, 1927, Chapter XXIX). If one has no property in the Ashanti type society, then cross-cousin marriage has not much meaning. G [582]

The cross-cousin marriage of matrilineal systems has been often referred to as being the solution to the conflicting situations of a man as a husband and as a brother. I suggest here that this can be applied to the matrilineal system of the Ashanti type; not to those of the Khasi type where men have already given up the role of forming the central core of the matrilineage. In these societies, the solution is already given through the sacrifice of one line. There are no conflicting economic factors, though men are still in a situation of social conflict between their matrilineage and family of procreation. This hypothesis is confirmed empirically by the fact that there are no prescribed or preferential cross-cousin marriages among the Khasi, the Hopi, the Zuni, the Trukese and the Negri Sembilan Malay,[1] where a man is not in economic conflict with his matrilineage and family of procreation. His nephews are already outside his economic K [582]

1. "In arranging marriages the preference is for someone 'near'. As cross-cousins are the nearest possible naturally a large number of these marriages occur . . . This preference, however, is not explicitly institutionalised . . ." (Swift, 1958, p. 156).

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

K 9 171 182 611

scope; due to uxorilocal marriage, they have no right over his residence and his acquired property. Naturally the maternal uncle becomes far less important than in the Ashanti type.

Among the Yao, which I classified as belonging to the Khasi type, Mitchell states that in spite of the emphasis laid on cross-cousin marriage by his informants, real or classificatory cross-cousins are found in only 15 per cent of 103 first marriages (Mitchell, 1956, p. 200). The functional importance of cross-cousin marriage among the Yao is particularly evident in the minority (headmen of villages or lineages) who practise virilocal marriage[1] in a society where a uxorilocal arrangement is the general rule; as in the case of the Ashanti, cross-cousin marriage functions as a solution to two conflicting tendencies: matrilineality and virilocality. The Trobriands, though they belong to the Ashanti type, demonstrate the same structural analogy to the Khasi type, though in reverse. Among Trobriand commoners there is no preference for cross-cousin marriage. The much discussed cross-cousin marriage of the Trobriand aristocrats should be considered as the exception, as has already been examined by Leach (1958, p. 139). In this regard the Yao and the Trobriands produce a picture somewhat similar to the Ashanti type, among the minority of society, though the general practice bears similar features with that of the Khasi type.

It has become clear that cross-cousin marriage is closely related to the type of residence, i.e. virilocality, combined with economic factors. Furthermore, the cross-cousin marriage signifies the political importance of the maternal uncle as lineage head. Thus the Khasi type and the Ashanti type represent alternative arrangements to the different locus of the core of the functional body, the matrilineal descent group.

II

K 9 171 182 613

The preceding section has made clear different types of matrilineal systems as far as the *internal* structure of the descent group is concerned. This section deals with the relation of the descent group to the *external* organization.

Both the Garo and the Khasi follow a unilineal system, but they do not have what is called "segmentary lineage" organization, which has been much discussed in the African field. As generally understood,

1. Richards states: among the Yao-Cewa group, a cross-cousin marriage is likely to be found between a daughter of a head (male) of a descent group and his sister's son (Richards, 1950, p. 235). Mitchell states that Yao cross-cousin marriage is one of the solutions for the conflict between the principle of uxorilocal marriage and the principle of male leadership of the lineage (Mitchell, 1956, p. 144).

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

lineage is a corporate unilineal descent group of which the members can establish demonstrable genealogical relationships to each other. According to Firth, "lineage is essentially a unilineal descent group with some corporate functions, normally related by segmentary process to other descent groups of the same type, and with them usually covering the entire society" (1957, p. 4). The Garo and the Khasi can then be said to have the lineage, but to lack its segmentary organization which *normally* is found in a unilineal society. Both social structures exemplify the importance of the residence as a functional unit, against the wider descent group which may be called the lineage group.

In the case of the Garo, the localized lineage is expressed in terms of the village (or group of villages) whose land bears the name of the localized lineage. However, it is the village which acts as the functional corporate body, the economic and ritual unit, not the group of members of the localized lineage. The village theoretically consists of the members of the two localized lineages, as represented in the headman and his wife respectively. Practically, though it bears the name of a particular lineage to which the wife of the headman belongs, as also usually the majority of the inhabitants, it includes many other lineage members as well as the traditional two lineages. Therefore, the lineage is not, in this sense, an exclusive corporate unit with a ritual and economic function, though it gives a theoretical framework to the structure.

In the case of the Khasi, the lineage is found only on a household scale, centred in the woman, the property owner with members having direct matrilineal kinship ties to the former, such as her brothers, elder sisters, sons and daughters, who may or may not reside in the same household—the members of the *iing*. Beyond this unit (the *iing*) one can hardly find any functional organization based on the descent system. In other words, the lineage becomes a functional unit only at the level of the household, e.g., the lowest level of segmentation of the descent group, and it lacks wider external organization by the same principle. The clan is considered rather as a ritual conception implying exogamy, not as an organized body of kin.

These phenomena contrast sharply with the Hopi and the Ashanti social organization, where lineage organization has crucial importance wider than on a household level. Many factors can be considered in this connection. First of all, the locus of property and ceremonial unit are the most distinctive features. Among the Khasi, property and ceremonial units are always found in an *iing*, represented by the youngest daughter's household, while that of the Hopi and the Ashanti are in a wider lineage organization in which members of many households are usually included. The Zuni pattern seems also similar to that of the Khasi. The difference between the Khasi and Zuni lies

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

K
9
171
182
592
613

in the rule of inheritance; the former follows unigeniture (ultimogeniture), while the latter does not. Therefore, the number of members of a Zuni household is naturally larger than that of the Khasi.[1] Against the average number of a Khasi household, four to five, that of the Zuni is seven and a half to eight persons (Kroeber, 1917, p. 124). Among the Khasi, sisters separate through marriage in every generation, leaving the youngest in their natal house; while Zuni sisters may stay together even after their marriages. Kroeber states:

> "The house belongs to the women born of the family. They come into the world, pass their lives, and within the walls they die . . . Now and then a new dwelling may be built by all the inmates, or for a girl of the house by an enterprising husband; but in general the same walls, or reerected ones on the same spot (*ibid.*, pp. 47-48). . . . It is true that a Zuni 'house' often contains what we should regard as two or three households, but as long as it includes only one used hearth, and all natives insist that the two or three households are a single one" (*ibid.*, p. 124).

The internal composition of the household may differ from that of the Khasi, but the household in terms of the important institutionalized unit, is very similar to the Khasi. Li An-che states that "characteristics of a joint household based on the kinship principle stand out very strikingly" (Li, 1937, p. 75). Eggan's statement brings Zuni social organization much closer to the issue. He writes, "In terms of Kroeber's table it would seem that the Zuni tend to equate a lineage with a household, except in cases of recent expansion or budding off" (Eggan, 1950, p. 189). He gives a further illuminating analysis of this point:

> "We have noted that the lineage principle, . . . also provides a mechanism for the inheritance of ceremonial duties and obligations and the transmission and preservation of fetishes and other ceremonial paraphernalia. In Zuni this inheritance is phrased in terms of the household, but it is clear that it is the lineage segment born into the household that is important. This lineage segment, or at least the female line thereof, also owns land and holds it in trust for succeeding generations, to be worked by the men who marry into the household" (*ibid.*, p. 217).

Another similar equation of lineage and household, comparable to that of the Khasi and the Zuni, is found among the Trukese. According to Goodenough (1951):

1. This involves not only the difference of the number of members to a household but also the relation between the members of a descent group. As already discussed, the core of the descent group among the Khasi, is the pair of statuses: the owner of the property (the youngest sister) and the authority (a brother), not the sibling group altogether (see p. 131) as happens in other matrilineal systems appearing in this discussion. In regard to the unigeniture succession itself, the Garo share the same system as the Khasi, though it appears to operate differently by reason of the structural difference of organization.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

K
9
171
182
592
613

"In aboriginal times they used to be associated with most lineages a dwelling house, *jimw* (p. 67) . . . *jimw* is the corporate property of the lineage or descent line whose women live in it, but it is normally built by their husbands" (p. 68).

Here, it is clear that a household provides the major locus of a lineage. In other words, a lineage is a corporate property group with a common residence. This is also the case of the Nayar *tarwad* and the Minangkabau *parui*, though in these cases the household excludes the spouses of its members, while with the Khasi, the Zuni, and the Trukese the spouses (in most cases, the husbands) share the residence.

Though they may differ in scale and size from one society to another, as well as from one household to another, the functional lineage founded upon residence has thus a similar range in all of these systems. For convenience sake, I tentatively term this type of lineage "household-lineage,"[1] as opposed to that of the Hopi and the Ashanti, which might be termed "segmentary-lineage."

The average number of Khasi and Garo household members is four to five, that of the Zuni seven and a half to eight as stated above, the Trukese is eighteen (three to thirty-four in Romonum Island, according to Goodenough), while the Nayar range from thirty to two hundred. These differences, I think, mostly depend on the economic (and environmental) situation; they should not be regarded as structural, except for the Garo and the Khasi, which, because of the unigeniture rule, have smaller and fairly uniform households. The wide range of variation in composition which we observe among the Trukese and the Nayar is due in reality to economic and environmental factors: the more favorable the circumstances, the larger the unit.

The co-residential group and the property unit do not always necessarily correspond. One property group may consist of more than two independent residences. But even in such cases, the lineage is likely to be found in a group which formed a co-residential unit in the recent past, and which should be considered as marginal cases, derived from the recent fission of a group—it is a lineage in process of fission not a constant kin-group based on wider organization such as we find among the Ashanti and the Hopi. Usually such a lineage ceases to function shortly after it loses its common property, which usually follows closely upon the fission of the residential unit. Thus, in the course of time a once-recognized lineage group disappears into the common sea of the clan, which represents only a ritual and exogamous unit. In some cases, even this clan loses its function, as happens among the Nayar and the Minangkabau, where the lineage which

1. It should be noted that it does not mean that the lineage consists of household members, but that the lineage solidarity is found around the range of a household scale.

592
613
000

corresponds (or corresponded in the near past) to the co-residential property-group itself becomes an exogamic unit, disregarding the wider unit of the clan. Structurally it can be said that in these societies a lineage cannot exercise its full function unless it has a common residence based on a property unit.

In contrast to these societies, I cannot help but think that the Ashanti and the Hopi belong to a different type. Both Fortes and Eggan lay great emphasis on the descent principle, based on the ethnographic data of the Ashanti and of the Hopi respectively. The best examples of statements concerning this issue are the accounts in which both stress their disagreement with Kroeber's argument of 1938 in favour of the priority of local residence relationships over those of descent, under the title of "Basic and secondary patterns of social structure."

Fortes states:

"A lineage cannot easily act as a corporate group if its members can never get together for the conduct of their affairs. It is not surprising therefore to find that the lineage in African societies is generally locally anchored; but it is not necessarily territorially compact or exclusive. A compact nucleus may be enough to act as the local center for a group that is widely dispersed. I think it would be agreed that lineage and locality are independently variable and how they interact depends on other factors in the social structure. As I interpret the evidence, local ties are of secondary significance, *pace* Kroeber, for local ties do not appear to give rise to structural bonds in and of themselves. There must be common political or kinship or economic or ritual interests for structural bonds to emerge. Again spatial dispersion does not immediately put an end to lineage ties or to the ramifying kin ties found in cognatic systems like that of the Lozi. For legal status, property, office and cult act centripetally to hold dispersed lineages together and scattered kindred" (Fortes, 1953, p. 36).

Eggan states:

"For the Hopi the kinship structure is centered primarily around the lineage; the household relationships are secondary (Eggan, 1950, p. 113).

"Furthermore, it is the lineage and clan, rather than the household group, which is intrusted with lands and ceremonies and which is considered to own the house itself. Important as are the ties of residence and subsistence associations, they are not the key groupings in Hopi estimation—or in terms of our interpretation.

"Kroeber explicitly leaves kinship out of account in his analysis of 'basic and secondary patterns of social structure,' but in a sense kinship is more fundamental than either patterns of residence or formal grouping. Our analysis of Hopi kinship has suggested that both the household and the lineage organizations are encompassed in the kinship system. And it is clear that 'the kinship system is organized in terms of the lineage principle rather than in terms of residence" (*ibid.*, p. 133).

These arguments seem to me to refer more to a difference of social organization than to a theoretical contrast. On the basis of my own

13. Nakane E-5 (1955 1956) 1967 AR7 Khasi AR7
Garo AR5

field work as well as on the accounts of various matrilineal systems, 000
I feel strongly that there must be different types of systems which may be distinguished as "household-lineage" and "segmentary-lineage". Fortes and Eggan postulate the pre-eminence of the descent principle over residence. Though this may be the case among the Ashanti and the Hopi, it does not fit the cases belonging to what I call "household-lineage" type. Firth's argument emphasizing the importance of rights to group membership being associated with locality, fits very well with the latter case. With more precision and subtilty than Kroeber, he argues that "residence by itself does not give title to descent-group membership, but land rights established by descent-group membership tend to remain operational only through residence" (Firth 1957, p. 7).

I believe there are crucial differences between these household-lineage type and segmentary-lineage type organizations. The technical process of fission into segments is similar in both types. But in the former, once a segmented group attains autonomy, the relation between the segments will easily be forgotten after a few generations, as it has no significant social implication. Among these societies, people's genealogical memory outside the residential group is surprisingly poor. This empirical fact also suggests a different structure from that of the segmentary system.

In both types of society the internal organization of a household is the same, but it differs externally. Eggan states that "Kroeber's and Parsons' statements about the lack of system in regard to Zuni kinship indicate judgement from some arbitrary standard" and adds "The concept of the lineage provides a bridge between the household and the clan" (Eggan, *ibid.*, p. 197). I cannot agree with this. In K
fact, my study of the Garo, the Khasi and the Nayar corresponds 9
very well to the Zuni situation described by Kroeber and Parsons. 171
There are matrilineal systems which lack a bridge between the house- 182
hold and the clan.

Then what is it that makes the difference between the two types 592
of organization in similar unilineal systems? I am not sure that I can 613
produce at present effective hypotheses on this issue. However, empirical facts show that the household-lineage type organization is likely to be found among more complicated societies or in a society with considerable mobility. This we gather also if we compare the village compositions of the Hopi and the Zuni. In the case of the Khasi, K
we saw that there was considerable mobility in population even in [166]
remote villages, so that we easily understand that in such a condition lineage membership hardly maintained itself. This seems to agree with the view put forth by Fortes on segmentary systems. Fortes 000
says the limits of the spread or span of internal segmentation of the

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

000 lineage "are set by the condition of stability in the social structure which it is one of the chief functions of lineage systems to maintain" (1953, p. 32). The Nayar and Minangkabau are highly institutionalized cases with a rich economy and a high agricultural civilization, and among matrilineal peoples they undoubtedly appear as most integrated and complex. Then it may be suggested that the household-lineage type organization appears in less stable or more complexed societies than in that of segmentary systems.

With reference to this issue, the analysis of kinship terminology seems to throw a certain amount of light. Eggan, comparing the Zuni kinship terminology to that of the Hopi, concludes "there is a marked structural resemblance to the Crow type in general and the Hopi system in particular" (1950, p. 182). Resemblance between the Zuni and the Hopi terminology is found particularly in Ego's generation: father's sister's son is 'father', father's sister's daughter is 'father's sister'; and mother's brother's son and daughter are designated by the term 'child'—a terminology usually accepted as characteristic of the Crow type. However, Zuni terminology differs from that of the Hopi (the Crow type) in the following two points: first, the above mentioned cross-cousins termed 'father,' 'father's sister' and 'child' are also called by sibling terms (according to Kroeber, 1917, pp. 75-81). Schneider and Roberts state, "informants reported that sibling terms were most commonly applied to mother's brother's son, mother's brother's daughter and father's sister's son; that father's sister's daughter was called *ãnãn* (father's sister) as often as *ãawo* (elder sister)" (1956, p. 11). Secondly, the lineal distinction manifested in the terms for cross-cousins has no structural continuity, as in the case of the Hopi; it disappears by the child's generation: against Eggan's prediction on the Zuni terms as belonging to the Crow type, Schneider and Roberts found that father's sister's son's child had no term (Eggan: brother and sister), father's sister's daughter's son was 'grand father,' 'elder brother' (Eggan: father), and descendants of persons belonging in the above categories had no term.[1]

Taking these facts into account, I suggest that Zuni kinship terminology has a framework of the generation type with some inclination towards the Crow type, since the lineal distinction of collateral lines can be seen only in limited generations, in contrast to that of the Hopi where differentiation continues from generation to generation. Furthermore, this distinction is not as sharply made as in the Crow type, because cross-cousins are also, and more often, termed 'sibling.'

1. They conclude that "It is neither pure lineage in type nor pure generation but best be described as 'modified' Crow," in other words "Zuni terminology is modified lineage, rather than 'pure lineage' in type" (Schneider & Roberts, *ibid.*, p. 11).

15: Nahone E-9 (1955-1956) 1967 AR7 Khasi AR7

000

This Zuni type kinship terminology is also found among the Truk: its basic framework is generation type, and cross-cousins have additional terms which suggest the principle of the Crow type (one's father's sister's children classed as parents and one's mother's brother's children as children).[5] Such duality of terms for cross-cousins in a framework of the generation type was also the case of the Khasi, as I described in pp. 117-118. On the co-existence of alternative terms and irregular usages and certain lineage principle in Zuni kinship terminology, Schneider and Roberts note that its weak corporate character is reflected in the failure of the Zuni terminology either to segregate or lump members of contiguous lineages, and in the subordinate position of the ordering or classifying function of kinship terms. And they distinguish the Zuni case, as weakly corporate groups, from societies like the Hopi, as strongly corporate groups.

I consider that the crucial structural importance of the differences between the Hopi type and the Zuni type lies in the method of recruiting kin into a social unit. The Zuni type is used within a comparatively small unit, like a household, because the members of kin-groups which are included within second generations from Ego correspond to the limit of a domestic unit, while the Hopi type is used to recruit kin in a much wider way, since lineal differentiation extends from generation to generation, with a clear demarcation of the whole population of a society as a result. This reminds me of Eggan's statement on Hopi kinship terminology. He writes: "From the standpoint of kinship structure these 'vertical' groupings of kindred represent collective or generalized relationships with definite positions and obligations. For the Hopi the kinship structure is centered primarily around the lineage; the household relationships are secondary" (Eggan, *ibid.*, p. 113). My hypothesis can be supported by the empirical fact that the kinship terminology of all matrilineal systems discussed as the household-lineage type exemplify the same structure as the Zuni type, that is, basically generation type with some tendency to the Crow or Iroquois type: lineal differentiation doubled with sibling term is restricted to the second generation from Ego.

However, this argument does not tend to prove that restricted kinship type corresponds to household-lineage structure, and vertical type to segmentary-lineage structure, but only that certain correlations can be observed. The Ashanti present a critical case for these arguments. The function of Ashanti lineages as described by Forde

5. See Goodenough, 1951, pp. 95-96. Goodenough explains this dual usage of Truk kinship terminology in terms of Ego's relation to his own matrilineage and his father's lineage, as Ego is a potential heir of both lineages: the terms of the generation type are used for the former relation and the terms modified from the Crow type are for the latter relation.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

has a striking resemblance to that of the Hopi as described by Eggan. The lineage, having segmentary structure, performs strong functions as a land ownership and religious unit. However, from Rattray's account, we understand that all grandchildren of matrilineage as well as children through the male line, are called *nana*, a term which is also applied to grandparent's generation. This means that the lineal classification does not extend beyond the second generation from Ego; such a classification corresponds to the Zuni-type, but not to the Hopi type.

Coming back to the discussion of the correlation between the restricted type of kinship terminology and household-lineage, we should consider another important aspect of its bilateral character. In these societies can be observed considerable bilateral tendencies reaching beyond the household-lineage. As I have made clear in the description of the Khasi, the social and economic relationship with outside members of the household are no different towards people who belong to the same descent or clan than towards those who belong to an entirely different kin-group, except as concerns directly related kindred, such as sibling and mother and children. The matrilineal group wider than the *iing* has no exclusive function at all except avoidance of marriage. In this level of arganization, there is no extention of the organizing principle of the matrilineal descent system. For instance, households A, B and C are matrilineally related to each other (A is the original and B and C the outcome of the fission of A). Such matrilineal links have no exclusive features that mark them off from other households unrelated through the matrilineal descent line; actual matrilineal links are minimized in their value and function in regard to relations between households. Such characteristics of this kind of organization must be corelated with the existence of an inheritance case, in which the matrilineal rule is distorted as I mentioned elsewhere (p. 121): if there is no daughter to succeed the *iing*, the son can inherit the acquired property of the *iing*, thus creating by transmission of the property, an entirely new *iing* (of his wife), in which no matrilineal link is established. Likewise in Truk, a son is the potential heir of his father's lineage, and frequency of patrilocal arrangements as alternatives—transmission of the property on the establishment of a new property-residential group—does not always follow the strict matrilineal line. These facts point to considerable bilateral characteristics outside the household. The relationships among households are not organized upon the matrilineal principle.

Kroeber's emphasis on the bilateral character of the Zuni society should be regarded as important in this respect:

"Upon her (Zuni woman) permanent occupancy of the house rests the matrilineal custom of the tribe. But kinship is thoroughly and equally bila-

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

teral. Take away from the Zuni woman her possession of the home, and her apparent preeminence in relationship vanishes . . . (Kroeber, 1917, p. 48). The Zuni, a matrilinear and clan people, approximate much more nearly to the English scheme, as regards reciprocity and consistency in the use of categories" (*ibid.*, p. 81). 000

And Eggan observes that "Kroeber believes that common residence and friendship count for more than clan membership, in daily life at least" (1950, p. 186). Schneider and Roberts also touch upon the bilateral character of the Zuni and state that "in the formal sense in which the terms are used today, however, we must still regard Zuni as matrilineal in descent and not bilateral. Yet the Zuni pattern of integration is 'bilateral' or 'Ego centered' in type and not unilineal" (1956, p. 21). I rather suggest, in interpreting the Zuni situation, that the lineage principle is well maintained within a household scale, but that outside it, predominant bilateral tendencies come into action. Among the Nayar, also the relationship of outside *tarwad* do not show a unilineal structure.

In societies of the household-lineage type, a functional unit is demarcated in the first place by common property and residence, which cut off clearly other members who may be included by the descent principle. This demarcation is so clear-cut that the wider group, which may be recruited by descent principle, can hardly have a function in itself. The lineage, in the sense of wider descent units, may be vaguely seen, but its composition is immaterial to its structure. Hence the unilineal structural principle is much weakened, creating bilateral features beyond the household (property owning descent group). Therefore, the crucial difference between household-lineage and segmentary-lineage is the predominant bilateral characteristic of the former outside of the household, while in the latter, the unilineal structure inside of a household is theoretically extended to the wider organization, which may be regarded as a more rigorously structured unilineal system. The bilateral characteristics of household-lineage type correspond functionnally to the scheme of a bilateral system such as the Maori, as expressed by Firth who writes: "that descent and the formal structure of the kinship grouping can be understood only by reference to residence and land holdings" (1957, p. 4).

Fortes (1959), considering ambilateral descent groups, such as the Maori *hapu* described by Firth (1929) and the kind of landowning groups described by Goodenough (1955), in contrast to lineage type descent groups, expresses his view to designate the former type as 'kindred groups' and the latter as 'descent groups' on the ground that "This (the former) would emphasize the fact that they are not recruited on the principle of perpetual succession but on the more general principle of filiative kin right." The crucial difference is defined by

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi
Garo AR5

000 Fortes as follows: "it is the 'stock'—that is, the estate—and the function of the organization in the external politico-jural domain that make it a corporate unit, not the mode of recruiting members" (Fortes, *ibid.*, p. 212). The delineation of the unit which Fortes calls "kindred groups" is very much similar to that of household-lineage. A corporate group based on "stock" and residence is not only characteristic of bilateral society; it is also found in unilineal societies, but in them the unit is clearly always a "descent group" in Fortes' terms, though the external organization be different from the "descent group" of the segmentary system.

III

All matrilineal systems discussed above have a basic common structure: the composition of a corporate property group is structured by matrilineal descent principles. There are some peoples with a matrilineal system in certain respects, who do not share this basic common structure: the property group is not always composed of a matrilineal descent group, nor has it any institutionalized organization with a matrilineal principle of inheritance, such as we observed among the Garo. For instance, the Bemba, the plateau Tonga, the Bisa, the Ila, the Lamba in Africa, the Siuai of the Solomon Islands, and the Majuro of the Marshall Islands present such features; for the sake of convenience I term these *the Bemba type*.

9 171 182 611

The essential difference between the Bemba type and the other matrilineal systems discussed in previous sections, lies in the fact that though they follow the matrilineal *succession* rule, they do not always follow the matrilineal *inheritance* rule. In other words, though the membership of a *matrilineal group* is acquired by matrilineal descent right, the membership of a *property group* is acquired through ambilateral (not always by matrilineal) descent or affinal links. Hence, there are no distinguishable general patterns of internal structure of a property group as expressed by the criteria of two lines, *A* (female) and *B* (male). However, as a whole, property groups tend to bear more matrilineal features than that of bilateral systems like those of the Maori or the Iban, because of the existence of the matrilineal succession rule. Indeed, in some cases a property group consists of a matrilineal descent group.

In the absence of a strict matrilineal inheritance rule, considerable variations of residence pattern and composition appear within the same community. Virilocal, avuncolocal, uxorilocal and neolocal residences are found equally within the same society, as the residence pattern of a newly married couple is determined by various given circumstances.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

When classifying Majuro couples according to residence, Spoehr found 23 cases on the husband's land; 18 cases on the wife's land; 6 cases on land belonging to the husband's relatives in the household, though he himself did not have a right in the land; or 3 cases on land belonging to the wife's relatives in the household, though she did not have a right in the land. And he writes "this indicates a very considerable flexibility in the relation of household composition to land rights and residence after marriage" (Spoehr, 1949, p. 116). 000

Oliver found that the residence patterns in Siuai were subject to considerable variations. "Their order of numerical importance is: predominantly patrilocal; evenly mixed patrilocal and matrilocal; predominantly matrilocal; predominantly avunco-virilocal" (Oliver, 1955, p. 237). The more important factors entering into choice of residence are:

1. While a father is alive, his sons tend to set up their households in his hamlet.
2. If a man is wealthy and influential, both his sons and sons-in-law are likely to establish their households in his hamlet. In fact, the influential man exercises a strong pull on other relatives as well.
3. Upon a man's death, his co-resident sons and sons-in-law tend to move to their matrilineage centers, where their own maternal uncles may be residing, unless they acquire important rights in the deceased's landholdings.
4. A wealthy matrilineage or sub-matrilineage is also a magnet, resulting, in many instances, in matrilocal and avunco-virilocal residence.
5. Close friendship between kinsmen, especially between brothers and between classificatory *brothers-in-law*, frequently induces them to reside in the same hamlet. (Oliver, *ibid.*, p. 237)

Among the peoples which I classified into the Bemba type, the similar flexibility in deciding residence at marriage also appears in case of divorce or of death of a spouse. In such cases the one who has married into the group usually leaves, but the children decide themselves where they will go. In the case of virilocal arrangement, if the husband dies, the general heir chosen from among his matrilineal kin should assume his name and his position within the family, marrying his widow and fathering his children, which is a very similar arrangement to that of the Ashanti. However, the widow may refuse to marry her late husband's successor, either staying with her children and being allowed to retain her field, or going off to live as an affiliated member in the family of some relative (see Colson, 1951, pp. 127-128; Richards, 1950, p. 226). Thus, there is some tendency towards a matrilineal arrangement of the Ashanti type such as the widow leaving the house or the levirate derived from virilocal residence, but there are alternative solutions which contradict the matrilineal arrangement: the widow and the children may remain in the house and enjoy the property over which the deceased man's matrilineal kin have right. Thus the inheritance rule is very flexible.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

000 Such variety in residential arrangements and such flexibility in inheritance rule complicates considerably the composition of the residential unit when a property group (residential domestic unit) grows. Richards gives an interesting illustrative description of the formation of a Bemba residential unit:

> "The Bemba bridegroom starts his married life as a stranger in his wife's village, but since his daughters remain with him for some years after marriage he builds up a grand-family composed of his daughters, their husbands, and their children. In some cases he is able to persuade his sons-in-law to remain permanently with him, while in others he is even able to keep his sons in his own village. In time some of his sister's sons, with their wives, will choose to come and settle with him, so that he will be head of a group of rather heterogeneous composition" (Richards, *ibid.*, p. 227).

Here we find a man's wife's matrilineal kin (his daughters and sons, including the daughters' descendants); his own matrilineal kin (his sisters' sons); and the third matrilineal sets (his sons' wives and his sister's sons'wives). Such a mixed composition of a residential unit may never be found among societies belonging to those types previously discussed; such residential composition would be impossible if the matrilineal principle was functioning strongly in the structure of the actual property group.

Thus, the Bemba type presents an outstanding structural difference from the other types of matrilineal systems in which the matrilineal inheritance rule was the decisive factor for the formation of the residence unit. It is clear that in the Bemba type, both a man and a woman are fairly free from the economic control of his and her matrilineal group, and their relations are somewhat like those of the husband of the Khasi type and the wife of the Ashanti type. Therefore, the conflicts between one's matrilineal group and family of procreation are minimized, particularly in the economic sphere.

171 182 592 611

This analysis throws much light on the following remarks of Richards bearing on different aspects of the similar formation of descent groups among the Yao and the Bemba.

> "The head of a Yao village of this sort (taking his wife to his matrilineage residence) thus has authority over his wife's children and over those of his sisters, but the position of the wife's children seems to be clearly differentiated from that of the sister's children, and Mitchell speaks of a traditional hostility between them. I never saw evidence of such hostility in Bemba villages, which also often contain a man's children and his sister's children" (Richards, *ibid.*, p. 235).

This difference should really be ascribed to the structural difference between the Khasi type (the Yao) and the Bemba type. In the former the matrilineal structural force is strongly functioning in the residential group, whereas in the latter it is minimized.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

Within such a structural framework it is quite understandable that the predominance of virilocal arrangements, coupled with male authority as husband/father, are found. All observers of these societies have noted this feature. Among the plateau Tonga and the Bemba particularly, male authority is outstanding. 000

"Men are free to move and to form their own homesteads because they acquire rights over their wives which permit them to remove these women from the protection of their kin . . . As head of the household, the husband occupies a position comparable in many respects to that which falls to men in patrilineal societies" (Colson, 1958, p. 61).

"With the marriage the husband obtains—but only for the probationary period—rights over his wife's labour, the right to control her movements, and rights to her sexually. He is the father of any children born to her, whether or not he begets them . . ." (*ibid.*, p. 101).

"So long as the household contains a married couple, it is theoretically under the authority of the husband. The wife and her children form the house, the *inganda*, but the husband is known as the *singanda*, 'the owner of the house' . . ." (*ibid.*, p. 105).

"Once the young man is admitted to the family he is free to move his wife and children to his own village should he desire to do so" (Richards, *ibid.*, p. 225).

"This is a male dominant society and, even though descent is reckoned through the mother, the wife is very much under the control of her husband even while he is an outsider in his wife's village" (*ibid.*, p. 225).

The husband/father's authority was also observed among other matrilineal systems under certain conditions, as already fully discussed in the chapters on the Garo and the Khasi, and more predominantly among societies of the Ashanti type where the residential pattern was viri-avunculocal. However, the ambilateral structure on the level of the household composition may give more opportunity to create a husband/father authority of a more stable kind, unhampered by matrilineal force. K 9 171 182 593 611

Furthermore, individuals are almost free from the descent principle in establishing their residence. Colson states in her account on the Tonga that a man has complete freedom to choose his residence, and residents in a single neighbourhood need not have kinship ties with one another. In the ordinary round of daily life, membership within a neighbourhood may be of more significance than membership within a matrilineal group (Colson, 1958, pp. 27-28). Oliver describes a similar situation: 000

"The out-marrying women and their children acquire provisional rights in tracts where they reside, and ultimately acquire full title to such lands" (Oliver, 1955, p. 116).

It is clear, in these societies, that there are two sets of groups on different levels: a matrilineal group membership of which is acquired

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

000 through matrilineal descent right, and a residential property group membership of which is acquired through ambilateral descent right and actual residential right. The lineage and the domestic family of Majuro are not the same and should not be considered as synonymous (Spoehr, 1949, p. 160). The Tonga matrilineal groups which are conceived as persisting through time, are not localized and do not form the basis for the homesteads or hamlet (Colson, 1958, p. 61). The Ila recognize the difference between the domestic unit under the authority of the father and the descent unit of which the mother's brother is head. "The clan is your mother's, the family is your father's" (Richards, 1950, p. 240).

The matrilineal group seems to act as a ritual corporate kinship unit, and the residential property group as an economic corporate unit. Ethnographic data inform us about the matrilineal group as follows: a Tonga matrilineal group is "a corporate body since it has a common legal personality vis-à-vis all other similarly organized bodies. Inheritance, succession, provision and sharing of bridewealth, vengeance—though to a very attenuated degree today—and a common ritual responsibility, are functions of the group" (Colson, 1958, p. 16). In Majuro, the lineage is a landholding group and a basic feature of political organization; it also determines the ascribed status of an individual in the old class system, and constitutes a cooperating kinship unit (Spoehr, *ibid.*, p. 158). In Siuai, the matrilineage is a unit of landholding, possession and vengeance, with a common shrine and a common heirloom of shell money, etc. of high value (Oliver, 1955, Chapter 3).

These features would seem to indicate that these matrilineal groups have important economic aspects, which fact contradicts the existence of the property group composed of ambilateral descent with residential right. The answers may be, firstly, that the land-holding right of a matrilineal group is not of an inflexible nature; rather, it is nominal, and much concession is made to the actual co-residential group when a clash occurs between residential and descent rights. Secondly, at the different levels, these two groups, matrilineal group and property group, overlap in their distribution, so that in some cases both groups may coincide: the members of a property group form at the same time a matrilineal group. On these two points no anthropologist who has reported on these societies has given a clear analysis. However, I draw this conclusion from their ethnographic statements.

Spoehr sees in such coincidence of matrilineal group and residential group chance occurrences, resulting primarily from the fact that the living kinfolk in each case happened to fall into a lineage pattern. Interestingly enough, I find from Colson's and Oliver's accounts, that the bigger and more functional matrilineal groups are found as property

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

groups, associated with wealth. Among the Tonga, "wealth and power attract kinsmen. The largest matrilineal groups today are those which center upon one of the new class of wealthy farmers or upon a chief whose prospects of inheritance holds the members together" (Colson, 1958, p. 23). Oliver illustrates a case as follows: 000

"they (matrilineage people) interact among themselves . . . they corporately claim full title to all the tracts together and do not differentiate between the various tracts except to describe the several ways in which they were acquired.

It is important to comment on the oft-repeated statement of Soni and Siham that all this land will pass intact to their matrilineage descendants. 'Why,' I asked, 'will not other matrilineage acquire portions of it when you die just as you acquired tracts when former owners died?'

'The difference is that *we* are wealthy,' they answered. 'We are able to provide generous mortuary feasts for ourselves, and need not call upon other matrilineages to contribute; therefore, we do not have to throw away our land' " (Oliver, 1955, pp. 113-114).

In these societies, such matrilineal property groups seem to occur as a result of considerable accumulation of property which attracted kinsmen. Since they have a matrilineal system, one might be justified in approaching a wealthy man through the channel of the membership; in the same way, wealthy men may find in it a convenient excuse to delineate the members who enjoy their wealth. This economic reason seems important. Among the Bemba no strong matrilineal property group is found, and Richards states that "there is thus practically no inheritable wealth amongst these peoples, either in the form of land, stock, or money, and this fact naturally influences profoundly the nature of their residential and kinship groups" (Richards, 1950, p. 222).

I am, therefore, reluctant to consider that this kind of matrilineage corporate property group represents the traditional pattern of organization of this kind of society, and that other attending features are the product of its disintegration. I rather agree with Spoehr's view when he says: "I doubt that the present structure of the Marshallese household can be explained by the assumption that is changing from matrilocal to patrilocal residence, and I am equally doubtful that the family organization was ever highly formalized around maternal lineage" (Spoehr, 1949, p. 117). These matrilineal societies differ in structure from those discussed in the previous sections, but under certain circumstances, such as outstanding accumulation of property, they may become organized along the same lines as other matrilineal system. On another level the matrilineal descent group happened to coincide under most favourable circumstances with an actual property and residence group and formed a more effective and substantial corporate body. It is decidedly the most advantageous and effective way to build up a stronger corporate property group by using the

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

000 devices of the existing system. This does not necessarily imply that such societies have or had the same organization as other matrilineal societies,, but I believe this to be an economic and historical product of the existing structure. I do not question the fact that all these societies are subject to a process of change; but it does seem unnecessary to assume that every factor which happens to be missing nowadays, did, in fact, exist in the past.

K 9 171 182 611 000 Summing up the above discussion, the essential structural differences between the Bemba type and other matrilineal systems are found firstly in the internal structure of its property group: "ambilateral" contrasting with the "matrilineal" of the Garo, Nayar, Khasi and Ashanti types. Secondly, in the structure of the wider organization of the residential groups: the clear matrilineal principle is found to act in the composition of matrilineal groups. The focus of the matrilineal operation is quite opposite to that of the household-lineage type. In the latter the bilateral features are met with at the wider organizational level. In the Bemba type, in spite of bilateral features in the composition of the residential property group, the rigorous matrilineal group conception is found in the wider organization. Unlike the case of the segmentary-lineage type, this matrilineal group does not have necessarily a direct and actual economic basis. Perhaps the scale of the Bemba society is small enough to maintain the matrilineal social system without a definite economic basis.

In conclusion, such terms as "matrilineal" (unilineal) and "bilateral" are simply convenient labels for the preliminary classification: they should not be used as contrasting criteria for classifying social structure. The unilineal principle (matrilineal system) works differently in each given society, producing as I have observed different structures. Again, *descent* principle and *residence* (with landholdings or property) are equally important criteria for the analysis of social organization. The preeminence of either descent or residence should not be theoretically opposed in the arguments of anthropologists, for different degrees and levels of both factors are involved in each given society.

K 9 121 171 182 611 Finally I should like to note that the five major types of matrilineal systems in relation to the internal structure of the property group, which I presented in this discussion, namely the Garo, the Nayar, the Khasi, the Ashanti and the Bemba types, give theoretical criteria for the analysis. It should not be assumed that all matrilineal systems grouped into the same type present the same structure, but that each possesses the important basic element of its type. Also a system may change from one type to another through important economic changes or migrations: for instance, from the Nayar type to the Ashanti type, or from the Ashanti type to the Bemba type.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

APPENDIX

SOME ADDITIONAL INFORMATION FROM SHELLA AND JATINGA

SHELLA

Shella is situated on the lowest of the southern slopes of the Khasi Hills, bordering on the Sylhet plain of East Pakistan. For centuries the people of Shella maintained close trading connections with the people of the plain, so that they have been much influenced by the Hindu. They have been to some extent divorced economically and culturally from their own people who live in the uplands and on higher part of the slopes. Actually, this is a natural result of their geographical location. From Cherrapunjee, the southern edge of the upland Khasi Hills, only a narrow footpath goes down to Shella. The altitude of Cherrapunjee is about 5,000 feet and of Shella from 500 to 1,000 feet, and the distance between them is 8 miles. The path descends very steeply and is full of hard stones. This difficulty of communication is also why the Hindu influence did not penetrate the upland Khasi, as in the case of the Jaintia Hills.[1]

This area has a unique political organization which differs from the majority of Khasi states who are traditionally ruled by the members of the Siem clan. Shella is organized as a confederation, called 'Shella Confederacy,' and consists of four local villages. The head of the village is called *wadadhar*, and is elected by the villagers every three years. The number of households of the Shella Confederacy was about 900 in January 1956. The names of the four villages and their *wadadhar* in 1956 were:

Name of village	*Name of wadadhar*
1. Shella	Devish Mohan Roy
2. Mushtoh	Ditojou Roy
3. Nongtrai	Orju Roy
4. Tyngnger	Jabuni Roy

Each village is divided into sections. For instance, Shella village has nine sections: (1) Jasir, (2) Disong, (3) Duba, (4) Jamau, (5) Nongrum, (6) Nongnong,

1. However, Shella was the only way out and the main gateway from the Khasi Hills to the plain; it was here that the British first entered the Khasi Hills. They proceeded from Shella to Cherrapunjee and made the latter headquarters of the Khasi Hills in 1833.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

[Shella]

621 (7) Mawrongkhong, (8) Rynsong-kanor, and (9) Sholap, as shown in Map 9.
103 In Shella village the number of households in each section ranges between 10 and 80. Such a section is called *kher*, and was supposed to be the site of house-
614 holds of segments of every *kur* (clan). It seems that Shella village was once
621 composed of nine different *kur* which could intermarry with each other. However, nowadays, each section, as appeared in my census, has nothing to do with the
178 *kur* as such; it is simply a geographical section. According to the information which I gathered, there had been a tendency for the same *kur* people to gather
731 within the section, before the great earthquake in 1897 brought considerable

[102]

MAP 9. — *Distribution of Sections in Shella Village.*

damages and death to this area: many of them left the village at the time and many houses changed their sites in the village when they were reconstructed.
614 For instance, the composition of Jasir section in January 1956 was as follows:
621

Name of kur	*Number of houses*	*Name of kur*	*Number of houses*
1. Yuchyne	7	9. Lyngdoh	1
2. Iunei	4	10. Riang	1
3. Lorit	4	11. Nongtathiang	1
4. Synren	3	12. Loki	1
5. Ksaieng	3	13. Kanto	1
6. Nongbri	3	14. Kanti	1
7. Siem	2	15. Khelwa	1
8. Iunoi	2	16. ?	5
		Total	40

178 The people said that in Jasir, the Yuchyne was the most influential *kur*,
621 and must have been the original *kur* in this section. However, no clan solidarity could be observed. These seven households were socially and economically
614 quite independent of each other, as are all other households. As a whole, the importance of *kur* diminished a great deal in this village. Five households in Jasir were reluctant to mention their *kur;* some of them did not care about their *kur;* others were not themselves certain to which *kur* they belonged. The *kur* is losing its function to a great extent. This can be ascribed to the high degree of sophistication and mobility. However, except for one Siem woman who came from the uplands and married a man of this village, all 15 *kur* mentioned above are local clans frequently found within the Shella Confederacy. In
621 this area also community endogamy was predominant. Perhaps the Shella

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Shella

Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards 131
along the steep slope, looking down towards the Bengal plain. The climate
of this part of the hills is considered to be one of the worst in tropical India 132
for human habitation. The Bengal plain, though warmer than this area, is
considered more healthy. This border land is the zone of malaria, typhoid, 164
black fever, cholera, etc. None of the Bengalee peasants dare to live in such
an area. However, it is the most fertile for products such as betel-nuts, pan- 433
leaves, oranges, bananas and pineapples, and it also produces limestone. These
people seem to prefer to settle in this zone and to enjoy its prosperity, at the 164
expense of human lives: every year, especially between March and September,
the inhabitants suffer from various fevers and dysentry and other diseaes, many
of the weaker facing death. 648

Before the Partition of India and Pakistan, the products of Shella were 177
carried down the Shella River to Sylhet, one of the biggest centres in East 178
Bengal, which brought unimaginable wealth to the Shella people. Their houses
were built by carpenters from Sylhet. The style and structure of these houses 434
were exceptionally elaborate for the Khasi. They purchased vast rice fields [439]
in the plain, which used to be cultivated by Bengalee and Garo labourers [342]
engaged by them. These Khasi do not themselves know how to cultivate
rice fields; they have always been managers or landowners. Their boys used [166]
to be sent to high schools and colleges in Sylhet. As a result of their trading [464]
with the Bengalee, many of them read and speak fluent Bengalee. There is [871]
no difference between their style of clothing and that of the Bengalee, though [191]
the women maintain their traditional dress in the Shella style. [291]

They have thus been distinguished from the rest of the Khasi not only
geographically, but also economically and culturally. Their personality also
differs sharply from the rest of the Khasi. They are very sociable, and quick, 157
a quality lacking among the Khasi of Sohkynduh and Kongton. They are
clever enough to deal with strangers. The upland Khasi say Shella people 184
are very cunning. This remark shows one side of these people. They had to 648
be cunning, since they traded with the Sylhet Bengalee who were said to be the
most cunning of their race. Their role in the trade and in the history of the 177
modernization of the Hills was considerable. For centuries they represented 178
intellectual Khasi owing to their contact with Hindu civilization, while the
Hills remained in darkness. They assumed an important role when the British [439]
established an administration in the Hills, and even up to now, many leading
Khasi originated from this area: for instance, Lati Hat, the first interpreter
of the British Headquarters at Cherrapunjee; Jeebon Roy, who was the first
Magistrate among the Khasi; Maham Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jeebon Roy); Nichols Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nichols Roy), Principal of the Gauhati University, etc.

Through constant cultural contact with Hindu, and encouraged by their 177
economic prosperity, the Shella Khasi, like the Jaintias, have been much
influenced by Hindu culture. However, this does not mean that the people 648
of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, 771
and some ceremonial elements were borrowed from the Hindu, most of the 795

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

377 people remained non-Hindu in their basic beliefs and social customs. Hindu
648 influences are nevertheless predominant in their culture, especially in their way
771 of living which shows a practical adaptability, somewhat similar to the Japanese
795 acceptance of modern western culture without becoming Christian. In my
[797] census of Shella village, the people calling themselves 'Hindu' amount to 40 per
[162] cent of the total, but they are the recent converts to the Ramakrishna School which established a missionary station at Shella after the Partition. The Christians constitute 30 per cent of the total, most of them having been converted during the last ten years, as in the case of the Ramachrishna School.[1]
[458] The rest remain as they were, of Khasi belief. These conversions to either Ramachrishna or Christianity seem to have been encouraged by the unstable situation of the people resulting from the recent economic depression in this area.

439 The Partition of India and Pakistan in August 1947, which drew the bor-
458 derline a few miles south of Shella village, considerably upset village economy by stopping all trade with Bengal, though a limited amount of trade is allowed
648 with local people at the border. Because of this political change, all the produce of Shella gardens is rotting away for lack of markets, while all of the rice fields were taken by Pakistan. Goods now come to Shella only from the uplands, carried upon men's shoulders over the most difficult pass, which makes everything very expensive. Many families have sold their gold and other treasures, and some families are facing starvation.[2]

182 Concerning the conversion to a new religion, an interesting phenomenon
171 is to be observed. The conversion to Christianity or to Ramakrishna is mostly by individual: I found in my census that the wife and husband often belong to
592 different religions. This is a very different picture from the Garo, among whom I always found that the husband and wife belonged to the same religion: the
613 conversion of the husband to Christianity was always followed by that of the
771 wife. I think this reflects the structural differences which influence the actual relationship between the husband and wife. Among these Khasi, instead of
795 the husband and wife, the maternal uncle and his nephews and nieces are mostly of the same religion. The function of the *iing*, the most important social and religious unit, thus appears also in the conversion to a new religion, stronger than that of a domestic unit.

Intermarriage.

648 The close economic and cultural contact of the Shella people and the Bengalee
771 is not matched by social contact. The essential barrier between the two peoples is the difference of religion which dominates the entire social order in each
563 society. Though these Khasi were important traders, richer than the neighbouring Hindu peasants, they were considered by the Hindu as outcasts with whom they never shared social activities. Intermarriages were therefore very rare. In Shella village, only two exceptional cases were found in my census:

1. A Khasi woman married to a Gurka (cattle-keeper); they live at Shella Bazaar (Sholap).
2. A Khasi woman has marital relation with a Bengalee medical doctor who has resided at Disong in Shella for six years. He already has a Bengalee

1. These two entirely different missionary activities are competing with each other, and are somewhat related to the political powers within this area.
2. The state government is doing its best to provide them with additional facilities: for example, providing air transport for the transportation of oranges from Shella to Gauhati and Calcutta. However, such arrangements cannot cover the great economic loss suffered by the Shella people.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

[Shella]

wife who lives with him. The Khasi woman lives with her mother. Some say the Khasi woman is his second wife, other say their marriage is not recognized by the public. 563

Actually, owing to the bad climate, very few non-Khasi live in this area. Besides the two non-Khasi just mentioned, there were a Bengalee tax collector and an Assamese Forest Officer, both of whom lived at Shella Bazaar. Bengalee villages are situated about five miles south of Shella. Except in the bazaar, Bengalee and Khasi have no social contact with each other, and intermarriages have been rare.

However, it is obvious that in the past the Khasi must have had many cases of intermarriage with Bengalee. Among the Khasi, there is a clan called 'Dkhar.' The term 'Dkhar' is also used for the peoples of the plains: Bengalee are called 'Dkhar' by the Khasi. They say that the Dkhar clan originated in Bengalee girls who married Khasi men and who went to live in the Hills. It is said that in older days, the Khasi often raided the Sylhet plain and kidnapped Bengalee girls as well as goods. In Bengalee records of Sylhet, Khasi appear as 'bloody Khasi.' Khasi old men say that in order to increase their population they did sometimes kidnap Bengalee girls, but that they treated these girls very nicely and kindly, no differently from their own people. Since they follow the matrilineal system, they decided to name their descendants 'Dkhar.' It is said that all the present Dkhar people are descendants of such marriages. The Dkhar are found more on the southern slopes of the Khasi Hills i.e. among the Wars. 101 563

It seems there were many reasons for the descendants by marriage between the Khasi and the Bengalee to become Khasi. First of all, it is said that in the olden days the Khasi wanted to increase the population by such marriages. At the same time, a Bengalee who married a Khasi became an outcast from his or her own society owing to the caste system, and this inevitably made them Khasi. Secondly, the Khasi were primarily grouped into the *iing*, and they considered the marriage relation as of secondary importance. Hence it was rather difficult to remove by marriage a Khasi man or woman from their native place. Thirdly, Khasi could hardly live in the plain where no betel-nut or pan-leaf gardens were available; they could not engage in rice cultivation in the plain, as the technique is entirely different from the cultivation of betel-nut or pan-leaf. Moreover, they said they could not stand the heat in the plain. Therefore, the orientation of intermarriages was always towards the Khasi community: the Khasi brought outsiders to their own land; they did not themselves leave.

Such a marked tendency on the part of the Khasi to remain attached to their own homeland, is in no way contradictory with the phenomena of their migration to places outside the Khasi Hills, owing to the exploitation of their homeland and to the increase in population. The formation of Jatinga represents such an instance; there are also the cases of modern Khasi women from sophisticated urban areas, who easily leave their homeland, after marriage with a non-Khasi; this also appears in the following data on Jatinga. 161 167 [563]

JATINGA

Jatinga is a Khasi village situated in the North Cachar Hills, three miles west from Haflong, the headquarters of the North Cachar Hills. The number of households was about sixty in February 1956. Their economy depends on the pan-leaf, orange and pineapple gardens, similar to that of the Shella people. 131 621 433

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

621 [Jatinga]

[175] This village was founded in 1905 by Khasi immigrants from the Jaintia Hills. At the entrance of the village, a bust of the founder, Lakhanbang Suchiang, [101] stands facing towards the east; it was erected on the occasion of the celebration [211] of their Golden jubilee, in November 1955. Houses are scattered along the [346] ridge of the moutain to the east and to the west; in the centre is the church. [771] All the inhabitants are Christians. Before the Partition this was one of the most modern and prosperous villages in Assam.

Jatinga provides a very interesting instance of the Khasi 'colonial' village. 101 It is surrounded by villages of the Kuki, of the Zemi-Naga, and of the Cacharee, 121 who constitute the main population of the North Cachar Hills, and who are tribes entirely different from the Khasi, in economy, social organization, language 621 and culture. Therefore, Jatinga is like an island of Khasi community. I took this village as one of my fields, because I was particularly interested to discover how far the Khasi matrilineal organization is kept up in a community thus situated, surrounded by patrilineal tribes, and considerably modernized by Christianization and economic prosperity; and I was also interested in the process of formation of a new village, in comparison with Rinsibara and Joshipara in the Garo Hills.

Formation of the Present Population of Jatinga.

The first immigrants to Jatinga.

101 The main population of Jatinga, including the founder, originated in Bataw 166 village in the Jaintia Hills, twelve miles away from Jaintiapur, the capital of 175 the then Jaintia Rajas. This village is situated on the border of the Jaintia Hills and the East Bengal plain, the location being very similar to that of 621 Shella, as are their culture and economy. In the later part of the nineteenth century, some members of Bataw village moved to Borkhala, ten miles from Silchar, one of the biggest villages of the then Cacharee king.

These immigrants who came to Borkhala stayed there about fifteen years before they came to Jatinga. Kloribon, the first daughter of the founder's sister was born there. In November 1905, some Christian Khasi left Borkhala for Jatinga, acting on information gathered from a Welsh Mission at Haflong, that the land of present Jatinga was fertile and fit for their cultivation. They were the first immigrants to Jatinga. The Government record names the 166 following three persons as the first immigrants to Jatinga: Suchiang Lakhanbang, 551 Tariang, and Suchen Munik. In fact, according to the data which I collected at Jatinga, Suchiang Lakhanbang was accompanied by the following persons 614 (the names in brackets indicate the clans):

621 his wife, Misibon (Phanwar),[1]
175 his brother, Pryntah, and Pryntah's wife, Sintu (Rupsi),
his sister, Laptho, and Laptho's husband, Munik (Suchen) with their daughter, Kloribon, and Munik's younger brother, Sain.
his friend, Tariang.

Soon after their settlement, Sain, the brother of Munik, brought his wife Tahin (Suiam) from Jaintia. Misibon brought her younger sister, Diasibon. Tariang who came with Lakhanbang afterwards called his wife, Palong. But having spent some time there, they left eventually for another place, so that

1. Misibon was a native of the Cherrapunjee area of the Khasi Hills (not of Jaintia like the others). She was a school teacher at Cherrapunjee, and later became a teacher at a school near Jaintiapur, where she married Lakhanbang.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

there are none of their descendants in Jatinga. Summing up, the first party who settled at Jatinga was composed of people of the following five clans: 166

551

1. Suchiang — Lakhanbang, his sister, Laptho, and her daughter, Kloribon, his brother, Pryntah. 614
2. Suchen — Munik and his younger brother, Sain. 621
3. Phanwar — Misibon and her younger sister, Diasibon. 175
4. Rupsi — Sintu, the wife of Pryntah.
5. Suiam — Tahin, the wife of Sain.

Among them, Suchen had no female member. Phanwar had no successor: Misibon had no issue and Diasibon did not marry. Therefore, Suchiang, Rupsi and Suiam are the oldest clans in present Jatinga. Suchiang and Rupsi especially are the dominant and richest groups among the present population.

This was the time when the railway from Gauhati to Silchar was being constructed. Some Khasi labourers were working at Haflong on the construction of the railway. After the foundation of Jatinga, these Khasi workers established marriage relations with the Khasi of Jatinga, and finally, upon completion of the railway, many of them became the inhabitants of Jatinga. The present members of the Dome and Siangshai clans are the descendants of these people, and they form a considerable number of the present inhabitants of Jatinga. Besides them, there were a few other Khasi at Haflong who were engaged in trading business. In the course of time, they also had marital relations with Jatinga people and came to Jatinga. 166 175 458 621 [499] [464]

After five years had elapsed they found that in spite of their hard work the land was not favourable to them. Many of them left Jatinga. This was the hardest period of Jatinga history.

The second migration (1919-1925).

The railway which once had been blocked was reopened in 1919. The people who had left Jatinga came back to settle there. This time the circumstances seemed to them quite favourable. The pan trees which they had planted earlier were growing and they could gather considerable produce. The village grew bigger around 1920 as a result of new immigrants from Jaintia; most of them were people from Bataw, the village of the founder. In this period, many immigrants came from Jaintia not only to Jatinga but also to Sylhet, Borkhala and other places outside the Khasi-Jaintia Hills. It seems that by this time the over-populated Jaintia realised that these areas were favourable for their new home. However, the successive waves of Jaintia immigrants to Jatinga ceased by 1925, its population having reached saturation point. [499] [245]

Orange production brought economic prosperity to the people of Jatinga. Wealthy villagers employed temporary labourers from the Jaintia Hills every year. Some of these labourers came with their families and others came individually. During their stay at Jatinga, some of them married and settled there. Hence, there are also descendants of such labourers among the present inhabitants of Jatinga. [245] [464]

Some Aspects of Descent Groups.

Throughout the history of Jatinga, immigrations have always been undertaken by a family (elementary family, siblings) or by an individual, but never by a group of clan members. Therefore, the present population is grouped in small descent groups according to each migration. Though some of them happened to have the same clan name, their history of migration and their 621 [175] [614] [166]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

621 descent grouping are often different. This is a very similar pattern to the
[184] mobility which I discussed in Sohkynduh and Kongton (see p. 112).

One of the outstanding features in this community is the strong paternal
178 authority, established especially in the first generation, because the father's
593 (husband's) contribution was very important in such circumstances: their domestic units were completely independent from the *iing* either of husband
61 or wife. Some of them came with their wives, and many younger ones and their sons brought their wives from their homeland afterwards, thus practising
621 virilocal marriage.

They have an interesting social usage which reflects the importance of the husband of the first generation. This is the addition of the name of the husband of the first generation to the matrilineal clan name in order to differentiate each particular descent group established at Jatinga within the same clan. For instance, Rupsi-Tah, Rupsi-Loh, Rupsi-Khla and Rupsi-Lati are found in the Rupsi clan. Rupsi-Tah is one of the lines of the first immigrants to Jatinga, which I have mentioned as Rupsi: Tah was taken from Pryntah, the husband of Sintu (Rupsi) (see p. 171). Thus the present inhabitants of Jatinga are very conscious of their father or grandfather, though they strictly follow the matrilineal descent rule. From such a usage of naming a clan, the Indian officer, who gave me some information about Jatinga before I went there, made the mistaken deduction that they had changed from matrilineal to patrilineal, assuming this to have come about as a result of the influence of patrilineal tribes around Jatinga. But this is simply due to the fact, firstly, that they hold in high regard the man of the first generation, because of his great contribution; secondly, that they distinguish themselves from members of the same clan according to the descent group established at each immigration; in other words, it indicates each *iing* grouping in the village.

178 The fundamental Khasi social organization based on the matrilineal system
184 did not change at all. I could observe in Jatinga exactly the same principle in action as I had found in Sohkynduh and Kongton. The village endogamy
582 has also been well established in the present generation: there are about 20 different clans which can intermarry, and taking a spouse from an outside com-
61 munity has become very rare nowadays. Marriage patterns in relation to the *iing* structure and all its related aspects are surprisingly similar to that of the
621 communities in the Khasi Hills. The solidarity of the *iing* is even greater in Jatinga, particularly among the rich, because of the greater accumulation of wealth and greater economic activity, which also increases the authority of the *iing* as manager of considerable property—this was also the case with the Shella people. Jatinga demonstrates that in spite of colonization and of a significant change in economic activities, Khasi social organization has maintained itself intact. This situation is in contrast with the considerable social changes observed among the Garo community in colonial areas like Rinsibara and Joshipara.

621 ***Intermarriage.***

178 From the earliest period of the establishment of Jatinga up to the present,
582 some changing aspects of marriage patterns relating to intermarriages are to be observed.

563 As I stated before, in the earlier period, the people used to bring their spouses from their homeland, but they also married neighbouring tribal peoples, namely,
563 the Zemi-Naga, the Kuki and the Cachareе of villages close to Jatinga, and
621 also the Lushai, the Bengalee, the Moslem and the Anglo-Indian who lived in Haflong, the biggest political and commercial centre in the Hills, situated

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

[Jatings]

three miles away from Jatinga. As one may expect in such a situation, quite a number of intermarriages with these peoples appear in my census of Jatings. The resultant of these intermarriages was that when the couple and their children lived in Jatinga, they were considered to have become Khasi; otherwise they were held to be non-Khasi, whether the spouse was man or woman. This orientation of social recognition of the result of intermarriage was generally seen among Khasi in such situations, not only in the case of Jatinga. 563 621

The following are extracts of intermarriages from my genealogical table of Jatinga people. 563

591

A. Cases of intermarriages in which the descendants became Khasi. 621

1. A woman of the Dome clan married a Kuki man. All members of the present Dome clan at Jatinga are their descendants.
2. A woman of the Rymbai clan married a Kuki man as her second marriage. Their descendants are Rymbai.
3. A man of the Suchiang clan married a Mikir woman, and lived in Jatinga. They had one daughter who married a man of the Hua clan of Jatinga. They named this woman's line 'Shadap' as one of the Khasi clans. Later this Mikir woman's sister's daughter married a man of Rupsi-Lati, and their descendants were also named 'Shadap' by the villagers. Thus Shadap clan was created by a Mikir woman who married a Khasi man of Jatinga.
4. A Khasi man married a Lushai woman and lived at Aijal, the headquarters of the Lushai Hills. They said he became Lushai. Later a man of the Pajat clan of Jatinga married his daughter from Aijal. This couple lives at Jatinga and has several children. The villagers said they have to give them a new clan name. It is under consideration.

B. Cases of intermarriages leading to the emigration of Jatinga inhabitants.

5. A man of Jatinga married a woman of Zemi-Naga as his second marriage and lives at his wife's village.
6. A woman (the daughter of the woman of Rymbai, who married a Kuki: A-2) married a Moslem man and lives at Haflong.
7. A woman of Rymbai married a Punjabee and lives at Shillong. This woman is (B-6)'s mother's sister's daughter.
8. A woman of Siangshai clan married an Assamese and lives at Gauhati.
9. A woman of Rupsi-Tah married an Anglo-Indian and has gone to the United Provinces.
10. A woman of Jatinga married a man of Zemi-Naga and went to his village.
11. A woman of Jatinga married a man of Cachares and lived at his village some time, but she came back to Jatinga after divorcing him.

A cases belong to the earlier period when Jatinga had a shortage of population, while *B* cases, except 10 and 11, are found among the present younger generation. The population, which had increased rapidly in the last twenty years with economic prosperity, is suffering from the recent economic depression caused by the Partition as well as from the great damages done to their orange gardens and pan-leaf gardens by tree diseases. Moreover they have an unbalanced rate of birth according to sex: females are more numerous than males. Therefore, many daughters marry out as shown in the cases of *B*. The above-cited cases are only concerned with intermarriages with non-Khasi, but there are still other women who married Khasi men and who reside outside Jatinga, as for example, at Haflong and Shillong. [161]

In the village there are still many unmarried girls without suitable spouses. In the olden days, it was less difficult to marry neighbouring tribal peoples, 178 563 621

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

178 like the Zemi-Naga, the Cacharee and the Kuki. But after the period of
563 economic prosperity as I shall describe in the next section, the Jatinga people
621 reached a rather high level of education, while most of the neighbouring tribes
[871] remained illiterate. Their standard of living likewise improved. Fashionable girls of Jatinga who have studied at the Convent school in Shillong, and speak English and Hindi, cannot marry half-naked tribesmen who work in the jungle. They prefer to intermarry with Moslem, Panjabee or Assamese who belong to amore sophisticated community, and through whom they can enjoy urban life. Thus the orientation of the intermarriage of the people of Jatinga has changed, along with the growth of Jatinga.

It should be noted that intermarriages came mostly through the contacts at Haflong, where people used to go once a week for the bazaar, rather than through direct contacts with neighbouring villages.

Economy of Jatinga and its Relation to Neighbouring Tribes.

178 It is very interesting to find two different kinds of economy in the same
171 ecological background: Jatinga Khasi practise pan-leaf and orange cultivation
245 and depend mainly on a trading economy, while the other neighbouring tribal peoples practise jhum cultivation, almost a subsistence economy. This situation has remained unchanged for the last fifty years since the establishment of Jatinga village.

The first Jatinga immigrants occupied one ridge of the mountain where the
101 present Jatinga is situated. Formerly, this land belonged to the Zemi-Naga,
245 one of the old inhabitants of the Cachar Hills, who possessed a vast jungle area for jhum cultivation. It seems that there was no objection to the Khasi occupying this small spot: it was apparently too small an area for the jhum cultivator —pan-leaf cultivation of the Khasi requires less than one twentieth of the land of the usual jhum cultivation. The Khasi who started pan-leaf cultivation were able to accumulate some capital, and after several years they started orange gardens. They had had experience of orange cultivation in their homeland, but this was the first time they had operated commercially.

245 The success of this orange cultivation was beyond their dreams. Hearing
434 of good oranges at Jatinga, many Bengalee merchants from Dacca, Sylhet,
439 Silchar and Gauhati began to come to buy them. Moreover, the village had the great advantage of being situated near the railway station. Oranges were sold by carloads. Unimaginable wealth came to the Jatinga people. Especi-
[496] ally the founder's family, including his brother's and sister's, became extraor-
[871] dinarily wealthy; their income used to be Rs. 20,000 a year. The children were sent to the school which was established in the village and some were educated at colleges in Dacca, Sylhet and Shillong. The villagers had
[362] beautiful houses built by Manipuri and Bengalee carpenters. Actually the houses of Jatinga were known as some of the best construction in Assam.

Like the Shella people, they were managers of gardens and employed workers.
245 Wealthy households used to engage several labourers annually, most of them
46 from Jaintia where the Jatinga people had originated. These workers were provided with shelter in the servant quarters of their employer's house, but they had to provide meals for themselves. They were paid daily according to the work done. They were available to other households, when their employer had no work. Some labourers were also engaged locally among the Zemi-Naga, the Cacharee and the Kuki, though not as many as among the Jaintia.
245 These local tribes were fairly well occupied by their jhum cultivation, and not
464 used to being employed as workers. Therefore, most of them were not regular

15: Nakane E-5 (1955-1956) 1967 AR? Khasi AR?

workers and they were few in number.[1] They were particularly employed for such work as the clearing of jungle for new pan gardens in summer. 245 464

In the orange season (December to February) the number of workers increased and they were paid more: Rs. 1/8 were paid for one load (one person carrying 80 pounds of oranges, from an orange garden to the railway station—about two miles). Usually a worker made three to five trips a day. Many workers from Jaintia used to come for this particular season. 245 464 465

Semi-permanent workers were engaged for wet rice fields. They were usually Hindu cultivators: since these Khasi and other tribes do not know the technique of wet cultivation, plains people like the Biharee immigrants were engaged. These workers were provided with servants' quarters where they lived with their wives and children. However, very few Jetinga households possessed rice fields. 243 464

The economic prosperity of Jetinga reached its climax during the period from 1934 to 1940. Since 1941, the orange production has been decreasing. In 1945, a serious disease attacked the orange gardens as well as the pan-leaf gardens. Besides, by depriving Jetinga, as it had Shella, of their most important markets, Dacca and Sylhet, the Partition of India was Partition so very caused a serious economic depression in the whole region. On the other hand, because of the past prosperity, the population has rapidly increased during the last ten years. The serious economic condition of Jetinga is illustrated in the petition which was submitted by the Jetinga people when the Governor of Assam visited those areas in January 1956. It runs thus: 245 434 161 458

"Since the last ten years or so, with the increase of population in the village and with the loss of fertility of the soil, the people were faced with economic depression. At present they are facing acute shortage of land they have also no scope to adopt other forms of cultivation like jhooming and wet rice cultivation, etc. Moreover, there has been successive attack of Blight's disease which destroyed and wiped out all the orange and pan gardens. And as such, majority of the families have to depend for their livelihood on daily wages.

It is indeed a serious situation for them, because the Khasi do not produce staple foods, such as rice; their economy is completely dependent on the trade of their products by which they purchase their main provisions, clothes, etc. Other peoples round Jetinga, being jhum cultivators, can at least get rice and cotton: the minimum requirements, staple foods and clothing are available even in the worst conditions, so that they can at least maintain themselves though the standard of living is low. As I stated before, a few households in Jetinga possessed rice fields, but the majority had none. Recently they rented some plots of jhum field for rice cultivation from Zemi-Naga of neighbouring villages.[2] However, its yield was but a small percentage of their consumption. A few 182 434 [433] [243]

1. If they had worked in the gardens of Jetinga, they might have got more profit than from their own jhum fields. For one day's labour, they got Ans. 6/. For one month, they could earn Rs. 15 with which they could buy about 4-5 maunds of rice (one maunds paddy cost Rs. 3-4). For one year it became 30 maunds, which was impossible to produce in a jhum field by a single person's labour. [495]

2. These rates, including the figures of note 1, apply to 1956.

3. Jetinga villagers told me that Zemi-Naga were kind enough to lend them their field for a negligible rent, though they had not enough for themselves. Zemi-Naga said that they owed much to Jetinga in the past, so that now they sympathised with the conditions of Jetinga, and offered some parts of their jhum field. [427] [428]

15: Nakano E-5 (1955-1956) 1967 AR7 Khasi AR7

192 very wealthy households still maintain their former economic activities, but
434 the majority have been impoverished, becoming daily labourers for the wealthy
men or for road construction. Thus considerable internal economic differentia-
tion has begun to appear in the community.

Though the recent economic depression brought poverty to Jaintiya, the
192 standard of living is still strikingly higher than that of neighbouring tribes.
Studying such economic aspects of Jaintiya, I wondered at first why these
245 neighbouring tribes have remained as they were, except for temporary employ-
648 ment at Jaintiya, why, looking at the prosperity of Jaintiya, they did not adopt
the way of the Jaintiya people?

Indeed some of them attempted to imitate the Jaintiya economy, but the results were unfortunately not favourable to them. First, both pan-leaf and orange cultivations were entirely new to the tribal people, and the technique was quite different from that of dry rice cultivation on the jhum field. Pan cultivation requires very delicate care which is almost impossible to manage for people who have been accustomed to the primitive jhuming cultivation. For instance, when they go into pan gardens, they have to wash themselves and put on special clean clothes in order to prevent the spread of epidemic leaf-disease. Tribal people, who seldom wash their clothes, or mostly go naked, could hardly keep pan gardens. In this respect the Khasi are entirely different, having specialized in this economy for a long period, even as they believe, from time immemorial.

On the other hand, the technique of orange cultivation is much easier than that of pan-leaf, but it takes several years to obtain a yield, it requires considerable capital to begin with. For the jhum cultivators, who usually did not have such income nor funds, it was almost impossible to start it, while the Khasi were able to raise funds from the selling of the pan-leaf. Furthermore, the
[423] management of such gardens, either pan-leaf or orange, differs also from that of the jhum field as it entirely depends on individual enterprise based on private land ownership, which is new for those tribes where the community owns the land. Therefore the possibility of starting orange gardens is restricted to special individuals among them belonging to exceptionally rich and powerful households. A few households in neighbouring villages did, in fact, start orange gardens, adopting the technique of the Jaintiya people. This was around 1947 and they were expecting to have the yield around 1950. However, unfortunately, when their oranges began to come into production, orange disease started in Jaintiya and spread all over those areas. Their dream therefore never came true.

Besides oranges, some of them also established gardens of bananas, pineapples and papayas, which were more successful than the oranges. These plantations started much earlier than oranges in this area, though not in great quantity. The products were sold to the Jaintiya people who sold them again to Bengalee merchants. The question arises why were they not sold directly to Bengalee merchants, where the profit would have been much greater.

This aspect of the market economy touches upon very interesting problems
192 concerning the relations between tribal and Hindu peoples. Such tribal peoples
44 who live on a primitive subsistence level usually do not have direct contact
648 with the peoples of the plains. There is always an intermediary between them.
In this case it is the Jaintiya people who know both tribal life and Hindu life. They are also in between culturally. If a tribal cultivator sells his produce to a Hindu merchant, he would most certainly be cheated by the cunning merchant, as he is quite ignorant of trade. Tribal men do deal with markets directly, but only on a small scale at Shillong bazaar, and without making a profit, it is just the exchange of their basketful of jhum produce for an iron

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

spade or some dried fish, etc. Products such as large quantities of fruits should be sold to the Jetinga people who buy them at reasonable prices. 182

The Khasi are born traders. Too must be closely related with their economic technique, such as pan cultivation which makes it impossible for them to live without trading. Hence, though they are hill people, they have had close economic contact with the peoples of the surrounding plains. At the same time, some of them have had a very similar economy to that of other tribes, such as that of Sohkyndoh and of Kongton; hence they are familiar with tribal economy. On the whole, their dealings with the tribes as well as with the plains peoples are fair, though they are hard bargainers. Indeed the Khasi are quite welcomed by both sides. Thus the Khasi play an important role as intermediary between the tribes living in the hills and the Hindu (and Muslim) living in the plains.[1] 44 648

The economic contact is the most important of the many contacts between Jetinga and other tribal villages. Social contact, as opposed in intermarriages, is a rather marginal matter for the total population. Cultural contact is negligible. I only observed one indicator—some fashionable tribal girls sometimes wear Khasi women's dress when they go to the Mafiong bazaar. In their contact with tribes, the Jetinga Khasi speak Khasi which is the common language at Mafiong bazaar for all tribes and peoples in this area. A few men of Jetinga speak some tribal language, but none of the tribal speak the Khasi language. 648 182 [191]

In spite of such great differences in culture, economy and social organization, the relationship between the Jetinga people and the tribes has remained very friendly. For instance, as I mentioned before (p. 173, note 3), the tribes lent their land to Jetinga people who were suffering from a great economic depression. Their actual behaviour also reflects such a friendly relationship. It is said that at the time of the Golden Jubilee of Jetinga in November 1955, many Zemi-Naga, Kuki, and Cachareé came and performed their dances for the celebration.

1. The important role of the Khasi as intermediary is not only in the economic field, but also in the political and cultural fields: nowadays many Khasi officers are sent to tribal areas by the Government. They are very efficient in dealing with such work, because they are used to deal with both tribal and plain peoples.

NORTHERN UPLAND GROUPS

KHASIS[2]

Synonyms. *Cassia, Cossyah, Kasia, Kassia, Kassya, Kasya, Khasia, Khasiah, Khassi, Khassia, Khosia* 101

ORIENTATION. **Identification and location.** The term Khasi has often been applied to that entire 101 131 197 114 122

[2] This account of Khasi culture, contributed by Anna P. McCormack, is based on field work during 1956-58 in the United Khasi-Jaintia Hills District. The author wishes to emphasize that her data are on the upland Khasis who inhabit the center of the District. She gratefully acknowledges support of the field work from the Department of Anthropology of the University of Chicago, the Wenner-Gren Foundation for Anthropological Research, Inc., and the Ford Foundation, for one of its Foreign Area Training Fellowships.

group of matrilineal and Mon-Khmer-speaking people 101
who claim as their ancestral homeland the present- 131
day United Khasi–Jaintia Hills District (within ap- 197
proximately 90° 47′ and 92° 52′ E. and 25° 5′ and
26° 5′ N.). This group includes the Jaintias (also 101
Pnar or Synteng) in the southeast, who differ from 184
the Khasis primarily in their duolocal residence pat- 162
tern and less virulent forms of sorcery. (The Hadem 563
in eastern Jaintia are a Kuki people.) It also includes
the Lyngngams (also spelled Lynngam) in the west, 591
who practice migratory swidden agriculture and cer- 154
tain peculiar funerary rites, and are said by Ehren- 241
fels (1955) to be culturally intermediate between 764
Khasis and Garos. Finally, it includes Bhois, Wars, 114
and upland Khasis, which terms are primarily terri-
torial. Bhoi country is the north-central part of the
District, and is culturally complicated by the presence
of Mikirs, Lalungs, and Nepalis. War country spans [428]
the entire southern length of the District, so that
Wars divide into Jaintia Wars and Khasi Wars; of
these, the Khasi Wars have traditionally transmitted
property to sons as well as to daughters. The upland
center of the District is the country of the Khasis
proper, those whose culture provides the most useful
model for interpreting the variations found elsewhere.
[For general reference on all categories of Khasi cul- [113]
ture, cf. Costa 1936 and 1937; also Gurdon 1907,
especially for data on regional variations.] **Geography.** 133
The District is 5,554 square miles of hilly tableland, [131]
intricately dissected by numerous rivers, and marked
by significant ecological variation over very short
distances. The tablelands step gently downward north
from Shillong Peak, which at 6,445 feet is the highest
point in the District, and over about 55 miles ease
into the Brahmaputra valley where this is some 250
feet above sea level. To the south, the land slopes
more steeply downward for about 20 miles, and then
drops abruptly, in cliff and steep-slope formations,
to the Ganges sea-level delta that begins at its
north with Sylhet. The annual southwest mon- 132
soons drop torrential rains around Cherrapunji and
Mawsynram villages (for Cherrapunji, a record 805
inches in 1861), but then, reaching Shillong 33 miles
to the northeast, provide only about 100 inches per
year. Rainfall is again greater in Bhoi, which shares
the Brahmaputra valley climate. Climate is temperate
on the high Shillong plateau, where it seldom freezes
and never snows. To the north, climate becomes sub-
tropical, forest is jungly, and fauna abound. The cli-
mate to the south is also subtropical. [Cf. Hooker [113]
1891: chap. XXIX.] **Linguistic affiliation.** Khasi is 197
one of the major Mon-Khmer languages, related to
Mon, Khmer, Semang-Sakai, Nicobarese, and Pa-
laung-Wa. The major Khasi dialects are Khasi, Jain-
tia, and Lyngngam, to which Grierson adds War.
Further minor variations occur from village to village.
The Khasis had no script until 1842, when the roman [212]
alphabet was successfully applied to the Cherrapunji
dialect of Khasi proper. [Cf. Rabel 1961; Grierson [113]
1903-28: 2; Bareh 1962.]

1903-28: 2; Bareh 1962.] **Demography.** According to the 1951 census of India, the United Khasi-Jaintia Hills District contained 221,982 Khasis and 67,532 Syntengs, Pnars, and Jaintias (India [Republic] 1952-57). These figures, together with those for Khasis enumerated in Cachar (4,005), Mikir and North Cachar Hills (467), Lakhimpur (287), Sibsagar (276), and Darrang (211) districts, and those for Syntengs enumerated in Mikir and North Cachar District (464), yield a total of 295,224 Khasis. **History and cultural relations.** Khasis believe that they had supernatural origin in Khasi Hills (see Gait 1926: 260 for historical evidence, and Rafy 1920: 8-9 for myth, but see also Costa 1958, 1960; Gurdon 1907: 10-11; and Chatterji 1953: 12). Khasi tradition also states that in early times they moved gradually from east to west, from Jaintia toward Khasi Hills, in the practice of swidden agriculture (Gatphoh 1947: 97-98). The salient fact of known Khasi history, which begins generally in the mid-sixteenth century A.D. when there already existed the present-day 25 native Khasi chiefdoms, is the distinctive line of development followed by the separate kingdom of Jaintia. To the north, Jaintia was successively tributary, in part or in whole, to the Kachari kingdom (ca. 1230 A.D.), the Koch kingdom (strongest ca. 1560 A.D.), and the Ahom kingdom (strongest ca. 1700 A.D.) (Shakespear 1914: Map I). To the south, about 1500 A.D., Jaintia extended its rule over a tract of Sylhet, which was populated by Hindus and Muslims, and saw its kings fall thereafter under Brahman influence. In the early 1800s, Jaintia became involved in the fratricidal strife then prevalent in the ruling family of Manipur. In 1835, after the Jaintia king ignored British warnings not to seize British subjects for human sacrifice, Jaintia was punished by the British annexation of the Jaintia parganas in Sylhet. The Jaintia king then voluntarily turned over to the British the hills area of his domain, so that the whole of Jaintia became part of British India and, in 1860, came to be taxed as such, although the Jaintias were otherwise allowed to maintain their traditional system of village government. • By contrast, the remaining Khasi states had few formal external relations until British times. Khasis raided and traded in both the Brahmaputra and Sylhet valleys, but were basically turned inward on their own hills, where warfare between villages and between the states was apparently common. Khasis came into indirect relation with the British in 1765, when Sylhet and its markets became part of British India. In the 1790s, stepped-up Khasi raids into Sylhet caused the British to throw up a deterring line of forts along the foothills. Later, it became necessary to place an embargo on Khasi products in the Sylhet markets. In 1827, the British penetrated into western Khasi Hills by negotiating with the Khasi chief of Nongkhlaw State to build a road through his territory, linking the recently annexed Brahmaputra valley with Calcutta. For three decades

thereafter, the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contracted that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, judging cases of heinous crimes, approving the popular selection of any new chief, and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life, and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Mills (n.d.): (1) The British introduced the potato, which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive specialization exhausted the soil and made for ever-poorer crops. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should inherit property that traditionally was earmarked for her performance of non-Christian religious rituals. (3) About 1864 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to marry with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the accelerated enrollments in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the Independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi–Jaintia Hills District became a Part B, or Autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The native-state system and the chiefs still exist, and the District Council finds it difficult to effect legislation which is neither offensive to regional custom nor a simple blueprint of ill-fitting all-India legislation. The major political schism at this time is between Jaintias, who are accustomed to centralized authority and taxation, and Khasis, who resist the notion of taxation to support the work of a central District Council. [Cf. Gait 1926; Aitchison 1931; Bhuyan 1949; Morris 1910.]

175 619 648 [726] [651] [177] 177 648 [244] [439] [134] [797] [428] [635] [633] [167] [563] [423] [873] 648 642 [651] [563] [113]

SETTLEMENT PATTERN AND HOUSING. **Settlement pattern.** Khasis live sedentarily in named, nucleated, and unplanned villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a de-

361 [312]

pendable water supply. Villages are about two to five miles apart, and have no boundary markers. In the past, villages contained semipublic buildings and grounds: the home of the village priest (also the home of a chief if he resided in that village), the village marketplace, and tree groves, cremation grounds, or other awesome spots that were believed to be inhabited by supernatural beings. Villages today may have also one or more Christian churches, government social welfare buildings, and schools. Formerly, villages were entered through a guarded gateway; this is no longer the case, and paths feed into villages from all directions. Often several villages are nucleated into one large unit, named and also described as a "village." These were once defense units, but were so uncohesive otherwise that institutionalized rivalry obtained among the component villages. Now, they have been integrated through the agency of all-village public services, especially schools. **Housing.** The traditional Khasi house is entered through a door at the rounded end of a U-shaped ground plan, and is about 20 feet at widest extent; it is about 30 feet deep, and is elliptical or hogback in profile. Its walls are of stone blocks cemented with mud. The roof of grass thatch, supported by a bamboo frame, overhangs the walls on their outside, down to about three feet above the ground. The house is divided into two parts: the front one-third is on the ground level, floored either with stone blocks or tamped earth, and is used for storage of occupational instruments and as a shelter for poultry. The rear two-thirds is raised four feet on piles of stone blocks to a platform of planks, and is partitioned into six rooms, comprising a kitchen, areas for storage of food and water, and sleeping quarters. Furniture is minimal, and the house is totally undecorated. There are no windows, and no smoke vents. A house generally has a companion shed, walled of wood and grass matting and thatched with grass. This serves as a pigsty, but it may be partitioned also to house cows, and it may have a loft for fuel storage. Compounds often contain garden plots, and are fenced around with stone or bamboo and mud. Nowadays, the traditional house has given way to Western-style bungalows of wood and tin, especially in and around Shillong. [Cf. Mukherjee et al. 1941.]

ECONOMY. The Khasi economy is a market economy based on agriculture, and most Khasis are primary producers, sellers, middlemen, and/or providers of services in connection with markets. Khasis are often multioccupational: they produce goods for partial subsistence, and also play some part in trade. **Agriculture.** On the Shillong plateau, the major field crops are potatoes, maize, millets, and dry rice, still produced mostly through swidden farming, with a two- to three-year period of fallow, but increasingly through continuous use of a single field with the aid of ma-

16: McCormack E-4,5 (1956-1958) 1966
[P. 108A] AR7 Khasi AR7

more and chemical fertilizers. Both level land and 241
hillsides are cultivated by the same hand techniques.
3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the soil is sown, either broadcast or sown with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double
crop as well. Paddy has long been found in the 243
lowlands, in parts of Jaintia and Bhoi, the only 184
places where the plow is found. Nowadays paddy is 178
more and more seen in the uplands, together with a simple terracing and irrigation technology. Many
upland Khasis have house gardens in which they 244
raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant,
and many others. Important crops in Bhoi country 241
are paddy rice, lac, cucumbers, cotton, bananas, and 187
pineapples, in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fish-
ing is done by spearfishing, dynamite, bait, dam, or net. 226
Commercial activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, 224
including spring guns and pitfalls, but was always primarily a sport. [Cf. Stagmuller 1928.] **Gathering.** 222
Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is
no real dependence on gathering. Medicinal plants (278)
continue to be very important. **Domestic animals.** 231
Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is (230)
now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some
also receive prepared food. Cattle and goats forage (233)
freely in the fields during the winter, but are herded by a communally hired herdsboy during the agri-
cultural season. Most households keep chickens, pri- (235)
marily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for
hunting dogs. Cats are popular. **Food and stimulants.** 262
The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled
beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the 264
morning and evening, although farmers also take a midday meal in the field, and others may take tea
and cold sweet potatoes or rice bread. Certain foods 262
are taboo to certain sibs. Stimulants are extremely 184
common, especially betel nut, which is often ac-
companied by a bit of tobacco. Tobacco is also 276
smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, 273
where distilled rice whisky is cooked and sold by the 275
glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls 276
instituted in the 1940s have been fairly successful. 177
All stimulants were once taken by men, women, and

16: McCormack E-4,5 (1956-1958) 1964
[P. 108 B] AR7 Khasi AR7

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chilies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stegmiller 1964a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

clothing, operate the large Khasi business establishments in Shillong, and provide all civic and religious leadership. Women care for children and for the home, do the marketing, and sell dried fish, betel nut, lime, fruits, and rice beads at markets. Other tasks can be performed by either sex. Land tenure. Land was formerly divided into sib land and public domain. Sib land was corporately held in perpetuity and was inalienable except by the unanimous consent of all members of the sib. The public domain was subject to usufructuary right by anyone who kept the land regularly under habitation or cultivation, with a lapse of no more than three years. Most villages grew up on public domain, and then reclaimed all land inhabited or under cultivation by a village member as village land. Forests were public, except for sacred groves possessed by villages or lineage groups, and everyone was free to gather branches for fuel. Wastelands and streams were also public. By now most public domain and village land, together with its forest cover, has been pre-empted as private property and is being rented and sold as such. Sib lands remain intact, unless the sib agrees to rent, lease, or sell. [Cf. Gurdin 1904.]

(71)

KIN GROUPS. Descent. Descent is matrilineal, and the Khasi is a member exclusively of his own matrilineage from birth to death. Adoption, which is very rare, is only within the matrilineage. Kin groups. The maximal matrilineage is the sib, this is a named, widely dispersed, strictly exogamous, lineage group, which claims but cannot trace its origin from a single ancestress. Sibs tend to meet as corporate groups from time to time. Some sibs are linked with others in large amorphous groups that are unnamed and are defined solely by exogamy. Such a group is composed of two or more sibs, the ancestresses of which are claimed to have been either real sisters or close friends who out of affection declared that themselves and their descendants would be as consanguineals. The origin and function of sib-linkage is now unknown, and today the members of a sib will often disagree on whether or not their sib is linked with another. • The minimal matrilineage is the local descent group, or ing. This is the largest kin group that normally collect at life crises. It is said that the ing formerly spanned six generations; today, it encompasses only four. If an ing grows to more than four generations in a single village, it separates. New houses are located at some distance from the old and the ing soon forgets exactly how to trace genealogical connection, except for which separate descended from a youngest sister. The term ing may also be applied to an extended family, an elementary family, and a house. The elementary family is the basic domestic unit in Khasi society. In any village there are likely to be one or two households which stand as sole local representatives of the lineage of the female household head. Such a household is known as an

MARRIAGE AND FAMILY. Made according to the traditional courting pattern, a group of young male relatives and female male nightly visits to the house of some virgin girl in another village, approaching her through basins while she and her parents [illegible] there, and staying the night to avoid the dark walk home. Marriage was according to the wishes of the parents after negotiation by a go-between from the boy's side. Girls might be 15 and boys 17 years of age. Girls have now acquired freedom of movement through attending school, however. Premarital sexual play is common, and young people choose their own spouses when the girl is about 18 and the boy 21. The most common mode of marriage is elopement, for Christians and non-Christians alike, but some Christians marry in church, and some Khasis still marry according to the traditional ceremonies or some variation on it. There are no preferred or prescribed marriage types, nor is there a bride price or dowry. Fame, Monogamy is the ideal for all. Examples of [illegible] are exceptions. Other prohibited marriage partners are real and classificatory FaB and FaSi, FaBoCh, FaSiCh, and FaMoSi. The MoBoW is also prohibited, for [illegible]

carribar. In other words, a state is not a fixed territorial entity. In the early twentieth century, the most populous of the 18 chiefdoms, Khyrim, contained 30,322 persons occupying 7,800 houses in 372 villages, and the least populous, Nongkhrai, contained 240 persons occupying 53 houses in 3 villages. Fifteen of the chiefdoms were headed by a *syem* (chief), three by a *lyngdoh* (priest), six by a *siñar*, and one by a *wahadadar*. These leaders all had executive and judicial functions, but a chief's authority was limited in that he had to obtain the approval of his executive council before acting. The other leaders were subject to a similar limitation. A chief maintained a small police force. His major sources of revenue were market tolls, fines, and, more recently, income from licenses to distill rice whisky. Succession to a ruling role in the larger states traditionally involved election by members of a lineage that had a hereditary right to elect, from among members of a lineage that had the hereditary right to rule. In British times, the election basis was broadened, differentially in the various states, even to the point of popular elections. [Cf. Ardhawn 1935, Lyngdoh 1962.] Social stratification. The three classes of lineage are the nobles, the commoners, and the slaves or servants. This stratification applies only to the recruitment to office in the native-state system, for there is no hereditary; and in a village assembly everyone has equal voice. The noble lineages have the hereditary right to fill from among their male members roles such as village or state priest, councilor to a chief, or elector of a chief. The few lineages which today are remembered as slave or servant lineages had the inherited obligation to render special services to a chief's household. There is no Khasi term for "commoner." Every lineage other than a noble or a slave lineage is a commoner lineage, and the commoner lineages are in the majority. Warfare. Warfare was suppressed by the British, and little is known for certain about its traditional form. The tactics which confronted the British were the ambush and the guerrilla raid. Traditional goals included taking heads from other Khasis and capturing women from the villages.

RELIGION. Major and indigenous religions. A Welsh Calvinistic Methodist missionary penetrated into Cherrapunji in 1841, and the work that he began continues to this day. His society, which has since become the Welsh Presbyterian Foreign Mission, introduced writing, village primary schools, a high school, a theological seminary, and a hospital. Competing missionaries followed, and by 1914 some thirty Khasis were preaching over the hearth set aside of traditional Hinduism and Islam but also of the Buddhism, Brahmo Samaj, Arya Samaj, and Theosophy (Rev. 1914). By the 1920s, missionaries of the Church of God and the Seventh Day Adventists were

797
17

also active, and in that decade one U Kyrhai, a Khasi 797
convert to Presbyterianism, left that church and
founded a unique sect that blends something of himself with something of mystical Hinduism and Christianity. The competitors who most seriously threatened the dominance of the Welsh Presbyterians were the Roman Catholic missionaries who arrived in Shillong about 1890. Catholics have since opened a number of high schools, colleges, convents, and orphanages. They also established a technical school, and are now constructing a seminary. At the present time, 779
one estimate is that there are about 100,000 Presby- [162]
terians and 50,000 Roman Catholics among Khasis. Members of other Christian sects are comparatively few; adherents to Hinduism and Islam are fewer still, comprised chiefly of Khasi women married to Hindu or Muslim men. U Kyrhai's sect is dying out, and the balance of Khasis are, according to their own
terms, "Khasi" in religion. [Cf. Lyngdoh 1937, Morris [113]
1949, Bropney 1940, Singh 1960, Pugh 1961.] Supple- 776
mentals. The great deities are two, an unnamed masculine God (U Blei) and an unnamed feminine Goddess (Ka Blei Nongpyniaiar Nongkhrum). God 771
created the earth, and in the beginning instructed 773
man in cultivation techniques and also laid down the framework of a moral order that should guide his every move if he wished to join God in heaven after death. This framework was then filled in by the first ancestors, who are therefore the authorities on the subject and are unidentified as Ka Iawbei (the mother), U Thawlang (the father), and U Suchiin (the mother's brother). Very early, Goddess undertook to keep account of the numbers of human beings on earth, and this role was so important, relating as it did to the health and the multiplication of the people, that she became of major importance in the Khasi pantheon. When sin beset human society, God ordained automatic punishments in the form of natural calamities, and man finally decided that some
animal should go and intercede with God on behalf of humans. The cock went, agreed to take upon himself the burden of human sin, and received instruction in the correct divinatory and sacrificial techniques for which he would be one of the main objects of the trade. Again, over a period of time, it was the ancestors who perfected these techniques. Now, God is regarded as powerful and merciful, but passive. His punishments have their own impetus, and the expression of His mercy is solidified in ritual. Goddess is more vaguely conceived, but is much closer to the individual. [See cf. Khoombah 1960, who conceives of
one double-sexed, great deity among Khasis.] Suggest- [114]
ing uncertainty, it is never clear from prayers whether 776
supplication is to generalized ancestors or to par- 771
ticular first ancestors of a Khasi's own matrilineage, (769)
and such a distinction seems not to matter. There are
three other categories of minor deities: those who
protect places (such as villages, groves, or springs),

household deities, and measles and smallpox deities. 776
Deities of the first two categories are simply aspects
of the high God or Goddess. • The earth is peo- 971
pled with two great orders of land demons and
water demons who cause all undesirable, unnatural,
and otherwise inexplicable events, acting either on
their own or as instruments in the hands of sorcerers.
Apart from omens, both in nature and in dreams, 787
Khasis attach supernatural significance also to mystic 822
numbers, and to the colors white, black, and red.
They hold especially important folk beliefs regarding 824
betel nut, paddy rice, gold and silver, and clothing.
Practitioners. The two classes of religious practition- 701
ers are the village or state priests and the sacrificers.
Both are male. They use the same divinatory tech- 753
niques of reading broken eggshells and the entrails 754
of cocks, and they both sacrifice cocks, hens, goats,
pigs, and cattle. Their skills are not taught to them
so much as picked up by observation and confirmed
by demonstrations of efficacy. A priest is elected
from among the men of his sib to direct his skills to
the public good until he dies, and his rewards are
institutionalized and come from the village or the
state. A sacrificer acts for private persons or his
groups, as call, and is rewarded by them personally
with gifts in cash or in kind. The sacrificer is called
upon to explain and then to ritually remedy every
variety of misfortune, especially illness, though his
powers are nowadays regarded with ambivalence,
and he is widely expected to become a sorcerer
sooner or later. • There are two major types of sor- 754
cerer. One is the ritual specialist or sacrificer who
secretly turns his skills from good to evil, manipulat-
ing demons to injure a person or his group, and
acting always for himself alone out of considerations
of jealousy or revenge. The other is normally a lead-
ing citizen, a woman who is so wealthy and success-
ful that it is believed that she must keep a shiu, i.e.
a creature which will bring her prosperity so long as
she feeds it periodically with human blood. To pro-
vide this blood, the men of her household, or other
males whom she bewitches with a special whisky,
will indiscriminately murder anyone except a mem- [P 8v]
ber of her sacrificeage. The Jaintias have an ana-
logue to the shiu in their tiev, except that the
ultimate result is death from illness rather than
murder. Minor witchcraft can be perpetrated by
poison keepers or persons with an evil eye, who are
often women. Ceremonies. The important traditional
ceremonies were the life-crisis rituals relating to
pregnancy and childbirth, the naming of a child, and
death. Lesser ceremonies related to marriage and
divorce, and to housebuilding. All these rituals were
addressed primarily to the ancestors, and they are
still performed in modified form by many Khasis.
Other rituals, which were performed by groups such
as villages, sibs, local descent groups, or households,
were addressed to the ancestral aspects of the high 782

God or Goddess, deities regarded as helpful in bringing prosperity, producing fertility, and so on. Rituals of this kind are no longer practiced, except for the Bedinghlam ceremony designed to protect the Jaintia village of Jowai. Finally, the state religion of many chiefdoms was expressed in one great ceremony per year which was intended to secure ancestral blessing for a chief and his lineage, and, through this, for the entire chiefdom. The notable example, still practiced, is the Pomblang Syiem of Khyrim chiefdom. [Cf. Lyngdoh 1937, 1946, Stepanoff 1954b, Becker 1936.] **Illness and medicine.** In time of illness, a Khasi calls in a sacrificer, and possibly also a medicine man. The medicine man is an ordinary individual who has hit upon some herbal remedy for one or more ailments, who has become famous enough to be sought out and rewarded in cash, and who jealously guards the formula of his medicine until it dies with him. He and his patients tend to regard him as specially blessed. **Soul, death, and afterlife.** The universe is comprised of a heaven, the earth, and the air between. Heaven is where the souls of deceased mortals live in eternal peace, grouped ab by ab. The earth and all nature were created by God, and everything that God created has its own individual soul. There is no other great earth deity, for it was God who created the earth. The air is inhabited by the wandering souls of those dead for whom full death rites were not performed. A Khasi's potentiality for enjoying an afterlife in heaven with his ancestors depends on his receiving proper death rites at the hands of his ab mates. First, his body is cremated by his children, notably his youngest daughter, and his bones are collected and deposited temporarily in a small stone receptacle. All work stops in the village while everyone participates in the funeral. Once every several years, an entire ab gathers to witness the transfer of the bones of recently deceased ab mates from their temporary receptacles to the great ab cairn that is in the keeping of the youngest daughter, descended from the ab ancestress through a line of youngest daughters. This final ceremony covers five days, and is elaborate and expensive, but when an individual's bones are finally resting with those of his antecedents in the cairn, it is understood that his soul is finally in heaven, "resting hand out in the house of God."

THE KHASI FESTIVAL OF 'POMBLANG'

S. BANERJEE

INTRODUCTION

The Khasi inhabit the upland of the central part of the United Khasi and Jaintia Hills district of Assam. They reckon descent through mother and the youngest daughter (Ka khadduh) of the house is the custodian of the ancestral property. Belief in the existence of spirits is strong among them and the causes of diseases are ascertained by taking recourse to the process of divination. They are ruled by different categories of Chief. The *Siem* is the highest official responsible for the administration of the state but a few small states are also governed by *Sirdars* with same powers as vested in the former although does not possess the same status. It is interesting to note that their priest whose rank is next to *Siem*, have also been allotted to perform this secular duties in some of the regions of the Khasi country. The Chief function through their respective council comprising elected members from different administrative units. He is rather subservient to this body as he is liable to be censured or even dismissed, if his activities are not in conformity with the Khasi traditional usage. Most of his directives are implemented through the assistance of his subordinates who are in-charge of various sections of the State. The Khasi place his grievance first to these junior officers for redress and justice, after which an appeal can be preferred to the *Siem* or any other higher officer as the case may be. One of the eminent States of the Khasi people known as Khyriem, where this festival is celebrated, consists of eight units for administrative convenience under the supervision of different grades of officials who participated in this celebration along with the *Siem* as representatives of the people.

The Khasi festival of *Pomblang* (Goat killing) described below used to be celebrated at one time in Shillong when the Khasi states of Khyriem and Myliem were not separated. The first chief of the Khyriem state U Singh Manik shifted his headquarters to Nongkrem village after partition of the kingdom, which occured before the arrival of the British. He again moved to Lanekerdem after a brief stay at the village of Lyneshing. He performed this festival as long as he was there, transferring it again to Nongkrem where he re-settled again. It was celebrated here for a long time and consequently it was named after this village. Although the ruling family had later on shifted its residence about sixty years ago to the present village Smit, during the time of U Klur Singh, Siem, it is performed regularly as *Nongkrem dance* which was observed by the author from 21st June to 25th June, 1955.

OBJECT OF THE FESTIVAL

It is being held every year since the days of U Shillong who was supposed to be the founder of original Khyriem State. They celebrate it to perpetuate his memory and pay homage with a view to ensure rain, good harvest, eliminating diseases and famine. He was worshipped along with other ancestors with view to guide the present Chief in his discharge of his duties and for the welfare of the people.

The house of Siem (iing-sad) where the rites are observed, is considered sacred. It consists of a big-hall (shlur) in the centre, surrounded by rooms. One of these on the north is used as a kitchen room (iing-chetja) where ritual

17: Banerjee E-5 (1955) 1962 AR7 Khasi AR7
Smit

778 objects are stored while that of the west (kynram blang) was meant exclusively
796 for sacrificial goats. There is a very big circular courtyard in front of the building where the members of the royal family as also other boys and spinsters
[193] hold a ritual dance. The function is always held during the moonlit period of
[443] May or June and the actual dates are fixed in consultation with the Chief priest (*Sohblei*) in such a way that the first day—*Pamtiah** always coincides with the market day of Shillong Chota bazar. The dates of the festival is then co-
[202] mmunicated to the in-charge of different units of his territory, through a wooden stick '*kyrwoh*' having a few knots of cane-strips, as a form of summons for attending the festival for five days at Smit along with subjects under their jurisdiction.

IMPORTANT PARTICIPANT

796 The responsibility of performing this ritual rests on the High-priestess
793 (*Ka Siem Sad*) who is succeeded by her eldest daughter. Different ritual objects are procured by her, well in advance and it is obligatory on her part to
562 join the ceremonial dancing, in which her daughter may also officiate on her
[769] behalf. U Shillong is worshipped by the chief priest while the other ancestors
[533] are invoked by lesser priests. The musicians (*Dhulia*) besides their normal duties, take part in the worship of the ancestors and they are presented with silk turban, jacket, cloth, by the ruling family for the services rendered during the festival. The *Siem* has no especial role except to supervise and evoke U Shillong for the welfare of the community. He is required to perform certain sacrifices, failing which his heir-apparent (*Siem kynsah*) does the same. He along with his sister (High priestess) abstain from taking rice during the period of celebration presumably to observe the sanctity of this festival as also to ensure the successful conclusion of the function.

RITUAL MATERIALS

796 The festival derives its name from the sacrifice of a large number of goats
782 some of which were supplied from the State fund and from different units of the territory. Formerly at least fifty goats were required and each unit had
231 a specific allotment but owing to the economic difficulty that the Khasi are experiencing, the number of goats sacrificed hardly exceeds twenty-five. The goats collected from the different units, are presented to the Chief at the midnight
[273] of the third day. Rice-beer, dried fish, fermented-rice, betel leaves together
[276] with nuts are also important ritual objects in this celebration.

DESCRIPTION OF THE FESTIVAL

796 The commencement of the festival was marked by the distribution of dried
782 fish (suit dokha) to the persons assembled on the occasion, in the evening of *Pamtiah* (*i.e.* 21st June, 1957). This was followed by the dropping of rice-beer by the Chief priest over the fire place of central hall known as *Ka suit-ka char*

[805] *A week consists of eight days in Khasi. Calendar the names are according to the places where markets are held in Khasi Hills.

Name	Market
1. Pamtiah	Shillong Chota Bazar.
2. Umai	Jowai(pnsi).
3. Yew-dah	Shillong Diaro Bazar.
4. Lyngka	Jowai(pnsi).
5. Kongkrem	Kongkrem.
6. Mawlong	Laban (Shillong).
7. Ryngkep	Jowai(pnsi) Chota Bazar.
8. Shillong	Lumjing fish.

17: Banerjee E-5 (1955) 1962 AR7 Khasi AR7
Sinit

in which no sacrifice was made except this libation of this liquor in the name of U Shillong, Ka Blei Long Siem and U Suidnia. Subsequently, the Chief musician (Dhulia) worshipped another deity Ka Synchar, by holding a yellow cock in front of ritual offerings collected on a plantain leaf while his subordinates immediately shouted nine times in their traditional way. Redistribution of dry-fish and indigenous liquor to the people marked and the end of the first day and the ceremonies performed on this day were repeated on the second day (Umni). 796 782

The sacrifice of goats which was an important feature of the festival, was performed in the afternoon of the third day (Yew duh) on the top of an adjacent hill where the *Siem* along with other members of his house, went there in a procession. The people shouted all the time while it was preceeding to that place. The musicians went round the altar first at the top of the hill thrice in anticipation of a happy and good augurs. The Chief priest facing the north, prayed to U Shillong holding a red-coloured cock in his right hand and killed it on the altar collecting its blood in a gourd vessel. The entrails of the cock were carefully examined by him and then kept on a silver plate. The Chief priest threw some grains of rice before him as also over the yellow goat and prayed to U Shillong holding a *dah* in his hand. He then passed on this implement to the *Siem* who also prayed to the deity. The *Siem* handed over the same to a man (nengnong) who sacrificed the goat on behalf of the *Siem*. He collected nine pieces of meat from different parts of the goats body (*e.g.* heart, lungs, liver, stomach, kidney, etc.) and handed them over to the priest. The latter cut each piece of the meat into five parts and offered them to the five ancestors.* The procession returned to the Siem's residence when the head of the goat was brought back by a member of a Kharbamen clan. It was then given to the High-priestess for disposal of the same in a manner as she liked. The day's rituals were completed by performing the goat presentation ceremony in the midnight. The Chief musician stood very near the fire made in this occasion at the verhandah (tynghong) of the building and called the names of different units to present their gifts, in order of their seniority. The gathering that was watching from the courtyard shouted in their traditional way three times on receipt of the *Siem's* acceptance and the animals were led to the *Lymme-Nong* for overnight stay before which they were not considered fit to be sacrificed to be held on the day next.

On the evening of the fourth day (Lyngka) betel leaves and nuts were presented to the members of the *Siem's* family by the people wishing them happiness and prosperity. The chief priest took his seat in front of the verhandah in a line along with his ten assistants who were on either side in a group of five facing the north. The Chief priest worshipped U Blei Shillong and Ka Blei-Long Siem and the responsibility of invoking each ancestor or ancestress was devolved on each assistant priest : [769] [793]

Smit

796 The goats were sacrificed by his sister's eldest son (*Siem-khynnah*) and in
182 charge of respective units at the open courtyard. The priests evoked the
ancestors and ancestress and called upon them by name praying 'Oh God and
769 Goddess, I offer this sacrifice as our ancestors did. Bless the *Siem*, his family
and the people of his state. I shall beseech you again on this day after one
231 year. You create favourable weather by virtue of your power, bring clouds
and rains to yield bumper crops and ensure a happy and prosperous life.'

On the last day (Nongkrem), a man of Mawroh clan sacrificed a pig introducing an iron spike in its left armpit. Nine pieces of meat from different parts of the pig's body were again offered to their five ancestors. The *Siem* in the presence of his *Darbar* performed the last item of festival by praying to U Shillong, when the Chief of Ryngjah clan also followed in the same way for seeking the blessings of their Chief deity.

This brought the ritual to an end performed at the residence of *Siem*. The five pieces of goat's and pig's meat offered to their five ancestors, were then handed over to the in-charge of the five units considered as somewhat higher in their State organisation. They distributed them at a suitable place in their unit, making a feast as a sort of public declaration of the completion of their greatest festival for the year.

DANCING

535 Besides the ritual described above, dance with the accompaniment of music
796 formed an important aspect of this festival. A dance known as *and-ryngkah*
had been a regular feature for the first, second, third and fifth day. This dance
[533] has some interesting features. It has to be performed in pairs. The first
pair was constituted by Chief priest and the Chief musician. Second to fifth pair was left between the Seniors of the right units after which *Siem* along with an official of his council constituted the sixth pair. The subsequent pairs were formed by any two persons from the gathering. They danced only after bowing first before the Oak pillar (*Rinbah*), then to *Siem* on the fifth day. This pairing was then not adhered to on completion of the last rite of the festival.

A solo type of dance (*ka nad mantieh*) was then performed in the courtyard by the musicians as well as by the professional dancers (*nongshad*) with drums and *dy-kroch* in the afternoon of the third day. The dance was always
[291] held in pairs first by musicians, and then dancers, who danced their traditional
[301] dress consisting of silk turban (*Iaimpong*) decorated with feathers, coloured sleeveless coat (*Iymphong*) silver chains and coral necklaces. Later on they joined the procession, that went to the adjacent hill where after the completion of the ceremony of goat killing, a group dance was performed returning to the residence of *Siem* ultimately.

This dance (*nad-mukjor*) was performed by the Siems family. It was held early in the morning of the fourth day in the central hall (*Shlur*) and also
[291] in the courtyard. The men put on their normal dress whereas the women
[301] dressed themselves with gold and silver crown (*passejat*), numerous silver ornaments and different coloured blouse. They dressed and braided the hairs into a knot just at the nape. The High Priestess who also danced with
[302] the members of the Siems' family, stood in the middle of the line and chief musician stood at one end. They hold each other in hand and danced round the fire-place of the central hall (*Shlur*) in anti-clock-wise direction in accompaniment of music. The people assembled there, gave vent to their feeling in their customary way every time, before they resumed to make it three times. Similar performance of dances were also held in the courtyard.

17: Bancrjee E-5 (1955) 1962 AR7 Khasi AR7
Smit

Then followed the dance of the girls (*Ki shad k yeiksi*) who were also wearing dress as described above. They kept their eyes down, keeping their arms on their sides taking such a short steps with the music, that the movement of the feet were hardly perceptable. The boys were also in their dancing dress as worn by *nongshad* and danced with fly-brush round the girls making their steps with the beatings of the drums. The music started from the morning would be stopped only after completion of the dance which prolonged till evening. These functions served as a good source of amusement to the people, enabling them to have a good diversion from their monotonous life with an opportunity to meet their friends and relations who assembled there from different parts of the hill.

535 (534)

DISCUSSION

From the fore-going description, it is evident that the Khasi live in a democratic set up in which the secular duties are entrusted to the *Siem*. A different rule is followed in the case of religious festivals. Every Khasi family entrusts the sacredotal work of the house to the youngest daughter. The *Siem's* sister (Siem Sod) being the senior member of his mother's clan, is made responsible for the observance of these ceremonies which concerns the welfare of the subjects. The people attend the festival to seek blessings of their supreme deity U Shillong and their presence in the Siem's residence indicates their loyalty to him. The rituals of the festival, instead of being performed by her (High Priestess), were conducted by the Chief Priest (Sob blei) for which he was allotted a very important position in the celebration. The musicians were given similar status owing to the belief in the sacredness of their music. It ought to be played in proper tunes otherwise the displeasure of the deity would fall on them on finding any slight departure in this respect. For this reason, the music is considered as important as the rituals and the role of musicians were consequently given due recognition at every stage of the festival. The tradition of depositing one pounce of Nongrong (bin to sacrifice the goat at the top of the hill was followed on account of their ancestors having carried out in olden times the profession of *sala-lawang* (body guard) to the *Siem*. Another pounce of khadhumsa (bin was also asked to carry the head of the sacrificial animal from the hill to the residence of the *Siem* after the worship, as his predecessors were *gatik* in ancient times during the period of their exploits in the Mara. Such evidence were found expressed in a symbolic way through their ceremonies.

182 64 796 (593) 182

The most important concern of the people was to maintain their wish of living together with their property and other means of subsistence. They worshipped him so that he might prevent the evil spirit from doing any harm and may in addition grant them bumper crops. To be recipient of such a favour, they approached their God U Shillong with gifts and prayers. It is not easy whether he is considered as one of their defined ancestors but his important position in the Khasi pantheon enabled him to have some priority in their worship. The offering of and-ewek together with a yellow goat, moreover, revealed his amiable and benevolent nature as the malignant even got appreciation invariably with black colours. U Shillong was invoked simultaneously with other dead ancestors, with this hope, that all the deities would pool their supernatural strength in fighting the evil spirits before the latter were able to move any harm to their crops or to subsist in any way the fertility of their fields.

182 796 769 182 776 182

It would be interesting to refer here about the preservation of nine pieces of meat from various parts of the sacrificial animal. It may be a case of appeasement by serving him with some food but there seems to be something

17: Banerjee E-4 (1955) 19nd AR7 Khasi AR7
Scott

796 magical in such gifts. The Khasi deities being souls of departed members,
782 are anthropomorphic in nature, have all the qualities of an ordinary human
769 being. The worshippers believe that the deities may also loose their strength
776 in course of time which can be augmented only by offering suitable sacrifices.
182 They presented pieces of meat to transfer to them the supernatural "power" which are concentrated or lodged in those regions of the sacrificial animal, from where they were taken out. It is a case of reciprocal help between the deity and the devotee so that on attaining their normal strength, they would fulfil their request.

796 The Khasi people while participating in the celebration gave vent to their
769 emotion through their traditional cries. It could not be definitely established
182 whether these were any indication of frightening the evil spirits but on the other hand, those were intended to cheer the *Siem*, musicians, and the respective units taking parts in the celebration. The musicians on another occasion, were round the altar three times on reaching the top of the hill. The members of the *Siem's* house similarly performed a sacred dance round the
(699) (801) fire place of central hall (*Shiar*) to the same number of times. This odd number of three seemed to be an auspicious one. The exact cause for such a reverential attitude to this figure may be to pay respect to their primal ancestress (Ka Iawbei), her husband (U Thawlang) and her brother, *i.e.*, first maternal uncle (U Suidna) who are considered highest amongst all the Khasi deities.

796 The dancing is generally taken as secular part of religious function, but the
535 Khasi people considered them (except the last one) as sacred for the reason
182 that it is one of their methods of propitiating their deity. The people at times, ascribe certain meanings to them to rationalise their thinking. The dancing invariably put the participants into ecstacy to enable them to be in communion with their supernatural beings, yet these are interpreted as a device to control the spirits inspite of its calm and quiet nature. The people even then enjoyed them with this hope that these would prevent the intruding spirits from spreading diseases. Owing to the fixation of the dates of the function at the time of sowing period, the dance of the unmarried girls may have some bearing on the promotion of fertility of the soil. The custom of allowing Khasi boys to dance round the spinsters with fly-flap in one of their hands may be to protect them from the influence of the evil spirits.

The heads of the various units adhered to the official precedence strictly before they allowed a common man to take part in the dancing. The custom of allowing two officials to dance, at a time, was in recognition to their equal status. It had become a practice to follow at every stage of their function. The presence of all the incharge of the Siemship were essential to secure the blessings of their deity on behalf of his subjects whom they represent in official capacity in the festival. This is a suitable mechanism to foster unity and solidarity among the people of the different units which is the main aim of this celebration. This was found to be so when Khasi people from all parts of State were seen witnessing the dancing of the unmarried girls. The informant on being asked to state the reason of permitting the spinsters only in this dance, came out with an interesting fact about the ancient Khasi tradition. The dance used to offer at one time, an opportunity to the youngmen of the Royal families in selecting their brides. A betel leaf with a nut were usually thrown at a girl and the men going round them, remained as witness of the incident. This explanation received some support from the frequent utterances (*rong-rong*) by the public, expressing a desire to run away with a girl dancing with graceful style.

796 The celebration can be taken up as a solidarity rite. The performance is
182 all the more essential for the purpose of security without which the people

17: Banerjee E-5 (1955) 1962 AR7 Khasi AR7
Smit

could not be in a position to divert their attention to the problems of basic amenities and other necessaries in their life. This is expressed through rituals which are maintained through tradition and transmitted from generation to generation. A proper performance of the ritual ensures prosperity. 796 182

The maternal uncle occupies a very important position in the social life of the Khasi community. He acts as a manager of the family and his opinion is always sought for in any matter of social implications. He is thus honoured and respected by all the members of the house. In spite of the matrilineal set up of their society, the men are given honourable position in the affairs of the family. Their role has been given due recognition in their various customs and rites. The uncle (mother's brother) as also husbands in some exceptional cases, are always remembered by the living members of the house for their wisdom and sagacity. They are thus deified and are prayed by them to bestow all possible help to tide over their period of crisis. The Khasi pantheons to whom the people in general pay due reverence, are considered to have led similar life as prevalent in their present society. Thus the various rites and ceremonies that are observed, expressing clearly the duties, nature and obligations for these deities, are simply a reflection of the Khasi way of life. The general pattern of social structure has been found to be projected unconsciously through their religious worship and these celebrations are of course of great value to the local inhabitants as it re-informs certain cultural features so characteristic of the tribe. 593 604 182 769 796 182

Previous Views on the Khasi Group. Monograph of the Khasi Hills, Tavoys. By Major H. H. Godwin-Austen, F.R.G.S., F.Z.S., &c., Deputy Superintendent Topographical Survey of India. [With Plates ii. and iii.] 800

Having again visited the Khasi Hills since writing my last paper, I am enabled to give some further details regarding their 19 21

only stone monuments. At the village of Nongbah, near Shillong, we to be seen some very striking monoliths; and although they do not come up quite to the length of those at Nongtalang (noticed by Dr. Hooker in his "Himalayan Journals"), yet they are very worthy of being mentioned. They stand on the open spur just above the village, and have been worked out of the beds of the Shillong sandstone series, and some of the smaller blocks have been taken from the conglomerate beds, the lowest in the series and which crop in, in the bed of the nullah, to the south of the spur. There are a number of monuments on this site, large and small, arranged both in line and on two sides of a square; the two largest have their central monoliths—height, 21 ft. 7 in.; width, 4 ft. 6 in.; thickness, 7 in.; and height, 21 ft. 4 in.; width, 3 ft. 7 in.; thickness, 1 ft., respectively.

There is, which is taken from a photograph by Mr. William Roberts, Assistant Surveyor in the Khasi Hills survey party, gives an excellent idea of the second largest structure, showing the very massive lakatoor, the "Kiad Kyrkat," in front. This structure consisted of thirteen upright stones, which could not all be brought into the field of the camera; but the six outside stones on the right are shown. Many of the slabs in the adjacent monuments have been overthrown and broken quite recently, perhaps by Sepoys and camp followers from the military station close by. At one time a mountain battery of European Artillery was quartered there, and I attribute the overthrow of so many of the stones in the neighbourhood to their handiwork, who would look on such monuments as a "great lark." The Sepoy (native of India) is not of a very mischievous disposition; the European and half-European (non-commissioned) is decidedly so. Thus the monument with the highest stone is impossible, and it must, when perfect, have been a very handsome one. This is a sad pity, after the time and labour that must have been expended in its erection.

I did not discover any new slabs anywhere in the immediate vicinity, possibly "Nongpoh" is merely an absolutely very strong position, and old lines of fortification are to be traced on many sides, especially on the approach from the direction of the Falls of the Umiam. These old lines of defence are on a curious system; a ditch and bank have been carried forward from the main defences from 200 to 300 yards down the ridge of the spur, thus effectually preventing an enemy working round the hill side below the village.

This fortified site points to a state of things in these hills when the relations between the large village communities or

19: Godwin-Austen C-3 (ca. 1972) 1975 AR?
Khasi AR?

194
212
629
[78]

slave were very much so as to find them at the present day among the Naga and Kukis, beyond and bordering our present extreme limits, viz. that of constant feud. They are now the quietest, most peaceful, and contented of all the hill people on the eastern frontier.

In my former paper I did not allude to the caves in these hills, which I am inclined to think are works of greater age than the stone structures. The custom is one that certainly has long since been given up, for I could not obtain any satisfactory account of them. They are only to be seen on the northern side of the Khasi plateau, and Dr. Hooker, in his account of his trips to the Kollong Rock, did not fail to notice them. About Barung and towards Jowpitoo they are very numerous, and always stand on commanding situations. On the path leading down the grassy spur to the stone monuments previously described, near Jowpitoo, is a very fine large example of a cave, about eight feet high. They are usually plain hemispherical mounds of earth; but this one is faced all round on the base with slabs of stone about four feet high; they are frequently not higher than six feet. A distant view is shown in Plate iii.

Nowhere in these are trees of the earth that forms them having been excavated close by; it must, therefore, have been carried in some short distance, to avoid unsightly hollows near the structure. I should much like to have dug into one of these caves, but was afraid to hurt the feelings of the people by doing so. They are very probably sincerely of an earlier form in those now made of stone, and this point it might be interesting to clear up.

[72]

[03]

Beyond the Khasi area no caves are to be found, at least I had never come across any until visiting North Manipur last winter (1872–73), where, at the head of the Imphal river, on the direct road from Sonapoorjing, are four fine caves, all faced with large boulders. They are old, and the Naga now living in the village near said they had been made by another clan of Naga, who long ago had gone further north, and the site of which village is to be seen, very similar to ours, in Kohima.

[114]
[181]

[114]

[126]
[164]

[illegible] refers to the different forms of the cemetery in the Khasi Hills; but he has not quite exhausted the subject, or gone further than I did, although with regard to the disposal of the ashes of the dead he gives some further interesting particulars.

As I think that drawings are of very great interest, and better exhibit the many different forms of bone depository or cemetery that have been adopted at different periods by tribes inhabiting localities very far apart, and often quite unconnected ethnically,

10: Godwin-Austen G-3 (c.c. 1872) 1875 AR 7
Sheet AR 7

764
122
025

Later a sketch of a form of cemetery meriting attention, and not hitherto noticed (Plate iii.). Several of this form may be seen on a low spur near the Dome of Jubilee at Shillong. The cemetery is above ground, and stands on a slightly raised platform. It consists of four thick stones, about three feet high, set on edge, and capped with a heavy top-stone; and, so far, it resembles the usual form, a figure of which is given in my first paper.* The approach to all these depositories is from the outward by several low steps, and the whole structure is enclosed on three sides by large flat slabs (in the rough) standing on end—the largest being placed round the cemetery (well overtopping it by three to four feet, and the remainder, three-fourths thereof in size, stand on either side of the steps. There are about six such monuments along the edge of the spur, and I have seen no others similar elsewhere. They have been broken into, and the first stone removed, very probably by some followers from our regimental lines, which is close by. There is thus a double probability of their ultimate destruction altogether, should the entire be extended to that direction.

Discussion.

000

The President said that the paper of Lieut. de Crespigny on the Minyongs of Burma, contained a great deal of extremely interesting information, especially in relation to their religious customs, the author hoping, attempted to connect the Minyongs with the inhabitants of Thibet, through the similarity of their religious beliefs. He (the President) did not venture to express any opinion on the point, but believing any opinion to be worthy, he thought, however, that, as a general rule, evidence of identity of race, derived from the comparison of the religious of savages, must be received with caution, especially in the absence of any information as to physical resemblance. The attention that is devoted to religion arises from the interest that is taken in the subject, rather than from the value of the evidence it affords of connection with other peoples. There must always be a great liability to error in the attempts of the religious customs of savages. Inquiries into the resemblance of the arts of different people, about which there could be no mistake, were, he thought,

of more scientific value; and the conclusions given by the author in this paper will, no doubt, be found of great use to comparative philologists. It is hoped that the Institute would be favoured with some fuller information on the races of Borneo from Lieut. de Crespigny.

With regard to the paper by Major Godwin-Austen, he (the President) must say his communications were always welcome to the Institute. He wished that a more detailed account had been given of the monument referred to. There appears to have been a great camp-building period in the life of most races, when neighbouring tribes are constantly at war, and each had its stronghold in case of attack. Such camps are conspicuous amongst the antiquities of nearly all parts of the world, and a comparison of the different styles of defence adopted, when viewed by the knowledge of the art of communication which we possess, affords reliable evidence of physical connections. In the early British camps of this country head never saw any evidence of the use of flanking defence excepted the entrance; but the description given by Major Austen's this earthwork appeared to indicate that something of the kind was known to these people.

REPORT ON RURAL ECONOMIC SURVEY IN UNITED KHASI-JAINTIA HILLS.

CHAPTER I

Introduction

1.1 **Objective.**—Consequent upon restrictions on trade merging in the border marches after partition, the economic conditions of the people living in the border areas of the United Khasi-Jaintia Hills district adjoining East Pakistan, suffered a serious set back. There was demand from the people all over the border areas for adequate relief as well as rehabilitation of their shattered economy. From time to time Government took up various relief measures but, for adopting a planned programme of relief and rehabilitation in an integrated and sustained manner, the need for a comprehensive economic survey of the district with special emphasis on the border areas, came to the forefront. Accordingly at the instance of Government of Assam, the Department of Economics and Statistics addressed itself to the task of launching an economic survey in the district.

The programme consisted of an intensive study of the conditions in selected villages and was designed to meet the following objectives:— (i) To obtain a broad picture of the rural economic conditions in the district and in particular, to provide factual data on the various aspects of agriculture and farm economics, *e.g.*, land tenure, size and distribution of agricultural holdings and farms, fragmentation, income and expenditure, indebtedness and the like. Data should be collected also on the occupations and industries which play subsidiary roles in the economy of the district. (ii) Special emphasis need be given on border areas, in order to bring to light the measure of suffering of the border people as a result of partition and to suggest various long and short term measures for ameliorating the condition of the border people. (iii) The survey should adequately cover the Community Development areas also in order that it becomes possible to make an assessment of the impact of the community development programmes on the socio-economic life of the people in these areas.

1.2 **Coverage and Period.**—The field work of the survey was started on 23rd February, 1958 and was completed by the middle of July, 1958 thus requiring nearly four and a half months.

1.3 **Design of the Survey.**—For a study of border economy a purposive selection of ten villages in the border area, which were known to be important from the point of view of production and distribution trade in pre-partition days was made. Similarly for Project area a total of eight villages two from each of the four blocks in the district where intensive development programmes were taken up, were selected. These villages were selected by the Project Officers themselves. Apart from these, a random sample of ten villages from all over the district were taken. Thus a total of 28 villages all over district—10 from border area, 8 from project area and 10 from general sample were selected for

12 654 investigation. The sample size of ten villages only out of a total 1887 villages in the general area of the district is indeed, very small, which nevertheless had to be resorted to commensurate with the availability of time and field staff at our disposal and in consideration of the difficulty of conducting field work in the remote interior of a hill state in, where communication facilities lack so badly.

1.6 Plan of Investigation.—Plan of investigation may be considered as consisting of two parts viz.—

(1) The general investigation was confined mainly to six border area. This consisted in holding meeting of villagers in the selected villages, discussing the various important problems facing them and recording their suggestions for improving their lot. Apart from meeting the villagers, problems were also discussed with the important people of the locality.

Schedules—Schedule I.—This schedule was meant for collection of village statistics relating to various facilities offered by the village, namely—communication, health, sanitation, education, marketing, cottage industries and the like.

Schedule II.—This was the most important schedule for collection of information on the economic aspect of the families. This was canvassed in all the families of the selected villages. The most important item on which information were collected through this schedule were :—

Block V: Demographic particulars of household, occupational and employment patterns.

Block VI: Household indebtedness.

Block VII: Land holding and farm.

Block VIII & IX: Implements and Livestock.

Block X & XI: Household expenditure.

Block XII: Receipts and disbursement of the household.

Schedule III—Listing of household and occupation.

Special Schedule.—This was canvassed in all the households of the villages selected from Community Project areas. This was intended to collect information on adoption by households of various improved agricultural practices advocated through the Community Development programme and for assessment of the extent of public participation and co-operation in developmental works. Information was also collected on agricultural extension received by households.

1.5 Method of collection of data and field organisation.—For the collection of data personal interview method was adopted. Actual investigation in the villages was done by Inspectors and Primary Investigators of the Department of Economics and Statistics. The District Statistical Officer was put directly in-charge of the investigation. He maintained general supervision, direction and control of their day-to-day work. The officers in headquarters also exercised overall supervision and inspection. Before starting the actual field work, the Director of Statistics, apart from personally visiting the border area and selecting the villages for investigation in consultation with knowledgeable people of the locality, addressed letters to the District Council for rendering all necessary help who in turn instructed all the Members of the District Council and village Sirdars to extend their co-operation to the field staff. We take the opportunity of recording here our deep appreciation of the valuable help we received from various officials and non-officials in the conduct of the survey.

It is obvious that the success of such a survey under specially difficult situations lived in the inaccessible and backward hilly areas, entirely depends on the intellectual honesty and technical efficiency of the field staff as well as on their ability to call up the required sense of co-operation from all concerned. Though we could reasonably claim a high standard as regards the former category of requirement, the latter nevertheless presented itself as a tremendously difficult task as, the villagers—almost free from any tax or other obligation to the government—could not but receive this work with feelings of suspicion and resented it as a device to buy some taxes or other by the government, in as much as it did involve some questions relating to land, income and expenditure, etc. It was at a large measure of effort to keep the level of suspicion at bay. We had to hold sittings in each village and devote considerable time to convince the people that this was in no way connected with any taxation scheme.

1.6 Interim Report.—In view of the urgency of the border problem, particularly the setting up of Border Rehabilitation Committee for suggesting ways and means for rehabilitation of the border economy, we learned to submit an interim report on border economy to the government on the basis of investigation conducted only in few border villages in April, 1958.

CHAPTER II

General Features of the District

128 2.1 In this chapter a brief note on the geography, population and economy of the district is given in order to provide a perspective and make the report self contained.

129 2.2 Relief.—The whole of the district is composed of hill ranges. On the northern and western border these hills take the form of parallel ranges which run for the most part north and south and have a general height of one to three thousand feet. None of the hills in the central and southern portions of the district has anything really or precipitous about them. Their sides are covered with short grass and from one direction or another, they can generally be accounted by a man on horseback. There is a high plateau in the centre of the district, the general level of which is not much below 6000 feet though it decreases in height towards east and west.

2.3 Rivers.—The high plateau that occupies the centre of the district is the watershed of the hills. The following are the principal rivers. On the west there is the Jaldhaka or Kynshi river, further east come the Um Manda and the Bogapani which fall into the Surma. The Umngot or Mahabhali, known as the Pylon Gang in the plains of Sylhet, forms for a considerable distance the boundary of the Khasi and Jaintia Hills. On the north the principal rivers are Kaichi, the Dhanu and Umiam. Further west comes the Umkhen, Um Myntang and the Myntang. All these rivers possess the characteristics usually associated with hill streams. The beds are rocky and gravelly, the currents swift and after heavy rains even small streams come down in spate. The rivers of the district are not used for traffic to any appreciable extent.

135 2.4 Minerals.—The Geological products of economic value are lime and coal. From the earliest days of British rule, the lime quarries of Khasi Hills formed one of the principal attractions of Sylhet, drawing a large number of Europeans to that district. The lime quarries are situated all along the southern face of the hills. Coal is found both in the cretaceous and nummulitic formations. The largest deposits of nummulitic coal are found at Cherrapunjee, Laitryngew, Mawsynram, Jowai, Sutnga, Mawphlang, Mawsynram, Lalabung and Nongpoh. Cretaceous coal is found in Mookhlikar, Borsora, Wapung Lankyrow and in the Langrin field.

137 2.5 Forests.—The district exhibits a varied flora reflecting the variations in the physical features, configuration of the ground, edaphic factors and climatic gradient. In the pine zone covering area between 3000-4000' elevation are found the pines, birch, alnus, oak, beech, etc. The evergreen hardwood zone, which forms belt along the foothills contains useful hardwood species of which the most important species are sal, sadar, chum, chap, gamari, etc. The dry grass belt covering the lower zones roughly between 500'-2000' elevation from the level ground for grazing.

Until now the main sources of forest revenue in the district are timber, firewood, lac, bay leaf and elephants. 13

2. Agriculture.—The greater proportion of population of the district work on agriculture. The staple crops raised in the district are wet and dry rice, various kinds of millets, maize, potatoes, pineapples, oranges, arecanut, betel-leaf and bay leaf. To a smaller extent they grow in the gardens round their houses vegetables, pulses and occasionally sugarcane. 24

2.1 **The main crops : Rice.**—While wet rice is grown in the valleys with which the hills are intersected, dry rice is grown on the hill sides. Highland rice is seldom grown twice running on the same spot for after one crop the soil is exhausted and a fallow period of four to five years is usually allowed. Jowai subdivision is predominantly a wet rice producing area. In Shillong subdivision main wet rice pockets are the Khoi area stretching upto the sung valley and the northern portion of the plateau, the Mylliem state, the south-western portion of the district and the southern plain portion of the district adjoining East Pakistan. Dry rice is grown more or less through out the district. While Jowai subdivision can claim self sufficiency in rice, Shillong subdivision is a deficit area and the people in this subdivision particularly those in the southern portion (border area) of the district have to depend on supplies from outside. Though there is no reliable statistics of the area under rice, a rough estimate is given elsewhere in the land utilisation table. 243

Maize and millet.—The two important food crops of the district grown more or less throughout the district.

Potatoes are extensively grown in the higher slopes and in the lower land which are well drained. Generally two crops of potatoes are raised annually in the district. In respect of production and export of potato this district occupies the topmost position in the State of Assam. 244

Oranges, betel leaf and arecanut are most extensively grown in the southern base of the hills, *i.e.* all over the border areas. Oranges are also grown in Borsillat areas, in the northern portion of the district. Orange and betelnut plantations extend from the foot of the hills to a height of about 1500 feet and are carried up the ravines which score the southern face of the high plateau. The district is an important producer of Bay-leaf which is abundantly found in the border areas of the district. Other valuable cash crops of the district are black pepper, turmeric, chillies, ginger, pineapple and various other fruits. 245

2.2 **Agricultural seasons.**—For wet rice, the lands which are naturally irrigated by virtue of their very location, are ploughed or hoed by about the middle of February and seed sown in May or June. Harvesting takes place in October and November. For dry rice, the land is hoed by about the middle of September, the solds are collected into little heaps and burnt and by February the land is again hoed up and the seed sown in April - May. Harvesting goes 243

243 on from October to December. For millets the seed is sown in April-May and reaped about six months later. Maize is usually sown in 244 April-May and ripens in August-September. For potato, generally three crops are raised in the district; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

245 For oranges and betelnut the orchards are cleaned of weeds twice a year. Harvesting of orange takes place from October to January. Betelnut ripens at the beginning of the year and are collected between February and May.

241 2.6.3 **Agricultural implements.**—The usual agricultural implements are a hoe, a sickle, three or four kinds of dao, a harrow, a cleaner which is used for the construction of irrigation channels, sieves and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Bhoi area and rotavator the use is in use in the plains of the State.

2. 6. 4. **General cultural practices.**—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

233 2.7 **Cottage Industries.**—Cottage Industries, it appears, have not 326 found very great favour among the people of the district. A few 322 families here and there manufacture iron implements, earthenware, 185 pottery, baskets, mats and jewellery. In striking contrast with other 308 districts weaving of cotton clothes is rare among the Khasis. The 286 Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir 171 Hills practice it only for their domestic consumption. At present, the 654 Government is trying to popularise weaving in the district and this 231 has been welcomed by the Khasis. Among other cottage industries production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

142 2.8 **The People.**—The Khasis and Jaintias are a short sturdy 197 race distinct from the neighbouring hill tribes. By nature they are 44 hardy and laborious and in respect of manual labour, they are free 563 from any inhibition. Side by side with the Khasis live the Mikirs, Garos and Nepalis who form respectively 7.32 percent, 3.38 percent and 7.07 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

241 2.9 **Occupation.**—The greater portion of the population of the 232 district subsists on cultivation. More than 75 percent of the rural 246 households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

[illegible]

and even the well to do even do not feel anything to work as labourers in other's farms. It is almost customary among the agriculturists to work in other's farms on wage basis, when agricultural operations in one's own farm are over. This is probably an outcome of the difficult economic situation. Among the non-agriculturists a few, those who follow agriculture as subsidiary occupation, a large number of persons and labourers engaged in jobs like transporting of goods from place to place, collection of bamboos, wood, fuel etc. Cultivators and farmers of the district also offer employment to a good number of people. Since the taking up of road programme under the plan, a large number of people are getting employment in construction of roads, etc. It is heartening to note that for conservation of roads, use for all kinds of works demanding unskilled labourers, the district fully serves the whole labour force. People in the various local pockets of the district, particularly those living in higher hills are mainly engaged in trade. The tribals are indefatigable traders and hawkers side by side with the whole of the small trade in the district in their own hands. A small proportion of the people are engaged in cottage industries such as mat cutting, brick making, bee keeping, blacksmiths, [illegible] and furniture works, etc.

The number of persons enumerated in the 1951 census under each of the eight main livelihood classes for the rural area of the district was as follows.

TABLE 1

Division of Persons (Census 1951 Census)

Class	Male	Female	Total	P.C.
(1)	(2)	(3)	(4)	(5)
A. Agricultural classes—				
1. Cultivators of land wholly or mainly owned and their dependants	[illegible]	[illegible]	[illegible]	[illegible]
2. Cultivators of land wholly or mainly unowned and their dependants	[illegible]	[illegible]	[illegible]	[illegible]
3. Cultivating labourers and their dependants	[illegible]	[illegible]	[illegible]	[illegible]
4. Non-cultivating owners of land, agricultural rent receivers and their dependants	[illegible]	[illegible]	[illegible]	[illegible]
Sub-total	[illegible]	[illegible]	[illegible]	[illegible]
B. Non-agricultural classes—				
1. Production other than cultivation	[illegible]	[illegible]	[illegible]	[illegible]
2. Commerce	[illegible]	[illegible]	[illegible]	[illegible]
3. Transport	[illegible]	[illegible]	[illegible]	[illegible]
4. Other services and miscellaneous sources	[illegible]	[illegible]	[illegible]	[illegible]
Sub-total	[illegible]	[illegible]	[illegible]	[illegible]
Total	...	...	[illegible]	[illegible]

[illegible] 3.11 **Labour and Wages.** It has already been mentioned above that a large number of people subsist on labour—agricultural as well as non-agricultural. Owners of big orchards employ labourers for clearing of their orchards twice or thrice a year, ploughing and manuring to produce to crop. Fields cultivated with large farms require labourers for ploughing and hoeing of fields, sowing, harvesting and threshing of paddy. It should be mentioned that due to the peculiar agricultural practice prevalent in the district, the input of labour cost for paddy cultivation is higher than that in any of the other districts of the State, which compare unfavourably to the labour cost for small paddy fields. In the case of cash crops, wages are usually paid in cash and for food crops it is paid in cash and kind more usually in kind. Wage rates for males and females are different which generally vary from Rs.0.50 to 1.25 for males and Rs.0.25 to Rs.0.50 for females.

There are however, numerous instances of engaging agricultural labourers at the rate of Rs.0.50 per day. During the busiest months the cultivators farmers advance loans to the poorer section of the people on condition that repayment will have to be made by rendering labour on wage basis at the rate of Rs.0.50 per day in the cultivators farms whenever their services are demanded. Thus whenever their services are demanded the poor people have to work in cultivator's farm even at the cost of ruining their own cultivation.

There are other instances where the labourers are paid less than usual wages. In some villages where there is density of work of the agricultural labourers gather together at some specified place early in the morning. The cultivators farmers go there and through bargaining manage to reg ge the number of hands they want at very low rates. Similar letting down of wages of non-agricultural labourers is also prevalent whenever demand for labour is very low.

Land utilisation and cropping

[illegible] 3.12 **Land census system.**—The district of Dakshin Kanara is not cadastrally surveyed and so far as land census is concerned, there is no road uniform or regular system work the same, with the exception of those lands under the control of the State Forest Department and the Land Tribunal Council. There are different kinds of land under different systems though for obvious reasons no reliable statistics can be gathered in respect of them. As far as land census system is concerned, there subdivisions in completely different from Shiling subdivisions. However, land in the whole district can be broadly placed under the following categories:

[illegible] 1. **Ryotwari or Private land.**—They are private land belonging to certain class or families but not to an individual according to Ryotwari system. Under Ryotwari system the Revenue Council has got any private land there exists the ryotwari patta to work any dispute that may arise [illegible] any piece of land. The only connection is with the Land Revenue Department in respect of private personal lands who collect royalty from the produce of these lands if they are used for purpose of

lands. Rajas are mostly found in the higher hills region—the area [illegible] [illegible] of the district covering the lower and [illegible] constitute a major portion of the total area of land in Hillang subdivision. In Jowai subdivision private lands are very small in area, only 1,[illegible] acres in total and they are known as 'Raing'.

(i) **Raj Lands.**—They are lands belonging to subjects. It can be said to be a common property which everybody has a right to use of course with necessary permission from 'Village Raj' in respect of Raj lands under the village or from Syiem in respect of Raj lands under the Syiem. In case of Raj lands the land continues to be in possession of one as long as he cultivates them, but as soon as he leaves cultivation it reverts back to the Raj. The land which is known in the official work as unclassed State forests is also Raj land but is under the control of the District Council.

Raj lands are found every where in the district though the major portion is found in Khasi area and in his area the purpose of cultivation permission is given to any Khasi from any part of the district, while elsewhere in the district, this is confined to the local people only.

(ii) **Land under Zamindars.**—In War area in both subdivisions here are some big land holders who are locally known as zamindars. There is no record of the number of such zamindars nor the extent of land held by them. These lands provide suitable sites for cultivation of suitable soil, crops like betelnut, oranges, betelleaf, tapioca and other crops. The party landlords are not at all powerful nor it is necessary to enclose the estate. Generally, the landlord leases out of his land as long were taxes and the rest is either land in use or in land and the rate varies according to the fertility of the soil and other convenience from all points of view. On the average the rent per year is 10% of the produce in case of landlord. Rs. [illegible] per acre of land per annum (usually 5 to 6 years) in case of landlord cultivation and for non public cultivation if the land is very fertile the produce is shared in the ratio 50:50 otherwise 1:3 between the landlord and the tenants. For other crops, generally the rent is negligible or nil.

(iii) Surplus lands under the above main three categories there are also lands which are under control and management of the State Forest Department and the District Council of United K.J.H. Hills.

(a) **Forest reserve under Assam Forest Regulation VII, 1891.**—There are forests belonging to Government under the control of the State Forest Department. These are five numbers in total, three of them are in Hillang subdivision covering a total area [illegible] acres and two in Jowai subdivision covering an area of [illegible] acres. The total area is [illegible] acres, i.e., [illegible] sq. miles.

(b) **Forest reserve under executive orders of Government.**—These forest are also under the control of the same Department reserved for the purpose of beautification, etc. There are only five of them within the Hillang subdivision and around the town of Hillang. The total area covered is [illegible] acres only, i.e., about [illegible] sq. miles.

(i) **Green Blocks**.—These green forests are private forest but preserved and managed by the Department for the purpose of ensuring the source of water supply, etc., for the town of Shillong. They are five in number covering a total area of [illegible] sq. miles and located around the town of Shillong itself.

(ii) **Private protected Forests**.—There are private forests protected by the State Government for the growth of forests, but the owner can use them provided permission is given by the Deputy Commissioner. There are 18 numbers of them scattered here and there throughout the whole of Shillong subdivision only and covering an area of more than [illegible] sq. miles.

V. In Jowai subdivision there are four blocks of land covering a total area of [illegible] sq. miles reserved for sports and games. They are under the control of the State Revenue Department.

VI. **Raj lands of unclassed State Protected Forests**.—This includes the Raj lands under the District Council mentioned in item 3 above. These forests were formerly under the control of the State Forest Department but are now transferred to the District Council. They are scattered throughout the whole of the district and cover an area of more than [illegible] sq. miles. There are altogether 32 numbers of such forests, 30 of them with an area of more than [illegible] sq. miles and one in Shillong subdivision and 32 numbers with an area of [illegible] sq. miles are in Jowai subdivision.

[illegible] **Revenue collected by the District Council (Land Revenue System)**.—(a) In Jowai subdivision all the Raj lands mentioned in item 3 above which have been brought under cut partly cultivation are subjected to payment of annual revenue. The revenue is fixed according to the fertility of the soil. There are three classes—class I full lands, class II half lands and class III half lands, and the revenue varies according to these three classes of lands from Rs. [illegible] to Rs. [illegible] per bigha per year. There are altogether [illegible] plots covering a total area of [illegible] acres. No such revenue rates in Shillong subdivision.

(b) In both subdivisions there are also lands under special settlement accompanied by revenue.

Shillong subdivision.—No annual revenue is collected for the building site only from Sutnelyam village, where there are [illegible] buildings covering a total area of [illegible] acres with a total revenue of Rs. [illegible] per year.

Some pieces of land in Sarchar said by the United Fruit Company covering a total area of [illegible] acres. The revenue collected per year is Rs. [illegible]. A revenue of Rs. [illegible] only per year is collected from real building sites at Nongpo-h station whose area is [illegible] sq. ft.

Jowai subdivision.—An area of [illegible] acres of land in Lalmalong and Sangsiar Dolomite and under orange cultivation is also subjected to payment of annual revenue of Rs. [illegible].

There is another 5000 acres of land in Sulaiburma in the hills (Lakhimpur District) which is under the plantation since preparation period. After partition this area has fallen into India. But as generic though its cultivation is still carried on, the revenue has never been collected or it. It shows the company has given to Sulaiburma.

There are also in Jowai subdivision 75 members of building land (ten, mostly based are to non-Khasi individuals and institutions. They include building for churches, schools, hospitals and training classes, etc. The total area covered is 1000.75 acres with a total revenue of Rs.214.6/- per year. The period of the lease varies from ten plus to twenties.

A part from land revenue, all the houses in Jowai subdivision are subjected to taxation. The rate is fixed at Rs.2 to Rs.4 per year according to the economic condition of the village. In Nongpoh subdivision only 21 Rankadipa which were formerly known as British Dominions have to pay house tax.

2.10 **Land Utilisation.**—The following table gives the area under important crops.

TABLE 2

Kharif rice					8,000	acres.
Maize					6,000	"
Chief cereals					1,000	"
Pulses					10,000	"
Chillies					500	"
Sweet potato					5,000	"
Linseed					100	"
Cotton					50	"
Tobacco					400	"
Arecanut					10,000	"
Orange					20,000	"
Jackfruit					10,000	
		Total			1,10,000	acres.

CHAPTER III

The Border Area

3.1 **Definition of Border Area.**—The term 'border area' although very frequently used does not refer to any well demarcated area. It was, therefore, decided after a joint discussion between the Director of Statistics with the Deputy Commissioner of the district and Subdivisional Officer, Jowai, that area within 20 miles of the India-Pak border line would be considered as the 'border area' for the purpose of the present survey. The list of the villages falling in the area was supplied by the Deputy Commissioner and the Subdivisional Officer.

3.2 **Conditions of the Border Area before partition.**—The border area under review thus comprised of the southern slopes of the Khasi and Jaintia Hills and a narrow strip of plains adjoining the southern slopes running along the Pakistan border. The area extends between only over a length of about 120 miles, roughly from Mahadeb on the east to Sonapur on the west thus covering an area of 2,800 sq. miles approximately, comprising of 600 villages inhabited by population of 70 thousands.

3.3 During the harvest and early rainy plantations the slopes are utilized for the production of valuable cash crops on massive scale. These slopes provide suitable soil and climate for the production crops like arecanut, singpha, betelnut, oranges, pineapples and other fruits. On account of rich profits which such plantations give to the cultivators these slopes were more densely inhabited and intensively cultivated than would appear possible from the topography of the area. Even the most inaccessible spots in the slopes has been converted into rich orchards, otherwise the produce was carried by headloads over steep gradients for several miles. Due to steep gradients little other use, except some farming here and there, could be made of this area.

3.4 Because of the very topography, this land had no natural connection with Sylhet district now forming part of East Pakistan. From man immemorial the area had a flourishing trade with Sylhet district. It was a venous trade. The cash crops found super known in the markets of Sylhet, from where in turn the people in the border area obtained supplies of rice, fish, vegetables and other necessities of daily life. This in generation days that enjoyed a very prosperous and also that economy. The cash heritage in the border area villages which are now forming area, bear eloquent testimony to the past prosperous of the border economy.

3.5 With the partition of the country in 1947, trade with the plains of Sylhet, now forming part of East Pakistan, was removed. As a result the whole economy of this region was completely disrupted and the commerce which was flourished with activity and abundance was overshadowed with sorrow, poverty and despair. All the cash crop marketing of the border people for the market in East Pakistan area. For want of communication facilities the produce could not be

transported to other parts of Indian Union. The prices of some of the food crops recorded a disproportionate fall as mentioned below. The price of orange which ruled at Rs. [illegible] to Rs. [illegible] per lot [illegible] fell down to Rs. [illegible] to Rs. [illegible] per lot, that of local rice which used to sell at Rs. [illegible] to Rs. [illegible] per lot [illegible] fell down to Rs. [illegible] to Rs. [illegible] per lot. Tomato and other fruits also suffered equally. The sense of all was that even at this rock bottom price the produce was not lifted. The following figures quoted from the representation submitted to the Prime Minister by the Border Peoples Association which are claimed to have been collected from individual growers are indicative of the extent to which the border traders suffered after partition.

TABLE 6.1

Amount exported from United Khasi & Jaintia Hills to Eastern Bengal before and after partition

(In thousand rupees)

Items	Pre-partition exports	Post-partition exports				
	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
1. Oranges	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. Pineapples	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3. Tangerine	[illegible]	[illegible]				
4. Vegetables	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
5. Arecanuts	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
6. Betel	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
7. Betelleaves	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
8. Bamboo, cane, timber, etc.		[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
9. Spices, turmeric, chillies, pepper	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
10. Fruits, flowers, plants, pine-apples, jackfruits, peels and grapes	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
11. Lemons	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

The difficulty of getting adequate supply of foodgrains and other commodities of daily life posed a serious problem. Due to communication difficulties arrangements for adequate supply of rice commodities from other parts of Indian Union could not be made. The supply from

[illegible] East Pakistan to which the people in the border area were entitled in the strength of various trade agreements of the Government of India with the authorities in Pakistan, were also scanty. The situation was still more aggravated due to the stringent measures adopted by authorities in Pakistan, on the plea of prevention of smuggling, in Dhaka, Bhiy where the entire border trade actually came to a standstill.

[illegible] This stress in border economy has resulted in widespread unemployment among the border people. There being no market for the product, the owners ceased to take proper care of their orchards and plantations. As a result thousands of labourers who were employed in the orchards were thrown out of employment. Similar was the condition of those who were employed in the transportation of various commodities such as merchandise of trade etc. A large section of the people engaged in collection of firewood were also rendered unemployed with the set back received by the trade in timber with East Pakistan. Due to stoppage of cross-border trade, petty traders engaged in distributive trade also suffered.

[illegible] Many of the border people possessing paddy lands and orchards in areas that are located in Pakistan had to abandon them. The following table will show the amount of land lying in Pakistan belonging to the farmer in the selected villages of border area :—

TABLE A-3

Name of village	Area of land lost through partition		
	No. of families who possessed land in Pakistan	Area (acres)	Average per family (acres)
1. Chungri	[illegible]	[illegible]	[illegible]
2. Ghoda	[illegible]	[illegible]	[illegible]
3. Shalgaon	[illegible]	[illegible]	[illegible]
4. Dalu	[illegible]	[illegible]	[illegible]
5. Mandar	[illegible]	—	—
6. Lungkor	[illegible]	[illegible]	[illegible]
7. Dawng	[illegible]	[illegible]	[illegible]
8. Kuchi	[illegible]	[illegible]	[illegible]
9. Amti	[illegible]	[illegible]	[illegible]
10. Gorkawng	[illegible]	—	—

[illegible] A few families who did not have any landed income on this side of the border were reported to have migrated to Pakistan. Most of the families are even now paying tax to East Pakistan authorities even though they are not getting any income because they do not want to lose their right on land.

13 **Measures so far taken.**—Since 1947, there has been constant 649
demand from border people for relief and rehabilitation. Government 659
undertook various measures to alleviate their difficulties. Government's
attention to border problem has however, not been adequate. The
common feeling of border people was that whenever the border problem
deteriorated due to some adverse measures adopted by East Pakistan
authorities more attention was attracted, on the other hand, when
the situation eased comparatively the Government's vigilance also
slackened.

The various measures so far adopted by Government in border area,
have been fully discussed and commented upon by the Border
Rehabilitation Committee. These need no repetition here. But a few
points emerging from the measures put forward by the villagers during
our investigation are noted below.

On the question of the scheme linked up with the issue of 178
diversification of agriculture in border area, a large section of the border 241
people skilled in the maintenance and operation of orchards are opposed 633
to the idea of a complete switch over from cash crops to food crops in
the cultivation of which they have no adequate experience. Moreover,
there is the problem of getting adequate land in the vicinity for use
paddy cultivation. Indeed, having lost the market for some of the cash
crops, some cultivators are trying to increase cultivation of paddy and
other suitable crops on their own initiative whenever suitable
land is available. But the problem of getting adequate funds for
reclamation and improvement of land has proved a serious handicap to
them. Financial assistance to the needy and willing cultivators for
reclamation works and taking up of more minor irrigation projects is
very necessary.

As regards Government loans granted to cultivators, people 241
complained that apart from being inadequate they are often untimely. 651
As a result the people, needy as they are, utilize the amount for meeting 659
their day to day consumption expenses.

There have been complaints that various improved seeds supplied
by Government are of very inferior quality leading to waste of time and
money of the poor people. The Department of Agriculture should not
only check the quality of the seeds before issue but should also see that
the seed are properly used by inexperienced cultivators who are newly
taking up cultivation of these crops.

With the opening up of a few vital B. W. D. Roads transport of 487
border products to Shillong and other places has greatly been facilitated 491
but the problem of transporting from farm remote interior to the various 659
local points on B. W. D. roads still remains unsolved. While during
some years these places may be negotiated by a mule on foot up and
down the steep gradients, during rainy season these roads become
slippery, the streams and circlets are non-fordable and it becomes
impossible for a mule to cross them, thus isolating the villages from each
other leading to scarcity of roads and all other activities between villages.
Properly planned rural relief schemes for construction of feeder roads and
bridges linking up these villages will, apart from giving some works to
the people alleviate much of the difficulties of transportation of
agricultural produce.

485 Regarding supply of foodgrains through fair price shops, the position appeared to be unsatisfactory. Complaints were heard from some 687 villagers coming from the interior villages that they were rarely get rice from fair price shops, which are usually allotted to bigger villages, sometimes too far from the villages vagged to it. Even the people of the villages where there were fair price shops, complained that the supply of rice to these shops was inadequate and the price also was very high which in some cases was even as high as Rs. 0/00 per maund.

486 In a majority of the villages investigated, water supply and medical 514 facilities were not satisfactory. Malaria, dysentery and other bowel diseases are common in the area.

CHAPTER IV

Report of the survey

4.1 Distribution of sample [illegible] has already been mentioned in Chapter 2 that purposive selection of ten villages from Bauchi area, eight villages from the Jungle Area and 6 Random selection of ten villages from the general area, were made for intensive investigation.

It is not our intention in this Chapter on the specific needs of individual villages. Some common salient features of the villages relating to the situation of the villages, disease-spreading flies and mosquitoes, communications, educational and medical facilities obtainable in these villages are briefly described below for the purpose of giving [illegible] the condition of the sample villages.

The following table shows the geographic distribution of the sample villages, their location by chiefs and subdivisions and the number of families inhabiting each village at the time of the survey.

TABLE 4-1

Sample villages in United N. A. J. Hills and their location

Group	Name of village	Chiefs	Subdivisions	No. of families
(1)	(2)	(3)	(4)	(5)
[illegible]	1. [illegible]	[illegible]	[illegible]	[illegible]
	2. [illegible]	[illegible]	[illegible]	[illegible]
	3. [illegible]	[illegible]	[illegible]	[illegible]
	4. [illegible]	[illegible]	[illegible]	[illegible]

	26. Kedi	Do	Do	5
	27. Jiwi	Khaiganh	Do	7
	28. Kychah	Do	Do	23
		Total --		1,037

7.1 4.3 General collection. — The villages are free from severe natural calamities like flood, erosion, earthquake and the like. Excessive rain fall has reached the higher levels below near Chemenyim, Mawemenyim, etc. During the monsoon also heavy rain, the small streams and creeks rise to spate delaying communication from village to village which cause much inconvenience to the people in carrying on trade, marketing and other day to day activities.

6.3 Incidence of diseases and medical facilities:

TABLE B-2

Incidence of diseases

Name of disease	No. of villages reporting incidence of disease		
	Border area	Plains area	General area
(1)	(2)	(3)	(4)
(a) Malaria	0	0	0
(b) Dysentery	0	7	0
(c) Pox	7	7	4
(d) Kala-azar	1	0	0
(e) Leprosy	0	1	0
(f) Typhoid	1	0	0
(g) Pneumonia	0	0	0

N.B.—Number of villages surveyed—10 in border area, 8 in Plains area and 10 in General area.

As the above table shows malaria and dysentery were of common occurrence. The scourge of malaria was, however, reported to be more acute in the border area, the hill slopes of which provided suitable breeding ground for mosquitoes. Due to malaria, dysentery and other bowel diseases have widespread prevalence in the district. The high incidence of these as well as various skin diseases are mainly accounted for by a lack of good water supply. Leprosy and kala-azar were reported only from one village each (Jyrkah and Shella respectively).

TABLE B-3

Distribution of the villages according to distances from nearest dispensary, hospital, veterinary dispensary and nearest private licensed medical practitioner

	Within the village	Within 5 miles	Within 5 miles	Within 10 miles	Within 20 miles	Above 20 miles
Dispensary	1	1	2	7	0	0
Hospital	0	0	0	1	0	10
Veterinary dispensary	0	0	0	1	0	10
Private licensed medical practitioner	0	0	0	0	0	0

[illegible]

The table above clearly shows that the medical facilities available to these villages are far from satisfactory. Only 6 villages out of 68 villages have a dispensary either located in the village or within a radius of few miles. Considering the lack of communication facilities and the hilly nature of the district even five miles is often too long a distance for a patient to go to the doctor or for a doctor to attend a patient. When the doctor has to move long distances the charges become too high. As a result the poor patients in case of serious illness have to approach unqualified medical men when one is available or otherwise to depend upon the mercy of God. Even for quinine and other cheap medicines one has to go to a dispensary or a private medical practitioner miles away. Especially the most disheartening fact is that the medical help provided by the people from Government dispensaries are not often timely and adequate due to non-availability of a doctor and inadequacy of stock of medicines.

[illegible] 1.8 **Sanitation.**—Though conditions of housing, sanitation, etc., of the villages are described in village notes in the appendix, it will be perhaps to make some general observations on the point. Unlike other hill tribes, the Khasis usually their house sites on the hill slopes and level lands by the side of the hills as a protection from winds. From the fact that the villages are situated in the slopes one might be tempted to think that the sanitary and drainage system of the villages should be quite satisfactory. But in fact it is otherwise in many cases particularly in the case of big villages where too many families huddle up constructing their houses very close to each other thus practically converting the village into a slum. Many of the villages, due to their very location in green surrounded by thick jungle do not get sufficient sunlight and as a result always remain damp, facilitating frequent incidence of cold and influenza. People remove the cut of nature in jungle and bushes in and around the villages. Many of the villages are built on level lands full of swamps, and soil full weeds, pools which provide good breeding place for mosquitoes. Cowsheds and pig sties are built close to the residential quarters which make the villages all the more dirty. Indeed, there are villages enjoying excellent sanitation and health but in majority of the villages there remains a lot to be done for improving the sanitary, drainage system, for educating the people to make their villages more hygienic. From the Government side also, elaborate measures should be adopted to combat and eradicate malaria which is still causing havoc in the district. Similarly, drinking water supply schemes should receive a high priority in a programme of development.

[illegible] 1.9 **Housing.**—Majority of the houses in the interior areas are made of thatch and bamboo with wooden planking or stone or earthen floor. Walls are plastered with mud. In higher altitudes houses are fairly roofed generally as a protection against wind and heavy rain. Some of these houses seem the shape of a half-turned saucer. They generally have [illegible] opening through the main door, though some of them have another in their rear side. They generally contain only one small room. One who is not used to such unclean surroundings from the outside, especially when there are lots of them, could feel uncomfortable. Houses of the well-to-do people particularly those on the road side, are built in the modern style with C.I. roofing, stone floor, and plastered, whitewashed

or timber or mud wall with plinth of stone and windows. Houses of most of the hamlet villages were well connected also agricultural facilities, but are now in tottering condition for want of proper repair and maintenance.

4.4 Educational Facilities.—The following table shows the number of educational facilities enjoyed by the villages under enquiry.

TABLE B-4

Distance within a radius of 2 miles	No. of villages having the nearest school				
	L. P.	M. S.	H. S.	Basic	Vocational school
(1)	(2)	(3)	(4)	(5)	(6)
0	10	0	0	0	0
1	0	1	0	0	0
2	0	0	0	0	0
3	0	0	0	0	0
4	0	0	0	0	0
5 and above	0	0	0	0	10

The above table reveals that out of a total of 10 villages, 10 villages have got a Lower Primary school located within the village, 1 have got within a radius of 1 miles and 8 within a radius of 5 miles. Out of the 10 villages under general area selected at random from the district, only 8 villages have got a Lower Primary school within the village, and 2 villages within 5 miles of the village. In regard of secondary education the position is far from being satisfactory as the above table will reveal.

The number of pupils on the roll of the 8 Lower Primary and Basic schools located in the 10 villages was 1,110. Thus the average number of pupils on roll per village was 56 while the average number of females per village was 22. The poverty of the villagers is the main reason for this low enrolment. Many parents would rather like their children to do gainfully work or play about on the fields, than to allow them to indulge in the comparatively expensive of going to school.

4.5 Communication Facilities.—As there are no railways, area [illegible] available roads within the villages, the only communication facilities available to the people of the district is by road. Some of these roads are adequately metalled while other roads having very poor condition throughout the year.

[illegible]

[illegible] The following table summarizes the situation of the sample villages, schools, communational facilities available.

TABLE [illegible]

Villages classified according to distance from the tehsil/national headquarters and from the nearest metalled road.

Distance from	0 miles	1 mile	2 miles	3 miles	4 miles	5 miles	6 miles or more	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
Tehsil/national headquarters	—	1	—	1	[illegible]	20	6	28
Nearest metalled road	4	6	7	9	[illegible]	7	—	30

TABLE [illegible]

Villages classified according to type of road connecting the nearest metalled road and means of transport available

Means of transport	No. of villages							
	Type of road connecting the nearest metalled road						Just on the metalled road	Total
	Fair weather road			Fair weather road				
	Kutcha road	Pucca road	Total	Kutcha road	Pucca road	Total		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
Trucks	—	—	—	—	—	—	—	—
Bus	—	—	—	—	—	—	—	—
Jeep	—	—	—	—	—	—	3	3
Cars	—	—	—	—	—	—	—	—
Carts	—	—	8	[illegible]	[illegible]	—	3	[illegible]
Camels	—	—	—	—	3	—	—	3
Total	—			[illegible]	[illegible]	—	[illegible]	[illegible]

There is no rail-head nearer to the only means of transport of goods in [illegible] villages, and at the rate of [illegible] villages served by the nearest.

28

6.1 **Marketing**.—The Khasis and Jaintias are market minded people. Rarely they sell their produce on the farm site. They have established markets at all average points of the dawan to which they carry their produce for bartering or sale. The market days is a gathering to see a section of people with bandbands owing to the market up and down hills from sales event.

Markets are held usually twice in every eight days of which one is a 'Lumbaiar' day which is held on every eighth day and the other is a 'Chung Sawar' day which is held two days ahead of the Lumbaiar day. The following table shows the marketing facilities available to the rural people in the sample villages.

Table D.7 below shows the number of markets classified according to distances from the selected villages served by them and charge per annum for conveyance of produces from the village to these markets.

TABLE D.7

Average per annum from village to market	Distance from village to market: 1 mile	Less than 1 mile	1—10 miles	Above 10 miles	Total
(1)	(2)	(3)	(4)	(5)	(6)
Rs. Rs.					
0-00 to 100	∞	0	∞	∞	0
0.00 to 0-00	∞	∞	0	∞	0
0.00 to 0-00	∞	0	0	∞	0
0-00 to 0-00	∞	0	0	0	∞	0
0-00 to 0-00	∞	∞	0	0	∞	0
0-00 to 0-00	∞	∞	0	0	0	0
0-00 to 0-00	∞	∞	0	∞	0	0
0-00 to 0-00	∞	∞	∞	∞	0	0
more than 0-00	∞	∞	∞	∞	0	0
Total	0	0	0	0	0	0

No. of villages served by—

1	market	10
0	markets	0
0	∞	1
0	∞	0

[illegible] The above table shows clearly that the producers have to pay heavy charges when carrying their produce which because inevitably [illegible] when the distance to market is very long on the way to the market [illegible] Although no [illegible]. The table also shows that out of a total of [illegible] markets with which the people in the 28 selected villages are in touch, [illegible] are within 10 miles, while 13 are situated more than 10 miles away from the village. Considering the fact that transport is to be done by head of only, marketing of the agricultural produce is indeed a difficult task. The transport charges are far and are high. It is seen from the above table that out of the 27 markets, transport charges in many in 14 markets work out to be higher than Rs. 2 a maund.

[illegible] 4.4 Co-operatives. Twelve co-operative societies were not within the selected villages. Out of these is found as 7 were engaged in marketing or trading. These organisations grew up sometime earlier under direct guidance of Government but mostly at the initiative of the villagers themselves in some certain situations. The following statement shows a list of the co-operative societies in the sample villages.

TABLE 9.4

Name of village	Name of society	Sponsored by
(1)	(2)	(3)
1. Syedbi ...	Marketing Society	Government.
2. Bairong ...	(1) Women Welfare Association.	Local people.
	(2) A Credit Co-operative Association.	
3. Nurbong ...	(1) Trading Co-operative Society.	Do.
	(2) Credit Society for the improvement of the lot of farmers.	
4. Nuki ...	Marketing Society ...	Government
5. Pathanmali ...	The Mulberry Centre Co-operative Society.	Local people
6. Mizoramuah ...	Trading Co-operative Society.	Do.

Name of village (1)	Name of society (2)	Sponsored by (3)
7. Sutrapa ...	(1) Credit Society.	Local people
	(2) Co-operative Trading Society.	
8. Dumang ...	Marketing Society.	Do
9. Stulla ...	Trading Co-operative Society.	Do.

4.10 Cottage Industries.—It has already been mentioned that Village and Cottage Industries are not very popular in the district.

The following table shows the industries reported from the sample villages.—

TABLE 2-9

Industry (1)	No. of villages reporting existence of the industries. (2)	No. of villages reporting production for sale. (3)
Cane and bamboo works ...	9	7
Blacksmithy	5	5
Tailoring	2	2
Handloom	—	—
Weaving and Spinning ...	2	1
Braiding of coconut, etc. ...	1	1
Rearing of lac	1	1
Others	2	1

Blacksmithy and making of baskets, cane products, etc., out of cane and bamboo, are a traditional occupation. Weaving and spinning of cotton, rearing of silk worms and weaving of silk, etc., are in vogue only in the Bhoja area and the areas adjoining Kamrup and North Cachar and Mikir Hills districts. Lac rearing is found in the northern portion of the district, i.e., Nowgaon area.

Except cane and bamboo works and blacksmithy other industries are practised on a very limited scale. There is thus a lot of scope for introducing cottage industries in the district.

241 6.11 **Agriculture.**—The following table summarises a few salient features of agriculture in the selected villages:—

TABLE B-10

Crops raised and agricultural practices prevalent in the selected villages.

Name of village	Important crops raised in the village	Agricultural implements used	Manures used
(1)	(2)	(3)	(4)
Border area.—			
1. Nongkhi	Betelnut, betel-leaf, oranges and paddy.	Daos, hoes, jampers and plough.	No.
2. Amlai ..	Oranges, betelnut and betel-leaf and paddy.	Daos, hoes and plough	Dung
3. Lumkhi-ot	Oranges, paddy and millet ..	Daos and hoes	No.
4. Darrang ..	Betel-leaf, betel-nut	Daos and hoes	No.
5. Mawsoli ..	Tapioca, betelnut, betel-leaf, black pepper and urpata	Daos and hoes	No.
6. Lyngkhat ..	Paddy and urpata	Daos and hoes	No.
7. Shella ..	Betelnut, betel-leaf and orange	Daos and hoes	No.
8. Bala ..	Paddy, millet and tapioca ..	Daos, hoes and plough	No.
9. Nongpo ..	Betelnut, orange	Daos and hoes	No.
10. Bholagunj ..	Potato, betelnut and paddy.	Daos, hoes and plough	No.
Project area.—			
1. Nartiang ..	Paddy and maize	Daos, hoes and plough	No.
2. Wallong ..	Paddy and maize	Daos, hoes and plough	Dung, chemical and bonemeal.
3. Umdon ..	Paddy, maize and millet ..	Daos, plough and hoes	No.
4. Pamarkhawah	Paddy and sweet potato ..	Daos, hoes and plough	Bone-meal, dung, chemical.
5. Madan ..	Paddy and potato	Daos, hoes and plough	Dung
6. Nongpo ..	Paddy, maize and millet ..	Plough, hoes and daos ..	Dung and bone-meal
7. Mawphanlew	Paddy, maize and potato ..	Plough, hoes and daos	Dung
[illegible] ..	Betelnut, betel-leaf, millet and turmeric.	Daos and hoes	No.

General area.—

1. Mawphlang	Paddy and maize	Dao, hoes and plough	Government farm and chemical	241
2. Jaiaw	Paddy, maize and [illegible]	Dao, hoes and plough	No	
3. Mawlai	Paddy, maize, etc.	Dao, hoes and plough	No	
4. Mawlaiong	Paddy, maize and potato	Dao, hoes and plough	No	
5. Aiale	Paddy, maize and millet	Dao, hoes and plough	No	
6. Langrieng	Paddy, maize and millet	Dao, hoes and plough	Dung and [illegible]	
7. Mawkhih	Paddy, potato and maize	Dao, hoes and plough	Occasional	
8. Lapriah	Paddy and maize	Dao, hoes and plough	No.	
9. Dwarya	Paddy, potato and maize	Dao and hoes	No.	
10. Jyngkar	Tezpata, tapioca, millet and orange.	Dao and hoes	No.	

This table reveals that in one region there is bias for cash crops and in the other for food crops—more or less depending upon the soil and topography of the regions. Extreme hardship occurs when there is deficiency in food production or a glut in the market of cash crops. The cash crop producers are, of course, trying to adapt their crops to the changing market conditions. With the loss of market for oranges, the people in the border areas are trying to increase their lentilent production and start cultivating paddy, potatoes, etc. Throughout the district, people are trying to increase wet paddy cultivation. Wherever water is available, they spare no pain to convert it into a wet paddy field. Similarly, increasing interest is evident among the people in the cultivation of valuable crops like black-pepper, cashewnut, etc., which have a good prospect in the border areas. It is felt that there is considerable scope for introduction of cultivation of chillies, turmeric, coffee, etc. But any new endeavour demands heavy initial investment which often is not within the reach of cultivators. Government should continue to advance adequate agricultural loans to the needy cultivators in a better planned manner. 178 241 233 238 64 77

Only 19 out of 28 villages reported use of bullock driven ploughs for wet paddy cultivation. But even in these villages animal power is not universally used. Of course, in the rocky fields people have no alternative to the use of hoes and spades but in some areas particularly in the wet paddy field, bullock driven ploughs may profitably be utilised. It is not that the farmers do not realise the advantage of ploughing but want of funds for purchase of bullocks, etc., is reported to be the cause of continuance of the old practice. Both broadcasting and transplanting methods are in vogue in paddy cultivation the latter being a recent introduction is gaining popularity. Some farmers in the project area villages have tried line sowing but according to them it is very labourious and amounts to 178 241

[illegible] waste of time. Chemical fertilizers are found to be used by some cultivators but there is still a large section of cultivators who feel simply about the use of fertilizers. There is need of continuation of training and demonstration in the proper use of fertilizers and manures.

The primitive method of hand shredding of jute by beating with a stick is used in a waste of time and labour. There is no reason why shredding cannot be done by using hatchets or in the jute farm.

CHAPTER V

Population and Occupation

The following table shows the number of families and population of the sample villages in the different village groups.

TABLE 6.6

	Border area	Project area	General area
1	2	3	4
No. of villages	10	6	10
No. of families	[illegible]	[illegible]	[illegible]
No. of persons	[illegible]	[illegible]	[illegible]
Average no. of families per village	[illegible]	[illegible]	[illegible]
Average no. of persons per village	[illegible]	[illegible]	[illegible]
Average no. of persons per family	[illegible]	[illegible]	[illegible]

The population in the first two groups of villages is much more than in the third group because important villages were intentionally selected from border and project areas. The figures may not truly reflect the difference in the average size of villages in these areas.

The population in the selected villages were compared with the 1951 census figures. But it was found that the two sets of figures are not strictly comparable due to changes in the names and boundaries of the villages and migrations. A note on this study is included in the appendix. [128]

2.2. The following table shows the classification of population by age and sex in the three areas:—

Age and Sex Composition of Population

Age (years)	Border area			Project area			General area		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Below 2 years	[illegible]	[illegible]	[illegible] (10.40)	[illegible]	[illegible]	[illegible] (10.48)	[illegible]	[illegible]	[illegible] (10.76)
2. 2 to below 12 years	[illegible]	[illegible]	[illegible] (30.01)	[illegible]	[illegible]	[illegible] (31.08)	[illegible]	[illegible]	[illegible] (30.40)
3. 12 to below 45 years	[illegible]	[illegible]	[illegible] (57.51)	[illegible]	[illegible]	[illegible] (51.41)	[illegible]	[illegible]	[illegible] (57.18)
4. 45 and above	[illegible]	[illegible]	[illegible] (1.48)	[illegible]	[illegible]	[illegible] (1.13)	[illegible]	[illegible]	[illegible] (1.48)
Total	[illegible]	[illegible]	[illegible] (100.00)	[illegible]	[illegible]	[illegible] (100.00)	[illegible]	[illegible]	[illegible] (100.00)
No. of females per 1,000 males	—	[illegible]	—	—	—	[illegible]	—	—	[illegible]

It is seen that the population under 12 years of age in the border area, project area and general area were respectively 41 per cent, 41 per cent and 41 per cent of the total population in these areas, while that under age group between 12 to 45 years constituted respectively 57 per cent, 57 per cent 57 per cent of the population in the three areas.

It is evident that population of females was as a whole greater than that of male in border area and project area and less in general area. The number of females per 1,000 males in border area, project area and general area were respectively 1,010, 1,072 and 981 against the 1951 census figure of 985 females per 1,000 males in the rural areas of the district of United K.J. Hills.

2.3. The following table shows the classification of population by religion.

TABLE C.1

Classification of Population by Religion

Area	Tribal religion	Christianity	Hinduism	Other religion	Total
(1)	(2)	(3)	(4)	(5)	(6)
1. Border area	[illegible] ([illegible])	[illegible] (39.93)	[illegible] (17.11)	11 (0.41)	[illegible] (100.00)
2. Project area	[illegible] (17.01)	[illegible]	141 (4.70)	0.00	[illegible] (100.00)
3. General area	[illegible] (9.31)	971 (10.10)	33 (2.94)	0.00	[illegible] (100.00)

Population following Hinduism and other religion in the border area comprises mostly of displaced persons from East Pakistan following trade and business as their means of livelihood, while those in the general and project area are mainly the Nepalese who are generally engaged in cattle rearing and agriculture.

1.4 Literacy and Education

TABLE C1-4

Distribution of Population by Standard of Education

(1)		Rural area			Urban area			Combined area		
		Male	Female	Total	Male	Female	Total	Male	Female	Total
			(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)
1. Illiterate	..	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. Literate up to Primary	..	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3. Middle English	..	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
4. Matriculate	..	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	—	—	—
5. Intermediate	..	[illegible]	[illegible]	[illegible]	[illegible]	—	[illegible]	—	—	—
6. Graduate and above	..	[illegible]	—	—	—	—	[illegible]	—	—	—
Total	..	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

[illegible] In Jandia area and project area the percentage of literates is varied [illegible] as 16 and 31 respectively i.e comparatively high figure for a rural area. [illegible] This however, cannot be regarded as a true index of literacy in the rural area of the district for the two that villages from Jandia area and project area were purposely selected almost all of which by virtue of their figures in 1961 and therefore in average active, happened to possess at least one school for quite a long time. The average picture for the district as a whole is brought out by the percentage of literacy in the general area which is only 11. A comparison of this figure with that of 1951 census for the rural area of the district which is only 10 per cent shows that during the last eight years there has been an increase in the percentage of literacy.

As will be seen from table above the proportion of literate among males is higher than that among females throughout the district.

Economic Status

[illegible] 5.5. The following table shows the number of persons in the sample villages by sex and economic status.

TABLE C 1

Number of Farmers by Sex and Economic Status

Economic status	Number of farmers in								
	Vanier area			Regent area			Kanawa area		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)

Total population	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

From the above table it is seen that the proportion of women in the Border area, Frontier area and General area are respectively 71 per cent, 61 per cent and 55 per cent of the corresponding total population. Thus each earner has to support himself and roughly one dependent. Thus the burden of dependence is not very heavy in the district. This is because of the fact that men, women and children all are the labour force. Number of women engaged wholly on domestic work is few. Only in big landlords' houses a number of women, one or two of them are engaged in domestic work, otherwise the Khan women attend to the domestic work in addition to their work in the field.

From table G 2-1 in the appendix it will be seen that respectively 6.7 per cent, 3.8 per cent and 1.6 per cent of the persons in Border area, Frontier area and General area are below 15 years of age.

2.6—Attempt was made to study the employment position in the selected villages. For this purpose the following definition of employed and unemployed persons was adopted.

Persons working for pay or profit on one day during a period of 30 days preceding the date of enquiry would be classified as employed. Those who did not work on any day during the last 30 days, may be employed or unemployed. The person is unemployed if—

(i) He who was without a job for the whole reference period.

(ii) Who was seeking one, and

(iii) Who was in a position to accept job if offered one.

A person is also unemployed if he did not work because of his permanent illness, believed that no work was available, or was expecting to return to a job from which he had been indefinitely laid off.

On the other hand a person is employed if he had a job, although temporarily absent from work during the reference period due to illness, vacation, industrial dispute or being laid off temporarily. Also a person would be considered employed if he was waiting to take up a new job which he had been offered or to start a new business.

TABLE C4

Number of Persons Employed, Unemployed and available Labour force in the selected villages

Employment status	Hilly area				Rural area				General area			
	Male	Female	Total	P.C. to total population	Male	Female	Total	P.C. to total population	Male	Female	Total	P.C. to total population

	(34.19)	(38.45)	(100.00)		(50.42)	(39.42)	(100.00)		(34.86)	(40.14)	(100.00)	
2. Unemployed	0	0	0	0.00	—	—	—	—	—	—	—	—
	(00.00)	(00.00)	(00.00)									
3. Within labour force	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	(34.19)	(38.45)	(100.00)		(50.42)	(39.42)	(100.00)		(34.86)	(40.14)	(100.00)	
4. Outside labour force	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	(34.95)	(38.45)	(100.00)		(50.42)	(39.12)	(100.00)		(35.72)	(39.28)	(100.00)	
Total	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

[illegible] The above table speaks of the employment position in the three village groups. It will be seen that more than half of the [illegible] [illegible] working force the percentage for the general area [illegible] [illegible] in rural areas, [illegible] of unemployment is negligible. The few cases of reported unemployment from [illegible] were mainly due to inability to secure work due to [illegible] illness or inability to take up work [illegible] the time persons who were engaged by some employer and actually discharged. The percentage of reported persons is however not a true [illegible] of the employment situation of the rural population as the incidence of underemployment is very high. For agricultural population the work-force is rather very low owing to lack of development of the working persons. In some of the areas only one or two seasonal crops are raised each year. Labour population are even more hard hit. Considering the high percentage of labour population, work available to them is rather very small. There are instances as has been mentioned already—where labourers gather together early in the morning for work on wage basis and have to wait for a wage of 50 nP. a day. The picture is even more bleak for the Border area. Orchards and plantations are being less attended and a large section of cultivators and the labourers who were formerly working there have to look for alternative work for livelihood. This inevitably factor against the limited opportunities opened to them. The new relief schemes introduced by Government have succeeded in giving seasonal employment to these people only to a very limited scale.

9.7 The relative preponderance of different industrial census groups among the employed persons can be judged from the following:—

TABLE C.7

Industrial class	Border area		Project area		General area	
	No. of Persons	P.C. to total employed persons	No. of persons	P.C. to total employed persons	No. of persons	P.C. to total employed persons
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Employer	26	0.7[illegible]	1	0.06	3	0.[illegible]
2. Employee	650	22.[illegible]	[illegible]	[illegible]	64	0.[illegible]
3. Own account worker	1[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Total employed	2[illegible]	[illegible]	1576	[illegible]	[illegible]	[illegible]

The own account workers form the largest group comprising over 76 per cent, 86 per cent and 89 per cent of the total employed persons in the Border area, Project area and General area respectively followed

[illegible] 18 per cent, 19 per cent and [illegible] per cent respectively. It may be noted that the large number of families who engaged agricultural labourers on daily basis in and other occupations could be placed as 'employers'.

Occupations

1.8. In the following table attempt has been made to depict the occupational distribution of the population.

As agriculture is the principal occupation of the majority of the villagers, the following scheme of classification of occupations, has been adopted:—

[illegible]	Assam	G-3	[illegible]	[illegible]	[illegible]	Khasi	[illegible]

125
96.3

families have been classified into three main classes, viz.:—

(1) Wholly agricultural

(2) Partly agricultural

(a) Agriculture as principal occupation

(b) Agriculture as subsidiary occupation.

(3) Independent of Agriculture.

2.9. The following table shows the distribution of families by occupational type in the three village groups :—

TABLE C-6

96.2
96.3

Occupational distribution of families in different village groups

Occupational type	Sunder area	P. C. to total no. of families (Base total)	Pragna area	P. C. to total no. of families	General area	P. C. to total
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Wholly agricultural	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. Partly agricultural—						
(a) agriculture as principal occupation.	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
(b) agriculture as subsidiary occupation.	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3. Independent of agriculture.	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	100·00	[illegible]	100·00	[illegible]	100·00

It will be seen that wholly agricultural families, in Garo area, Jaintia area and Central area are 92.46 and 79 p.c. respectively of the total families. Classifying the "fully agricultural" families and families pursuing agriculture as principal occupation, as "predominantly agricultural families"—the proportion of such families for Garo area, Jaintia area and Central area stand at 98 p.c. 78 p.c. and 70 p.c. respectively. That is it is clear that in the Garo area the proportion of predominantly agricultural families is the lowest. The reason for this can be safely ascribed to the wicked, cardinal fact to-closure of markets after partition. A close study of tables G10 and G11 below and table G.12.1 at the appendix will bear testimony to the fact that in Garo area there is evidence of a shift of occupation from agriculture to non-agricultural occupies especially labour (non-agricultural).

Predominantly agricultural families have been classified into five groups:— Non-cultivating owner, owner cultivator, tenants, partitioner and part-tenants and landless agricultural labourers. The number of families and the proportion of each of these groups in the three areas are as follows:—

*162
241
423
463
427

TABLE C-9

Classification of Predominantly Agricultural Families

Type	Border area			Project area			General area		
	No. of families			No. of families			No. of families		
	Shifting cultivation	Jhum cultivation	Total	Shifting cultivation	Jhum cultivation	Total	Shifting cultivation	Jhum cultivation	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Non-cultivating owners...	25 (3·07)	6 (2·41)	31 (2·97)	.. ..	4 (1·02)	4 (0·88)	.. ..	.. ..	.. ..
2. Owner cultivators (owning 25 per cent or more of farm land).	275 (30·32)	90 (42·61)	365 (34·96)	128 (17·58)	175 (44·61)	303 (31·96)	70 (32·57)	40 (77·11)	110 (38·21)
3. Tenant (owning less than 25 per cent of farm land).	5 (1·10)	75 (35·50)	81 (11·91)	34 (4·68)	51 (13·14)	85 (13·04)	3 (1·40)	7 (13·42)	10 (4·86)
4. Part owner and part tenant (owning between 25 per cent and 75 per cent of farm land).	7 (1·54)	19 (9·00)	26 (2·49)	15 (2·06)	31 (8·00)	46 (7·17)	1 (0·46)	3 (5·76)	4 (1·94)
5. Landless agricultural labourers.	24 (7·47)	24 (11·38)	48 (10·11)	5 (0·69)	73 (18·81)	87 (13·56)	4 (1·87)	7 (13·42)	11 (5·37)
Total ...	443 (100·00)	211 (100·00)	679 (100·00)	185 (100·00)	334 (100·00)	449 (100·00)	213 (100·00)	52 (100·00)	205 (100·00)

Apart from private lands, Raj lands possessed by a family and land possessed through settlement by District Council have been considered as 'land owned' for the purpose of this survey. Tenants usually take in rents from land-owners only those lands which are possessed by the later as private land or through settlement through District Council. A perusal of table C 9 given above will show that proportion of tenants are higher in Jowai subdivision which is due to the existence in this subdivision of some big landholders who are known as zamindars. Majority of the families shown against 'non-cultivating owner' are in fact agricultural labour families who also possess some land but due to some reason or other left it uncultivated. Among owner cultivators, tenants and part-owner and part-tenant families also there are some whose major income is derived from agricultural labour. Consideration of these two facts along with the number of landless agricultural families goes to show that the proportion of agricultural labourers in the district is rather high. 423 463 427 125

TABLE C10

19: Assam 6-5 (1958) 1963 AR7 Khasi AR7

463 A perusal of the table above will show that proportion of families following non-agricultural labour as principal occupation is highest in 464 Border areas. Majority of these families were formerly engaged in [17] agriculture but due to adverse circumstances arising out of partition, one forced to take to other occupations. Test relief works and normal P. W. D. works gave employment to a large section of these people. Other avenues of employment are collection and carriage of limestone, 441 woodcutting, and carrying of merchandise, etc. Traders in stationery articles and groceries who formed the bulk of the traders in the border 433 area are largely the displaced persons and the Bengali people concentrated in Bholaganj and Balat. Others are petty traders dealing in fruits, 563 vegetables, fish, clothes and other foodstuff. Under small-scale manufacture, etc., come the liquor distillers, blacksmiths, carpenters, etc., Commission agents, fishermen, hunters, etc., are shown as others.

8.10 In the following table the families in the three village groups are classified according to their subsidiary occupation.

TABLE C-II

Predominantly agricultural families and Predominantly non-agricultural families classified according to their subsidiary occupation

7. Others	2 (1·19)	3 (1·44)	5 (1·32)	10 (10·52)	..	10 (4·74)	2 (5·41)	..	2 (3·64)
Total number of families having some subsidiary occupation	168 (100·00)	209 (100·00)	377 (100·00)	95 (100·00)	116 (100·00)	211 (100·00)	37 (100·00)	18 (100·00)	55 (100·00)
Total number of all families ..	679	327	1006	489	158	647	165	19	184
Percentage of families having sub-sidiary occupation to total No. of families	24·74	63·00	37·48	39·43	73·42	32·61	22·42	94·74	29·89

In the border areas 25 p.c. of the predominantly agricultural families had some subsidiary occupation, the most important of which was non-agricultural labour followed as trade. Majority of (64 per cent) of the predominantly non-agricultural families has some subsidiary occupation, the most important of which is agriculture accounting for 88 per cent of such families. 162* 463

The picture for the project area is more or less the same except that among agricultural families a relatively higher proportion of families have small scale manufacture as subsidiary occupation while trading is relatively less popular.

In the general area among the agricultural families with some subsidiary occupation the majority are engaged in small scale manufacture as subsidiary occupation, labour occupying a minor place. Almost all the predominantly non-agricultural families have agriculture as subsidiary occupation.

5.11 The following table shows the distribution of employed persons according to major industry groups (according to principal occupation).

TABLE C-12

Distribution of employed persons by Industries

Name of industry	No. of persons		
	Border area	Project area	General area
(1)	(2)	(3)	(4)
1. Agriculture	1441 (71·94)	1225 (77·93)	498 (88·45)

Total	2063	1572	563

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

*162 464 433

As is expected, agriculture comes out to be the single major industry giving employment to about 3/4th of the employed persons. In Border area this accounts for 72 per cent of the total employed persons. Among the other industries giving employment to the rest of the employed persons come in order of importance, construction (8 per cent), trade and commerce (6 per cent), mining and quarrying (6 per cent) and manufacture such as manufacture of foodstuff, production of garmets, other wood and stone products (4 per cent). In Project area, apart from agriculture which accounts for 78 per cent other industries in order of importance of employment come construction (11 per cent), service and profession, manufacture, trade and livestock (2per centeach), and rearing (4 per cent). In General area agriculture gives emploment to 88 per cent of the population. Next to it come livestock rearing, manufacture and forestry which account for 6 per cent and 2 per centrespectively of the total employed persons.

CHAPTER VI

LAND

6.1 The total area covered by the sample villages is not available for want of relevant village records as the district is not cadastrally surveyed for settlement purposes. Having no alternative on matters of land and land utilisation pertaining to a family we had to depend entirely on the accounts given by family concerned. However, every care was taken to ensure reliability and in a number of cases accounts of land given by families were verified by actual measurements. In most cases they were found to tally approximately. To simplify matters land referred hereafter relates only to agricultural land. 12 423 162*

HOLDING

6·2 "Holding' usually means the land over which the individual or family has permanent and heritable right of occupancy. Due to peculiar land tenure system prevailing in this district, an account of which has already been given in the introductory chapter, this definition had to be modified to fit in with the system obtaining in the district and accordingly the holding of an individual or family was meant to comprise of all lands held as private property or held under Raj System or under settlement through District Council.

The total area covered by land holdings of all sizes in the Border area, Project area and General area samples are respectively 5366.42 acres, 1891.42 acres and 613.24 acres and with 1006, 647 and 184 families in the respective sample. The average size of holding per family works out respectively at 5.3 acres, 2.9 acres, and 3.3 acres in Border area, Project area and General area and holding per head 1.48 acres, 0.63 acres and 0.70 acres respectively. The real situation on the structure of family holding, however, will be better understood from an examination of the distribution of the holdings according to their size as presented in the following table.

*162

Total no. of families possessing land	697 (69·28)	7·70	631	5·13	462 (71·41)	4·09	453	3·41	165 (89·67)	3·72	164	3·21
Grand Total	1006 (100·00)	5·33			647 (100·00)	2·92			184 (100·00)	3·23		

It is seen from the above table that proportion of landless families was quite high in Border area and Project area accounting for 31 and 29 per cent of the total number of families in the respective area, against 10 in the General area. Considering holdings in general and classifying them as small holdings (if less than 3 acres), medium holding (if 3 acres to less than 10 acres) and large holdings (if 10 acres and above), the proportion of families holding land in the three holding groups is found to be respectively 56 per cent, 26 per cent and 18 per cent in Border area, 67 per cent 26, per cent and 7 per cent in Project area and 55 per cent, 39 per cent and 6 per cent in General area.

1627
592
423

Considering only the families holding land as will be evident from table D1.1 in the appendix in Border area, the proportions of families in the three holding groups, *i.e.*, small, medium and large are respectively 37%, 37% and 26% of the families holding land while for Project area they are 54%, 37% and 9% and for General area 50%, 44% and 6% respectively.

As to the area covered by the three holding groups in the Border area, Project area and General area, the small holding cover respectively 6 per cent 19 per cent and 21 per cent of the total agricultural land medium holdings cover respectively 28 per cent, 45 per cent and 59 per cent, and the large holding cover 66·32 per cent, 35·50 per cent and 20,42 per cent respectively. Thus in Border area 37 per cent of the families holding land own only 6 per cent of the total agricultural land in the villages while in Project area 54 per cent of the families own 19 per cent in the land and in General area 50 per cent of the families own 21 per cent of total land. As a result the individual holdings under the small holding group are small measuring between 0·24 acres to 2·26 acres in Border area, 0·25 acres to 2·28 acres in Project area and 0·25 acres to 2·30 acres in General area. The average size of holdings per family in the small holding group in the three areas are respectively 1·36 acres, 1·47 acres and 1·55 acres as compared with 5·63 acres, 4·05 acres and 5·02 acres in the medium holding group and 19·55 acres, 15·25 acres and 12·53 acres in large holding group. Average size of holding per family holding land in Border area, Project area and General area comes to respectively 7·70 acres, 4·09 acres and 3·72 acres. However considering cultivated holdings only as will be shown by Table D1.1 at the appendix, the above figures stand at 5·13 acres, 3.41 acres and 3·21 acres respectively crystalising the fact that a considerable portion of land is either left fallow or leased out to others.

The following table will throw light on the point.

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

*163 241 423 427

TABLE D2

Village group	No. of families holding land	Total area of holding (acres)	No. of families renting out land	Area leased out (acres)	No. of families cultivating owned land	Area cultivated (acres)	Area left fallow	Percentage to col. 3
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
1. Border area	697	5366·42	39	251·41	631	3239·66	1876·35	34·96
2. Project area	462	1891·42	27	91·56	453	1543·56	256·30	13·55
3. General area	165	613·24	5	16·75	164	526·45	70·04	11·41

Thus it is seen that of the owned land at least 35 per cent in Border area, 14 per cent in Project area and 11 per cent in General area were left fallow.

Considering the number of families, it was found that in Border area villages as many as 66 families had either totally leased out or left fallow their owned land, the corresponding number for Project area and General area being only 9 and 1 respectively.

TABLE D3

Number of families of different occupational type holding land of various sizes

4. 3 to less than 10 acres	113 (28·68)	29 (30·53)	26 (24.07)	1 (2·00)	169 (26·12)
5. 10 acres and above..	15 (3·81)	17 (18·09)	12 (11·14)	..	44 (6·81)
Total ..	394 (100.00)	95 (100·00)	108 (100·00)	50 (100·00)	647 (100·00)

TABLE B3 (*contd.*)

(1)	(2)	(3)		(5)	(6)
*162 241 423 3. General area—					
1. No land	15 (11·72)	1 (2·70)	(11·76)	1 (50·00)	17 (10·33)
2. Less than 1 acre ..	9 (7·03)	4 (10·81)	5 (29·41)	1 (50.00)	19 (10·33)
3. 1 to less than 3 acres	47 (36·71)	10 (27·03)	7 (41·19)	..	64 (34·78)
4. 3 to less than 10 acres	52 (40·63)	17 (45·91)	3 (17·64)	..	72 (39·13)
5. 10 acres and above	5 (3·91)	5 (13·52)	...	... ..	10 (5·43)
Total ..	128 100·00	37 100·00	17 100·00	2 100·00	184 100·00

6.3 It is significant that in all the three areas a considerable section of wholly agricultural families and families following agriculture as principal occupation are landless. On the other hand, a considerable proportion of the families with agriculture as subsidiary occupation or independent of agriculture hold land of various sizes. The fact why agriculture for those families who possessed sufficient land, was reduced to a subsidiary occupation is possibly more due to less return from agriculture than their attachment to it.

FRAGMENTATION

182 311 423 6.4 It has been observed that a large number of rural families have small holdings, the very smallness of which render their holdings un-economic. In addition, the holding of rural families suffer most from the evils of fragmentation. Often holdings are not in compact blocks but are scattered all over and surrounded by lands in possession of others or some uncultivable waste land. Some of the fragments lie even in separate villages.

Unlike in the plains district, fragmentation here was brought about not so much by population pressure (except only in case of wet paddy field) or inheritance legislations or such other factors as would give rise to excessive fragmentation of holdings. This is because there is no settlement regulation and the people are free to reclaim as much of the Raj land as possible for their cultivation. Fragmentation here is thus more a product of the topography of the district, for cultivable land in large compact block is not easy to get and cultivable land have to be found in isolated patches.

The extent of fragmentation is presented in the following table :

TABLE D-4

Distribution of holdings according to number of fragments.

182
311
423

No. of fragments	Border area		Project area		General area	
	No. of holdings	Percentage	No. of holdings	Percentage	No. of holdings	Percentage

19	1		..			..
20	2		—			—
21 & above	0		..			..
Total.. ..	697	100	482	100	195	100

311 The total number of fragments in 697 holding in Border of area
423 is 2,540 giving an average of 3.64 fragments per holding, that in
182 462 holdings in project area is 1,080 which gives on the average 2.34 fragment per holding, while in General area 165 holdings comprise of 443 fragments, *i.e.*, 2.68 fragment per holding. A comparison of the above figures with the average fragment figures of 1.61, 4.50, 4.40 and 3.73 per holding in Mikir Hills, Darrang, Sibsagar and Lakhimpur districts respectively goes to show that incidence of fragmentation in this district is higher than that in Mikir Hills but less than that in other districts.

It will be seen from table D4.1 at the appendix that in the small holding group (less than 3 acres) average number of fragments per holding is 1.99 in Border, 1.60 in Project and 2.01 in General area. The average sizes in the corresponding holding group being 1.36 acres 1.47 acres and 1.55 acres, in Border area, Project area and General area, the average size of fragments in the respective area works out at ·68 acres, ·92 and ·76 acres. Similarly it will be seen that average sizes of fragments for medium holding group are, in Border area 1.61 acres (average size of medium holding 5.63 acres) in Project area 1.85 acres (averages size of holding 4.95 acres) and in General area 1.51 acres (average size of holding 5.03 acres), those for large holding group being 3.15 acres, 3.06 acres and 3.49 acres respectively against the average large holding sizes of 19.55 acres, 15.25 acres and 12.53 acres in the respective area.

FARMS

241 6.5 The operating unit in the rural agricultural system is in most
592 cases the family farm. Functions, entrepreneur, capital and manual labour as regards to the agricultural operations in these farms are done through a joint effort of the family unit. Rarely permanent farm servants are maintained though employment of casual labourers are employed during the busy seasons.

[128] In this enquiry a farm has been defined as comprising of all agricultural land operated by a single family with or without employment of labour. The family may or may not have the right of permanent occupancy and inheritance over the farm land operated by it, and in this sense the farm is distinguised from holding which comprises of such land only over which the family concerned possesses right of occupancy and inheritance.

TABLE D-5

Distribution of farms according to size

6.6 The summary distribution of farms in the three areas is shown in the following table:—

Size of farm (in acres)	Border area			Project area			General area		
	No. of farms	Total area (acres)	Average size of farm (acres)	No. of farms	Total area (acres)	Average size of farm (acres)	No. of farms	Total area (acres)	Average size of farm (acres)

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

341
311

It will be seen from the above table that the total number of farms in each of the three areas is greater than the number of holdings in the corresponding area. There are 759 farms in Border area villages, covering a total areas of 2918.18 acres, whereas the corresponding figures in case of holdings, as we have already seen, are 697 and 5166.42 acres. In Project area 511 farm cover an area of 1898.79 acres, the corresponding figures being 462 and 1891.42 acres, while in General for holding area there are 171 farms which cover 575.81 acres as against 165 holdings covering an area of 613.24 acres. Two reasons may be attributed to these differences. In the first place, proportions of village land are owned by people from outside and rented out to people of the village. Secondly, there are some among the right holders who cultivate only part of their land and the remaining portion is either left fallow or leased out to others. The position will be made clear from a study of subsequent tables viz., D-6 and D-7 given elsewhere in this chapter.

The average size of farms for Border area, Project area and General area respectively are 5.16 acres, 3.54 acres and 2.20 acres which again are less than the corresponding figures of holding of 7.79 acres, 4.09 acres and 3.72 acres. The average size of farm is, however, hardly an adequate measure for judging the conditions of the farmers in as much a large proportion of cultivators (44%, 54% and 53%, in Border area, Project area and General area respectively operates small size farms of less than 3 acres (exact average being 1.33 acres for Border, 1.56 acres for Project and 1.66 acres for General area) and the total farm area cultivated by these cultivators constitute only 11%, 42% and 46% of the total farm areas in the Border area, Project area and General area respectively. In these areas proportion of families operating middle-sized farms, *i.e.*, between 3 to less than 10 acres are 41%, 40% and 42% covering respectively 42%, 56% and 58% of the total farm areas in the respective village group. Proportion of families operating large sized farms, *i.e.*, 10 acres and above in Border area, Project area and General area is respectively 15%, 6%, and 5%, possessing a comparatively bigger slice of farm land amounting to 47%, 22 per cent and 18 per cent of the total farm land in the respective area.

6.7 The following two tables give the distribution of farms and farm areas respectively according to size and ownership.

TABLE D-6

Distribution of farms according to size and ownership

Large farms— (10 acres and above)	324·77	23·00	35·25	17·00	52·25	360·02	40·00	400·02
Total	1420·45	129·44	123·11	135·79	258·90	1543·56	265·23	1808·79
	(78·53)	(7·16)	(6·81)	(7·50)		(85·34)	(14·66)	(100·00)
C. General area—								
Small farms— (less than 3 acres)	126·08	7·25	8·57	9·25	17·82	134·65	16·50	151·15
Medium farms— (3 acres to less than 10 acres) ...	300·07	8·00	7·73	16·86	24·57	307·80	24·86	332·66
Large farms— (10 acres and above)	80·00	—	4·00	8·00	12·00	84·00	8·00	92·00
Total	506·15	15·25	20·30	34·11	54·39	526·45	49·36	575·81
	(87·90)	(2·65)	(3·53)	(5·92)	(100·00)	(91·43)	(8·57)	(100·00)

From the above tables it is evident that for all the areas in each size group small, medium and large, a high proportion of the farms (*i.e.*, in total 76 per cent in Border area, 78 per cent in Project area and 86 per cent in General area) is wholly owned and the area covered by those wholly owned farms also constitutes almost similar high proportions (*i.e.*, 79 per cent in Border area, 79 per cent in Project area and 88 per cent in General area) of the farm area available in the respective village group. Owned area under all farms amounts to 3238·66 acres (83 per cent of the total farm area) in Border area, 1543·56 acres (85 per cent) in Project area and 526·45 acres (91 per cent) in General area. Of this total owned area, in Border area nearly 95 per cent is covered by wholly owned farms and the rest by the partly owned farms. In Project area and General area respectively 92 per cent and 96 per cent of the total owned area are covered by wholly owned farms. Thus the area available for renting in Border area constitutes 17 per cent of the total farm land amounting to 675·52 acres of which 71 per cent is under wholly rented farm and 29 per cent under partly owned farm, in Project area total area available for renting constitutes 15 per cent (*i.e.*, 265·23 acres) of the total farm area of which 49 per cent and 51 per cent respectively are under wholly rented and partly owned farms while in General area 8·57 per cent (49·26 acres) of the total farm area are available for renting of which respectively 31 per cent and 69 per cent are covered by wholly rented and partly owned farms.

It is seen from Table D-7, that total rented area in Border area, Project area and General area are respectively 675·52 acres, 265·23 acres and 49·36 acres. A comparison of these figures with the figures of land leased out as in Table D-2 which are respectively 251.41 acres, 91·56 acres and 16·75 acres in the three areas, goes to show that some of the village lands taken in rent by the villagers belong to some right-holders who live outside the village.

CHAPTER VII

Rural Indebtedness

426 7.1. As Rural indebtedness is a problem of great importance we have attempted below to reproduce the extent of indebtedness in the rural areas of the district. During investigation account was taken of all loans of which at least a part was outstanding on the date of investigation.

7.2. The following table shows the number of indebted families in the three village groups :

TABLE E-1

*162 426

Number of indebted families and amount of loan outstanding in the three areas:

Village group	Total No. of families.	No. of indebted families	P. C. of indebted families	Amount of loan outstanding (Rs.)	Average amount outstanding: Per family (Rs.)	Average amount outstanding: Per indebted family (Rs.)
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Border area ..	1006	630	62	1,58,289	157·34	251·25
Project area ..	647	322	50	89,510	138·35	277·508
General area ..	185	52	28	9,364	50·89	18·000

Thus 62 per cent of the families in Border area, 50 per cent in Project area and 28 per cent in General area are indebted, the average amount outstanding per family in the corresponding area being Rs. 251.25, Rs. 277.50 and Rs. 180,08 respectively. All these prove beyond doubt that rural indebtedness in the district is high. It will be seen from a subsequent table that Government loan constitutes the largest portion of the total amount of loan in these Border area villages. It will also be seen that per family indebtedness is highest in Project area. This is, however, apt to be inflated in view of the fact that from Project area, villages where intensive development activities were taken up by Project, were selected and these villagers happened to receive various kinds of loans from Project. Loans were taken both in cash and kind. Kind loans, however, were not frequent. It was found that value of kind loans constituted only 2 per cent, 19 per cent and 22 per cent of the total amount of loans in Border area, Project area and General area respectively. Kind loans are usually taken as follows :

426 Firstly when agricultural produce fails to meet the annual requirements of the people they resort to grain loans. Secondly, some Government loan, particularly agricultural loan disbursed by Project area, are given partly in cash and partly in kind.

7.3. As a study of the occupational distribution of these indebted families may be useful, in the following table, indebted families are classified according to their principal occupation.

TABLE E-2

Debts by principal occupation

Principal occupation	Total No. of families	No. of indebted families	Amount of loan outstanding (Rs.)	Average amount outstanding per household (Rs.)
(1)	(2)	(3)	(4)	(5)
A. Border area :—				
1. Agriculture ...	697	458	90,516	197·63
2. Labour ...	188	103	16,745	162·51
3. Service, Profession, etc. ..	84	19	28,310	1490·00
4. Trade ..	65	29	16,188	558·20
5. Small scale manufacture and handicraft ..	23	13	4,910	377·69
6. Poultry and diary, farming, etc. ..	7	3	1,200	400·00
7. Others ..	10	5	420	84·00
Total : ..	1,006	630	1,58,289	251·25
B. Project area—				
1. Agriculture ..	489	249	69,595	279·50
2. Labour ..	70	33	2,740	80·30
3. Service profession, etc.	39	17	5,755	338·53
4. Trade ..	21	8	2,035	254·38
5. Small scale manufacture and handicraft.	19	11	8,275	752·27
6. Poultry and diary farming, etc. ..	..	..	..	..
7. Others ..	9	4	1,110	277·50
Total: ..	647	322	89,510	277·98

463

Principal occupation	Total No. of families	No of indebted families	Amount of loan outstanding (Rs.)	Average Amount outstanding per household (Rs.)
(1)	(2)	(3)	(4)	(5)
C. General area:—				
1. Agriculture ..	165	51	9,264	181·65
2. Labour ...	6	1	100	100·00
3. Service profession, etc.	3	..	..	..
4. Trade ..	4	.	..	..
5. Small scale manufacture and handicraft.	1	..	..	..
6. Poultry and diary farming, etc. ..	5	..	..	..
7. Others ..	...	...	..	...
Total: ..	184	52	9,364	180·08

From the above table it will be seen that predominantly agricultural families constitute the highest proportion of the indebted class in all the three areas. In Border area they constitute 73 per cent of the total number of indebted families, accounting for 57 per cent of the total amount of loan. In Project area and General area these proportions were respectively 77 per cent, 98 per cent and 99 per cent. It is clear that in Border area, average amount of loan per family is higher of the non-agricultural class which ranges from Rs. 377·69 nP to Rs. 1,490·00 nP. These averages, as a matter of fact were inflated due to inclusion of a few families in each class who have very high amount of outstanding loan ranging from Rs. 600 to Rs. 10,000 per family. Otherwise indebtedness in agricultural and non-agricultural class did not visualise any wide difference. In Project area indebtedness among agricultural families is definitely higher than that among their counterparts in Border area and they accounted for a fair proportion (78 per cent) of the total amount of loan. Different occupational groups in non-agricultural class, of course, revealed among themselves wide variation in average per family indebteness ranging from Rs. 80 to Rs. 752 per family. On the other hand, in General area, agricultural families account for almost the entire amount of loan.

Per family indebtedness taking all the families into consideration stands at, for Border area Rs. 157·34, for Project area Rs. 138·35 and for General area Rs. 50·89.

7.4. As has already been mentioned, the average debt per family worked out above does not reflect the true picture of indebtedness in the areas. The following table is illustrative.—

TABLE E-3

Distribution of loans in different amount groups

Loan group (Rs.)	Border area			Project area			General area		
	No. of loan	Amount (Rs.)	Average (Rs.)	No. of loan	Amount (Rs.)	Average (Rs.)	No. of loan	Amount (Rs.)	Average (Rs.)
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Below Rs. 100	449	15,251	33·97	249	10,770	43·25	17	857	50.41
	(41)	(9)		(49)	(12)		(28)	(8)	
2. Rs. 100 to below 200 ..	497	50,855	10 12	111	13207	118·98	26	2979	114.58

TABLE E-3—*concld.*

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
3. Rs. 300 to below 500 ..	71	18,700	263·38	103	26,390	256·21	12	2800	233.33
	(7)	(11)		(20)	(29)		(20)	(28)	
4. Rs. 500 to below 1,000 ..	39	24,450	626·92	34	21,370	628·53	4	2100	525·00
	(4)	(15)		(7)	(24)		(7)	(21)	
5. Rs. 1000 to below 2,000 ..	13	25,620	1201·54	7	7,500	1071·43	1	1,300	1300·00
	(1)	(9)		(1)	(8)		(2)	(13)	
6. Rs. 2,000 and above ..	12	43,830	3652·50	4	10,400	2600·00	..	..	..
	(1)	(26)		(1)	12	..	..	..	..
Total	1081	168106	155·51	508	89637	176·45	60	10086	167·27
	(100)	(100)		(100)	(100)		(100)	(100)	

From the above table it is clear that majority of the loans are of small amounts. In Border area as many as 87 per cent of the loans are of size less than Rs. 200 (average Rs. 69.25 only) covering only 39 per cent of the total amount of loan. The corresponding figures for Project area are 71 per cent (average Rs. 66·60) and 27 per cent and for General area 72 per cent (average Rs. 89·20) and 38 per cent. Thus in Border area there were 135 big loans ranging from Rs. 263·38 to Rs. 3652·50, in Project area 148 big loans ranging from Rs. 256·21 to Rs. 2,600·00 and in General area 17 big loans ranging between Rs. 233·33 to Rs. 1,300·00 which have given considerable weight in raising the average figure of per family indebtedness.

426

7.5 It has been observed that majority of the loans are of shortstanding particularly those in Project area and General area. The following table will be illustative

TABLE E-4

Period of Standing of Loan	Border area		Project area		General area	
	No. of loan	Amount of loan (Rs.)	No. of loan	Amount of loan (Rs.)	No. of loan	Amount (Rs.)
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Less than 3 years ..	721	92,466	421	72,714	54	8,236
	(67)	(55)	(83)	(81)	(90)	(82)
3. 3 to less than 5 years	318	48,120	66	11,083	5	500
	(29)	(29)	(13)	(12)	(8)	(5)
4. 5 years and above ..	42	27,520	21	5,840	1	1,300
	(4)	(16)	(4)	(7)	(2)	(13)
Total.	1,081	1,68,106	508	89,637	60	10,036
	(100)	(100)	(100)	(100)	(100)	(100)

Thus in Border area, Project area and General area respectively 67 per cent, 83 per cent and 90 per cent of the total number of loans in the respective area were contracted during the three years preceding the enquiry respectively covering 55 per cent, 81 per cent and 82 per cent of the total amount of loans in the respective areas. In Border area out of 1081 loans, 360 numbers of loans (33 per cent) were of more than 3 years standing, the corresponding figures for Project area and General area being 87 (*i.e.*, 17.12 per cent) and 6 (*i.e.*, 10 per cent). A comprehensive analysis of the component parts of these loans will be found in Table E-4 at the appendix.

426
453
659

7.6 Th purposes for which the loans were incurred and different sources of loans are summarised in the following table :—

TABLE E-5

426
452
659

426 A close scrutiny of table above, shows that families contracted loans for productive as well as unproductive purposes, the bulk of them apparently being for productive purposes. In Border area out of 1081 loans, as many as 850 loans (79%) accounting for 43% of the total amount of loan were incurred for agricultural purposes other than purchase of land and draught animals followed by 116 loans (11%) accounting for 28% of the total taken for other purposes which included some Government loan such as Relief and Rehabilitation loans, etc., and other loans taken from private persons for meeting medical expenses which is considerable in Border area and other necessities. Next to it in order of importance come the loans for normal maintenance and for running houshold enterprises, the number on respective item being 60 (6%) and 27 accounting for 7% and 15% of the total amount of loans. Individually loans for running household enterprises are of biggest amount, being Rs. 952.04 on the average.

Though the majority of the loans were incurred for productive purposes, replies given by the loanees during enquiry, suggest that the major portion of these loans was spent on normal maintenance. This was particularly the case with Government loans given in Border area.

In Project area out of a total of 508 loans, 255 loans (50%) were contracted for agricultural purposes covering 31% of the total amount of loan, followed by loans for normal maintenance and for other purposes, number of loans for the respective categories being 160 (32%) and 56 (11%) accounting respectively for 4% and 12% of the total amount of loan.

In General area out of a total of 60 loans 32 (53%) were incurred for normal maintenance accounting for 51% of the total amount of loan. Next come the 19 loans contracted for agricultural purposes which accounted for 32% of the total amount of loans again followed by 8 loans taken for other purposes accounting for 16% of the total amount of loan.

7.7 These loans were, as will be seen from the above table, taken from various sources. In all the areas, however, Government and money lenders eclipsed the other sources. In Border area, for example, Government loans constitute 82% of the total number of 1081 loans accounting for 53% of the total amount of loan, followed by loans from money lenders and Mahajans which constituted 15% of the total number of loans and covered a comparatively much higher proportion (41%) of the total amount of loans pointing to the significance of individual loans. Next to them are the loans from other sources which included friends and relatives, followed by those from owners of land.

In project area loans from private money lenders constitued 50% of total number of loans (508) covering a little less than ¾th (70%) of the total amount of loan, followed by Government loans for which the corresponding figures are 45% and 26%. The remaining 5.12% of the total number of loans accounting for 3·61% of the total amount are taken in order of importance, from owner of land, Co-operative Societies and 'other' sources.

In General area out of a total of 60 loans 45 loans (75%) accounting for 84% of the total amount are from money lenders followed by 10 loans from Government and five loans from owners of land accounting respectively for 11 per cent and 5% of the total amount. 426

Thus it is seen that money lenders are still holding sway among the poor people in the rural areas.

7.8 The following table summarises the position with regard to the interests borne by different parts of the rural debt. The calculation of rates of interests presents difficulties in the case of loans taken in kind or in cash on condition of selling the crop after harvest to the creditors or rendering labour at less wages at creditor's farm during busy agricultural season. In case of such loans the interest rates given here are as ascertained on the basis of the information furnished by the debtor regarding the amount of produce to be given to the creditor, or number of man-days worked on creditor's farm in repayment of principal and interest.

TABLE E-6

Debts classfied according to rate of interests

Rate of interest	No. of loans	P. C. to total no of loan	Amount (Rs)	Percentage to total amount of loan	Average amount of loan (Rs)
(1)	(2)	(3)	(4)	(5)	(6)
Border area—					
1. Free of interest	882	82	87,549	52	99·32
2. Less than 5 per cent	4	..	3,425	3	1106·25
3. 5 per cent and less than 10 per cent ..	49	4	21,000	13	440.82

7. 50 percent and less than 100 per cent	14	23	2,299	23	164·21
8. 100 per cent and less than 200 per cent	...	..	...	..	..
9. 200 per cent and above	...	...	..	...	...
Total	60	(100)	10,036	100	

It is seen that proportion of interest free loans are 82 per cent in Border area accounting for 52% of toal amount of loan, 18% in Project area which cover 14% of the total amount of loan and that in General area being 20% covering 10% of the total amount of loan. The reason behind the unusually high proportion of interest free loans in Border area was that most of the Government loans were free of interest. Thus only 18% of loans in Border area bear interest whereas as much as 82% in Project area and 80% in General area bear interest ranging even up to 200%. It has been found that loans contracted from friends and relatives are free of interest, those from money lenders and other village Mahajans are usually of very high interests and as has already been mentioned in Project area and General area they constitute the major portion of the loans. It will be seen from table above that proportion of loans with interest between 20%— 100% and 100% to above 200% are repectively in Border area 7% and 2% only in Project area 29% and 1% and in General area 60% and nil.

CHAPTER VIII

Farm Output and sale

8.1 As a large majority of the family income is mainly from their farms, an attempt is made below to analyse the data collected on farm output, disposal and sale of produce. The data relate to the agricultural year March, 1957 to February, 1957. 241 433

8.2 **Output:** The following table sets forth some interesting data on farm output average cultivated area, etc. of cultivators by value groups.

TABLE F-1

4000 and above	..	4	6	10	—	..	2	2	..	..	..	..

As is to be expected, large output groups are associated with higher farm size groups. It will also be seen that proportion of farms with an output of less than Rs. 500.00 per annum in Border area, Project area and General area are respectively 67 per cent, 55 per cent and 60 per cent. A joint consideration of the proportions and the size of cultivated area in the three groups indicates that the large majority of farms in Border area are less profitable than those in the other two areas though the farms in Border area are sown with very rich cash crops. This is further amplified by the fact that in Border area of the total number of farms fetching less than Rs. 500.00 a year, 35 per cent are medium sized farms and 4 per cent are large sized farms, the corresponding percentages for the Project area being 21 per cent and 1 per cent and for General area 27 per cent and 1 per cent respectively.

8.3.—The following table summarises the data on relative importance of crops, harvested area under different crops, average yeild of crops and sale proceeds, etc.

TABLE F-3

Yield rate of some important crops

(c) Potato here relates to potato harvested in winter months.

241
433
435

241 311 433 **8·4—Relative importance of crops**—Total gross farm area harvested amounted to 3324.48 acres in Border area, 1700.40 acres in Project area and 561 acres in General area.

From above table it will be seen that in Border area, orange accounted for the highest proportion of harvested area, *i.e.*, 31 per cent, followed in order of importance by betel nut, paddy, betel leaf and millet which respectively accounts for 17 per cent, 19 per cent, 9 per cent and 3 per cent of the total harvested area. Other crops which account for 248.68 acres (7 per cent) includes maize, tezpata, banana, turmeric, dal, blackpepper and other fruit crops.

Considering sale proceeds, it is clear that betelnut happens to be the main earner accounting for 60 per cent of the total sale proceeds followed by orange, paddy and betel leaf which respectively account for 22 per cent, 6 per cent and 5 per cent of the total sale proceeds. Thus orange and betel leaf which in pre-partition days were the main earner-crops in the Border area have been passed to second and forth position respectively—the proportions fetched by them, particularly by betel leaf, being negligible. On other hand as there is a good market for betel nut, Border people have taken to betel nut cultivation in a more extensive scale.

241 245 311 433 It is significant that while in Border area total farm area is 3914 acres, total area harvested comes to only 3325 acres including area under mixed cropping which is in wide practice in Border area particularly for orange, betelnut, and for some other minor crops. Thus proportion of unharvested farm area emerges out to be considerable which can be accounted for the following reasons:—

(1) The farm area includes some new gardens particularly of betelnuts which usually take quite a few years to bear fruits.

[44] (2) Reportedly a large number of orange and betel-leaf gardens were not harvested at all as there was no market for them.

241 433 44 Turning our attention to Project area and General area, it will be found that paddy eclipses all other crops in as much as in the two areas it respectively covers 82 per cent and 61 per cent of the total harvested area in the respective area. In Project area paddy is followed by Betel leaf, orange, potato and betelnut in order of importance while in General area it is followed by potato, millet, orange, betel leaf and betelnut. In both the areas as will be seen from table above, almost all the crops retain their respective position in value. Considering sale proceed, in Project area, paddy occupies the highest position accounting for 77 per cent of the total sale proceeds followed by betel leaf, orange, betelnut and potato accounting respectively for 8 per cent, 5 per cent, 5 per cent and 1 per cent of the total sale proceeds. In General area, in order of importance of sale proceed paddy, potato and betelnut are worth mentioning fetching respectively 45 per cent, 30 per cent and 4 per cent of the total sale proceeds.

8·5—In the following paragraphs we have reproduced the yield rates of different crops, calculated on the basis of area harvested and total produces reported by the cultivators. For assesment of correct yield rates it is necessary to conduct a scientifically designed crops cutting survey which in view of its largeness in magnitude and other complexities associated with the type of experiments, could not be fitted in with the programme of the present survey. It is admitted that the yield estimates worked out by us are proved to be subjected to the usual limitations of this type of data. 128 433

Yield

1. **Paddy.**—It will be seen from table above that average yields of paddy per acre for Border area, General area and Project area are respectively 8.38 maunds, 12.92 maunds and 12.60 maunds and for the district as a whole it comes to 11.65 maunds though there are cases where maximum yield goes to above 18 maunds per acre. Thus it is seen that the average yield is much less than the average yield for the State of Assam (plain district) which is above 18 maunds per acre. Average yield in Border area is evidently much smaller. Apart from low fertility of land, another reason for this low average is that in a number of villages selected from Border area such as Syndai, Amki and Lumshnong, there was widespread havoc to standing crops was caused by wild elephants. 243 433 [136]

2. **Potato.**—The average for the three areas comes to 21·61 maunds per acre which is in contrast to the State average of above 40 maunds per acre. Our estimate has in fact been lowered due to inclusion of a few villages in the foot hills where potatoes don't grow well, otherwise in a number of high altitude villages, yield per acre well exceeded 40 maunds. The average for Border area is rather too low. Apart from unsuitability of Border land of high altitude potatoes another reason for this low average is that during the reference year the crop suffered from widespread incidence of pests and insects. 244 433 [136]

3. **Orange.**—yield of orange in Border area, Project area and General area was found to be 5. 27 luties or 5396 numbers against 16.76 luties or 17162 numbers and 2.80 luties or 2867 numbers respectively Thus the average yield in Border area, even considering the mixed nature of some gardens is much low. The reasons are obvious. 245 433

4. **Betelnut**—Average yield per acre from Border area, Project area and General area was found to be 2.93 luties (18752 numbers), 4.11 luties (26304 numbers) ann 3.03 luties (19392 numbers) respectively bringing the average for all the three areas to 2.95 luties per arce. 249 433

5. **Betel leaf.**—Average yield per acre works out at 17·15 kuris, 50.64 kuris and 24 kuris in Border area, Project area and General area respectively. Thus in Booder area the average is much lower. This is due to the fact that most of the gardens remained unplucked for want of market for leaf.

CHAPTER IX

Income and Expenditure

434 592 9·1 The great majority of rural people are members of families of two or more persons sharing a common income earned mostly by joint efforts of family members an also disbursed in supplying the consumption needs of the family as a whole. An attempt is made below, therefore, to analyse the aspects of income and expenditure of the rural families family-wise.

434 463 592 9.2 It has already been mentioned that the majority (*i.e.*, above 75 per cent) of the families of all the three areas pursued agriculture as a principal occupation. Some of these families follow cottage industries, trade, transport, labour, etc. as subsidiary occupations. The rest of the families had either agriculture as subsidiary occupation or were independent of agriculture. The larger section of these families were non-agricultural labourers. The following table gives the distribution of families in different income groups.

TABLE G-1

Frequency distribution of families in different income groups

Income Group Rs.	No. of families: Border area: Mainly agricultural	Border area: Non-agricultural	Border area: Total	Average annual gross income per family (Rs.0.00)	Project area: Mainly agricultural	Project area: Non-agricultural	Project area: Total	Average annual gross income per family (Rs.0.00)	General area: Mainly agricultural	General area: Non-agricultural	General area: Total	Average annual income per family (Rs. 0.00)

11. 3500 to below 4000	6 (.88)	5 (1.25)	11 (1.09)	3,710.27 ..	1 (.20)	1 (.24)	9 (.91)	3,892.00 ..	.. ..	.. ..	.. ..	.. ..
12. 4,000 & above	13 (2.21)	17 (3.00)	37 (3.18)	5,776.18 ..	5 (1.04)	16 (3.82)	24 (3.78)	6,175.42 ..	.. ..	.. ..	.. ..	.. ..
Total ..	679 (100.00)	527 (100.00)	1,166 (100.00)	10,96[illegible] ..	488 (100.00)	418 (100.00)	647 (100.00)	1,399.[illegible] ..	2[illegible] (100.00)	3[illegible] (100.00)	1[illegible] (100.00)	[illegible] ..

From table above, it is difficult to judge the relative prosperity of agricultural and non-agricultural families. The annual gross income of 49 per cent of the agricultural families is less than Rs.750 a year while that of 87 per cent of them is below Rs.1,500 a year. Thus the remaining 13 per cent of the families only have a gross annual income of above Rs.1,500 a year. Among non-agricultural families the corresponding proportions are 32 per cent, 79 per cent and 21 per cent. Thus proportion of non-agricultural families with annual gross income less than Rs.750, is greater than the corresponding proportion of agricultural families. The petty traders, pariahs and other non-agricultural labourers who are necessarily very poor constitute this non-agricultural class. On the other hand proportion of non-agricultural families with annual gross income of more than Rs.750 exceeds the corresponding proportion for agricultural families. These non-agricultural families comprise of a good number of business men, contractors, etc., who are comparatively a bit well off than the agriculturists.

In Project area proportion of agricultural families and non-agricultural families with annual gross income of less than Rs.750 is 36 per cent and 29 per cent respectively as against 49 per cent and 32 per cent of their respective counterpart in Border area. Proportions of families with gross income below Rs.1,500 a year is 84 per cent and 64 per cent indicating that proportions of agricultural as well as non-agricultural families with income above Rs.1,500 a year are greater than their corresponding counterparts in Border area.

In general area villages it is significant to note that proportion of agricultural families with gross annual income of over Rs.1,500 is negligible (·61 per cent) while those under Rs.750 and Rs.1,500 are 45 per cent and 95 per cent respectively.

Table below further reveals that 38 per cent of the gross income in the Border area, 34 per cent in the Project area and 30 per cent in the General area is earned by families in the income group less Rs.1,500 constituting as much as 85 per cent of the total number of families in the respective areas.

TABLE G-2

Percentage distribution of income and families in different income groups

Annual income group (Rs.) (1)	Border area: Families (2)	Border area: Income earned (3)	Project area: Families (4)	Project area: Income earned (5)	General area: Families (6)	General area: Income earned (7)
1. Less than 1,500	84.5	38.4	83.5	33.8	95.00	95.0
2. 1,500 to less than 3,000	10.5	19.2	14.1	22.6	5.0	5.0
3. 3,000 to less than 4,500	2.1	6.7	1.9	5.0	..	..
4. 4,500 and above	3.0	35.7	0.7	38.6	..	..
Total ..	100.0	100.0	100.0	100.0	100.0	100.0

19: Assam G-5 (1956) 1953 A37 Sheet A37

[illegible] Considering all the families together if we classify the families with gross annual income below Rs.750 as low income group, those between Rs.750 to less than 1,500 as medium income group and those above Rs.1,500 as high income group, we get the following proportion of families in different areas :—

	Low income group	Medium income group	High income group	Total
(1)	(2)	(3)	(4)	(5)
Border area	[illegible]	[illegible]	[illegible]	[illegible]
Project area	[illegible]	[illegible]	[illegible]	[illegible]
General area	[illegible]	[illegible]	[illegible]	[illegible]

Thus we see that majority of the families are underprivileged, towards the medium income group in Project area and General area, while proportion of medium income group families is least in Border area. Proportion of low-income group families is least in Project area and highest in Border area closely followed by General area. Thus it appears that Project area villages enjoy a comparatively better economy than Border area and General area villages.

9.8 The greater bulk of the agricultural families income is derived from sale of agricultural produce. Most of them supplement their income through non-agricultural labour while others do it through Cottage Industries, trade, etc. The Non-agricultural families derived their total income from non-agricultural enterprises. The following table shows the contribution of different components to the average annual gross income of families.

TABLE G-5

Components of average annual gross income per family

Source of income	Agricultural families				Non-agricultural families				All families

592

From the above table it is seen that average annual gross income of predominantly agricultural families in Border area, Project area and General area are respectively Rs. 1,035, Rs. 1,095 and Rs.874. Apparently it appears that people in the General area are poorer than those in Border area. This however cannot be said to be true, for, from a consideration of the distribution of families in table G-1 it will be seen that average income figures for Border area and Project area are in fact inflated due to existence of a number of families in higher income group.

To the income of families in Border area agriculture and Animal husbandry contribute 58 per cent followed by Labour-service-profession which contribute 34 per cent (Labour includes agricultural labour also). Miscellaneous sources such as charity remittance, loan realised, etc., contribute 1 per cent. Others in order of importance are liquidation of assets, non-agricultural enterprises such as Trade, Cottage Industries, etc., which respectively account for 4 per cent, 3 ~~and~~ per cent only.

In project area main contributors are agriculture and Animal husbandry and Labour-service, profession etc.. accounting for 48 per cent and 36 per cent respectively followed by Liquidation of assets, and non-agricultural pursuits such as trade and cottage industries which respectively contribute 8 per cent and 5 per cent of the families total gross income.

Main contributors to family income in General area are in order of importance agriculture, Labour-service, profession, etc.. non-agricultural enterprise, and Liquidation of assets, which respectively accounts for 53 per cent, 36 per cent, 6 per cent, and 4 per cent of the families total gross income.

It is also seen that of the total average income of families, value of items produced at farm or at home and consumed at home account for 16 per cent of the families total annual gross income in Border area, 27 per cent in Project area and 35 per cent in General area. Thus average annual cash receipt of an agricultural family in the three areas comes to 84 per cent, 73 per cent and 65 per cent respectively, of the families average gross annual income, *i. e.*, Rs.1,035·06, Rs.1,095·33 and Rs. 873·98 respectively.

Components of average annual net income per family

(in 0·00 rupees

9.4 Considering non-agricultural families it is seen that average gross annual income per family in Border area, Project area and General area are respectively Rs.1,161·91, Rs. 1,644·36 and Rs.873·98 respectively. The main contributor to this income in Border area is Trade followed by Service, Profession, Labour and Agriculture and Animal husbandry, those in Project area are Labour-Service-Profession followed by Trade, small scale manufacture and agriculture and Animal husbandry. The comparatively higher average income from small scale manufacture and handicraft is due to existence of quite a good number of liquor distillers with quite a large amount of annual income. Main contributors to gross annual income of non-agricultural families in General area in order of importance are agriculture and animal husbandry, service-profession and labour. It is significant that among the non-agricultural families also agriculture and animal husbandry emerge to be the biggest contributor. This is due to the fact that in General area villages there are a large number of Nepali families whose principal occupation is cattle rearing and earned enough by selling milk, ghee, and livestock. These families were classed as non-agricultural families. 434 592 [563]

9.5 Of the gross income, agriculturists spend a portion in their farms on items such as purchase of seed, manure, etc., cost of maintenance of livestock, wages and salaries for labourers, and transport of produce while other spend a portion on running their household enterprises such as purchase of merchandise for trading, purchase of plants and machinery and raw materials for household enterprises, wages and salaries for employees, etc. The net annual income per family, as will be evident from table G-4, comes to Rs. 852·86 in Border area, Rs. 988·84 in Project area and Rs.749·51 in General area. The corresponding figures for agricultural families being Rs. 889·80, Rs. 930·70 Rs. 758·42 and for non-agricultural families Rs. 776·14, Rs.1,168·80 and Rs. 672·16 respectively. 511

The following table shows the annual expenditure of families in running their enterprises.

TABLE G-5

Current expenditure of enterprise

511

9.5 The following table analyses the changes occurring in the structure and volume of capital assets of the predominantly agricultural families as a result of the purchase and sale of the assets and liabilities during the period of a year—

TABLE G-6

	Gross investment			Disinvestment			Capital formation (+) or reduction (−)	
	Assets	Repayment of debt	Total	Assets	Borrowing	Total	—	Average per family
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
1. Border area	[illegible]	2185	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. Project area	28135	5049	43185	18146	47075	[illegible]	[illegible]	[illegible]
3. General area	7600	949	8548	1700	6895	13127	[illegible]	[illegible]

Gross investment made by the families stands at Rs.(1),[illegible], *i. e.*, Rs.40·0 per family in Border area, Rs.45,183, *i. e.*, Rs.66·7 per family in Project area and Rs.2,318, *i. e.*, Rs.45·8 per family in General area. It will be seen that in all the three areas the major portion of this investment is from equitting of assets. 511 426

Dis-investment consisting of borrowing and liquidation of assets amounts to Rs.[illegible],444, *i. e.*, Rs.[illegible]·1 per family in Border areas, Rs.66,045., *i. e.*, Rs.108·1 per family in Project area and Rs.12,627, *i. e.*, Rs.60·6 per family in General area.

Thus in all the three dis-investment far outweights investment with the result that a family in Border, Project and General areas, on an average disinvests a sum of Rs.25·0, Rs.35·4 and Rs.22·1 respectively. This net dis-investment arises largely, as is clear from table above, from the heavy rise in indebtedness among the families. Actually considering changes in assets alone there is a net increase of Rs.12.1 per family in Border area, Rs.30·9 in Project area and Rs.10.9 in General area. But these increases are more than multiplied by average per family increase in indebtedness of Rs.41·1, Rs.66·2 and Rs.32·1 respectively in the three areas.

9·6 Investment in assets by various items are shown in the following table.

TABLE G-7

Investment in Assets

Items	Border area: No. of families investing items	Border area: Average value of assets acquired: per family (Rs.)	Project area: No. of families investing items	Project area: Average value of assets acquired: per family (Rs.)	General area: No. of families investing items	General area: Average value of assets acquired: per family (Rs.)
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Land	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. Agricultural assets :—						
(a) Livestock	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
(b) Implements and equipments	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
(c) Others—						
3. Building	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
4. Furniture & fans	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
5. Plows & machineries prob. etc. for household enterprises	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
6. Others	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

Thus it is seen that proportion of families purchasing livestock is highest in all the three areas, followed by that purchasing agricultural tools, implements. Considering investment by items, building is conspicuous in all the three areas, contributing largely towards a net investment in assets in all the three areas. Others of importance are land and agricultural assets.

9.7. **Consumption expenditure of the family.**— The following tables show the broad pattern of the average family consumption expenditure in the three village-groups. The component of annual expenditure on food, clothing and other items of consumption which determine the standard of living of the rural families are displayed separately.

Size of average family—In Border area 5.5 members,
Project area 6.0 members and
General area 4.9 members.

TABLE G-6

Household Consumption Expenditure

Item	Baseline area				Project area				Control area

511 It is seen that the per family average annual expenditure is Rs.909·00 nP. in Border areas, Rs.1008·00 nP. in Project area and Rs.828·00 nP. in General area. The per family annual net income in the respective area being Rs.852·86 nP., Rs.988·84 nP, and Rs.949·51 nP. it follows that the budget of the average family is deficit in all the areas. [426] This deficit is usually made up either by restricting the consumption expenditure during the lean months of the agricultural year or by taking loans.

221 511 The field work of the survey was started during the month of February, *i.e.*, hardly after two months, of harvesting of winter paddy and during the harvesting period of cash crops like orange, betelnut, potatoes, etc. During this period people get money through the sale proceeds and naturally they [114] were tempted to spend comparatively higher amount on food. In fact, it was made clear during investigation that as lean months are approaching when people did not have money to purchase food articles, they used to lead a very austere life. This period is particularly very hard for the Border people because unlike people of other two areas they do not have [128] even paddy in store. As the above figures of annual expenditure of a [125] family were calculated on the basis of information collected for one month preceeding the date of investigation, in respect of food and non-food articles, and for one year in respect of miscellaneous items, there is every likelihood of the average per family expenditure on food and non-food articles being over-estimated.

128 511 As in the case of income, consumption of articles produced at home or at farm as well as those received out of the goods, services and gift and loan were valued in money terms on the basis of the local average retail prices in respect of the commodities concerned. Thus even firewood and other wild vegetables and fishes obtained by fishing were valued in terms of money. Of the total average expenditure on food, the food articles obtained in kind and consumed at home account for about 18 per cent in Border area, 53 per cent in Project area and 57 per cent in General area. Thus the share of food articles obtained in kind and consumed at home to the annual expenditure of a family is very low in Border area. This is natural because they depend almost exclusively on cash crop cultivation.

511 Out of the total expenditure, food account for about 68 per cent in Border area, 67 per cent in Project area and 73 per cent in General area. In all the areas cereals alone took the bulk of the expenditure on food, *i.e.*, 66 per cent, 75 per cent and 81 per cent in the respective areas

It is seen that expenditure on pulses, vegetables and milk are very low. In fact only a few of the Tribal villagers take pulses, milk and vegetables. Rice and fish or meat are the only items of the dishes of most of the villages.

Among non-food articles fuel and light accounted for 6 per cent in Border area, 5 per cent in Project area, and 5 per cent in General area. Khasis are heavy chewers of betelnut and this accounted for 5 per cent of total annual expenditure in border area, 4 per cent in Project area and about 3 per cent in General area while tobacco and tea in tea-stall accounted for about 5 per cent, 4 per cent and 4 per cent respectively of the total annual expenditure in the three areas. Expenditure on liquor

varied between 1·06 per cent to 2·00 per cent in the three areas. It is very likely that this figure will be an under-estimate due to the fact that people addicted to it do not like to admit so. The existence of a large number of liscentiate liquor distilleries – numbering upto 5 in a single village, and the brisk trade in these distilleries bear testimony to the fact that a large share of family income is drained out through liquor. 511

Among miscellaneous items clothing and foot-wear accounted for nearly 4 per cent in Border area, 6 per cent in Project area and 5 per cent in General area. Next to it in importance is medicine and doctor which accounted for about 3 per cent of the total annual expenditure in all the three areas.

Generally speaking, the comparatively high percentage of expenditure on food and low percentages on other items like clothing, houses and its repair, education, etc., indicates a low standard of living of the rural families in general.

9.8. It may be of some interest to know how the families belonging to typical economic groups divide their incomes between their current living expenses and other outlays on goods and services. The picture of the family expenditure pattern is summarised in the following table. 434 592 511

454

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

It is noticed that food is the largest single item of expenditure a every income level demanding about two-thirds or more of the average over all expenditure. It is significant to note that money outlays on food increase markedly at successive income level. This wide range of expenditure is the result of very low standard of food consumption in the low income groups and also possibly of increasing number of members per family in the higher income groups.

One striking feature revealed by the summary table of family income and expenditure given above is the average net deficit shown by the families of almost each income-group, except perhaps marginal surplus in respect of a few income-groups in the higher level. Thus for majority of the families the entire family income was not adequate on the average to meet current outlays on food and other necessities and comforts of daily living. Even the advantage of comparatively large average income was more than balanced by the larger differential increase in the family exp nditure due either to their larger family size or comparatively higher standard of living or both.

CHAPTER—X

Summary of main findings

125 10.1. Twenty-eight villages were selected for the purpose of the survey. Out of the 28 villages selected, 10 from Border area and 8 from Project area were selected purposively while the remaining 10 were selected at random from the entire district which is referred hereafter as general area.

166 Migration from big villages was rare but some migration was reported in respect of small villages.

164 293 871 489 482 Occurrence of Malaria, influenza and dysentery is a regular phenomenon in the area. Medical facilities were not found satisfactory and as much as 78 per cent of the villages have no dispensary within a radius of five miles. In regard to education, the facilities cannot also be said to be unsatisfactory for more than 60 per cent of the villages have a Lower Primary School. Transport facilities were not satisfactory and as much as 85 per cent of the villages still depend upon primitive mode of transport, namely head load. Correlated with outmoded form of transport, is the prevalence of unduly high cost of transport.

*162 161 10.2. The number of the families covered by the survey was 1006 in the Border area, and 647 in the Project area and 186 in the General area. The average size of a village in the respective area is 100·6, 80·9 and 18·6 families. In the Border and Project areas females out number males being respectively 1076 and 1092 females per 1,000 males as against 940 females per 1,000 males in the general area. 212 Literacy is as high as 34 per cent in the border area and 31 per cent in the Project area but as low as 17 per cent in the general area. [562] In all the areas literacy among females is very low.

*162 464 The working population (earners and earning dependents) is as high as 55 per cent in the Border area, 54 per cent in the Project area and 63 per cent in the general area. While there were no cases of unemployment in the Project and General areas, 53 persons were reported unemployed from border area.

241 *162 463 10.3. 51 per cent of the families in Border area are wholly agricultural, 35 per cent partly agricultural and 14 per cent independent of agriculture. The corresponding figures for the Project area are 61, 31 and 8 per cent respectively while for the General area they are 70 per cent, 29 per cent, 1 per cent respectively.

Predominantly agricultural families constitute 67, 76 and 90 per cent of the families in Border, Project and General areas respectively.

*162 423 10.4. 31 per cent of the families in Border area, 29 per cent in Project area and 10 per cent in General area were absolutely without any land while 35 per cent, 39 per cent and 24 per cent of the families in the respective areas possessed small holding ranging from 0·24 to 2·50 acres representing 11, 24 and 26 per cent of the total holding area in the respective areas. 26 per cent of the families in Border and Project areas and 41 in General area possessed medium sized holding (2 to less than 10 acres)

accounting for 42, 54 and 58 per cent of the total holding area in the respective areas. Large holding (10 acres and above) covering 44, 22 and 14 per cent of the total holding area in the Border, Project and General areas respectively were possessed by 16, 7 and 3 per cent of the families of the respective areas. 162 423

The average size of family holding worked out at 7.7 acres for Border area, 4·1 acres for Project area and 3·7 acres for the General area. The average size of cultivated holding per family in the three areas was found to be 5·1, 3·4 and 3·2 acres respectively.

10.5. The total number of farms in Border area, Project area and General area were respectively 759, 611 and 171 covering respectively 3914·18 acres, 1808·79 acres, and 373·81 acres, bringing the average size of farms to 5·16 acres in Border area, 3·64 acres in Project area and 2·20 acres in General area. 241 311 423

Percentage distribution of these farms and farm area by different size group is depicted in the following table.

ch/1
2/1
423

Size of Farm Family	Border Area			Dwipar Area			Central Area		
	P. C. Farm Family	P. C. of Farm (Acres)	Average Size (Acres)	P. C. of Farm	P. C. of Farm	Average Size (Acres)	P. C. of Farm	P. C. of Farm	Average Size (Acres)
1	2	3	4	5	6	7	8	9	10
1. Small Farms (Less than 5 Acres).	[illegible]	[illegible]	1.33	[illegible]	[illegible]	1.56	[illegible]	[illegible]	1.44
2. Medium Farms 5 to less than 20 acres.	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3. Large Farms (above 20 acres).	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Total	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

10.6. Of the total of 799 farms in Border area, 78 per cent were wholly owned, 17 per cent were wholly rented and the remaining 5 per cent were partly owned and partly rented. In Project area, proportions of wholly owned, wholly rented and partly owned and partly rented farms were found to be 73 per cent, 11 per cent and 16 per cent respectively while those in General area were respectively 84 per cent, 4 per cent and 12 per cent of the total number of farms. Of the total farm area, owned area accounted for in Border area 83 per cent, in Project area, 86 per cent and in General area 91 per cent of the total farm area in the respective area. Of the total owned area, nearly 80 per cent in Border area, 88 per cent in Project area and 94 per cent in General area were owned by wholly owned farms and the rest by partly owned farms. Of the total rented area, in Border area, Project area and General area respectively 91 per cent, 40 per cent and 51 per cent are covered by wholly rented farms.

10.7. Out of 1066 families in Border area, 436, i.e. 40 per cent were indebted, average debt per family being Rs.157·94 nP, and that per indebted family being Rs.351·95 nP. In Project area out of 1017 families 332, i.e., 30 per cent were indebted, average debt per family being Rs. 130·11 nP, and that per indebted family Rs.372·00 nP. In General area out of 186 families, 52, i.e. 28 per cent were indebted, average debt per family being Rs. 50·00 nP, and that per indebted family being Rs. 180·00 nP, of the total indebted families. Predominantly agricultural families constituted the highest proportion in all the three areas, being 98 per cent in Border area, 77 per cent in Project area and 98 per cent in General area accounting respectively for 97 per cent, 78 per cent and 99 per cent of the total amount of debt in the three areas. Majority of the loans were of small amount numerically in Border area 90 per cent of the loans are of size less than Rs.500·00, average size of these loans being only Rs. 69·71 nP. In Project area 71 per cent and in General area 72 per cent of the loans are of size less than Rs. 200.00, average size of these loans being respectively Rs. 44·69 and Rs. 89·89 only. Of the total number of loans 67 per cent in Border area, 81 per cent in Project area and 90 per cent in General area were of less than 3 years standing. Majority of the loans in Border and Project areas were found to be incurred for productive purposes. In General area 33 per cent of the loans were contracted for maintenance of the family.

Government and other professional and semi-professional money lenders emerged out to be the predominant sources of rural credit. In Border area loans from Government constituted 61 per cent of the total number of loans accounting for 53 per cent of the total amount of loans followed by those from money lenders which worked out to 55 per cent of the total number of loans accounting for 41 per cent of the total amount of loan. In Project area and General area respectively 60 per cent and 75 per cent of the total number of loans accounting for 70 per cent and 84 per cent of the total amount of loan in the respective area were contracted from private money lenders, while Government loans constituted in Project area 40 per cent and, in General area 17 per cent of the total number of loans accounting respectively for 30 per cent and 41 per cent of the total amount of loans in the respective area.

[illegible] Of the total number of farms [illegible] per cent in Border area, [illegible] per cent in Project area and [illegible] per cent in General area were less of income while one of income for [illegible] per cent, [illegible] per cent and [illegible] per cent respectively of the farms in the three areas were found to be [illegible] per cent or more per annum which in some cases rose [illegible] per cent.

[illegible] 10.3. Farm output of [illegible] per cent of the families in Border area, [illegible] per cent of families in Project area and [illegible] per cent of families in General area were less than Rs. [illegible] a year, while [illegible] per cent, [illegible] per cent and [illegible] per cent of the families in the respective area earned more than Rs. [illegible] a year from their farms. Of the total number of farms yielding less than or Rs. [illegible] a year in Border area [illegible] per cent of them are medium sized farms, and [illegible] per cent large sized farms, the corresponding proportions for Project area and General area being [illegible] per cent, [illegible] per cent, [illegible] per cent and [illegible] per cent.

[illegible] 10.4. In Border area the most important crops are sorghum, bajra, pulses, and [illegible] which respectively accounted for [illegible] per cent, [illegible] per cent, [illegible] per cent and [illegible] per cent of the total harvested area. In Project area pulses and sorghum are the most important crop which accounted respectively for [illegible] per cent and [illegible] per cent of the total harvested area. The most important crops in the General area are pulses and gram which respectively accounted for [illegible] per cent and [illegible] per cent of the total harvested area.

On the basis of data collected for all the villages investigated average yield per acre, worked out as pulses [illegible] maunds, gram [illegible] maunds, sorghum [illegible] lacs ([illegible] maunds) and bajra [illegible] lacs ([illegible] maunds). These yield exhibited wide variation among the three areas.

[illegible] 10.11. Proportions of families with annual gross income of less than Rs. [illegible], Rs. [illegible] to less than Rs. [illegible], and above Rs. [illegible], were respectively found to be [illegible] per cent, [illegible] per cent and [illegible] per cent in Border area, [illegible] per cent, [illegible] per cent and [illegible] per cent in Project area and [illegible] per cent, [illegible] per cent and [illegible] per cent in General area. Average annual gross income per family worked out to Rs. [illegible] in Border area, Rs. [illegible] in Project area and Rs. [illegible] in General area which for predominantly agricultural and non-agricultural families respectively stood at Rs. [illegible] and Rs. [illegible] in Border area, [illegible] in General area, [illegible] and [illegible] respectively as family income were agriculture, service-profession-labour and trade accounting respectively for [illegible] per cent, [illegible] per cent and [illegible] per cent of the total average income in Border area, [illegible] per cent, [illegible] per cent and [illegible] per cent in Project area and [illegible] per cent, [illegible] per cent and [illegible] per cent in General area.

The net annual income per family in different income groups varied between Rs. [illegible] to [illegible] in Border area, between Rs. [illegible] to Rs. [illegible] in Project area and between Rs. [illegible] to Rs. [illegible] in General area. The average net of per family net annual income worked out to Rs. [illegible] in Border area, Rs. [illegible] in project area and Rs. [illegible] in General area and the same per capita at Rs. [illegible] in Border area, Rs. [illegible] in Project area and Rs. [illegible] in General area.

[illegible]

So all the three area investment in land capital was more than [illegible] followed by disinvestment with the result that a family in Border area, Project area and General area on an average respectively disinvested a sum of Rs. [illegible], Rs. [illegible] and Rs. [illegible] during the year under reference.

13.11 The average annual expenditure per family worked out as Rs. [illegible] for Border area, Rs. [illegible] in Project area and Rs. [illegible] in General area. All the three areas thus have a deficit family budget.

Out of the total expenditure of the Border village family 67.8 per cent was incurred on food, 5.1 on clothing, 6.7 per cent on fuel and lighting, 6.8 per cent on tea, tobacco and drugs and 3.5 per cent on medical expenses. The corresponding proportions for project area being respectively [illegible] per cent, 5.1 per cent, 6.8 per cent, 4.8 per cent, and 3.3 per cent and for General area respectively 72.5 per cent, 5.2 per cent, 6.9 per cent, 5.9 per cent and 3.3 per cent of the total average expenditure, within the [illegible] in kind and consumed at home accounted for [illegible] per cent in Border area, [illegible] per cent in Project area and [illegible] per cent in General area.

APPENDIX

Population and Occupation

Total	[illegible]	[illegible]	[illegible]	[illegible]	

N. B.—1961 census population figures are not shown against Bardar Area and Pirgar Area villages. This is because of the fact that in most cases in the Census report, the different hlaqas of a village have been enumerated as different villages, e.g., the village Sabkha has been enumerated in 1961 census as three villages, viz., Sabkha Pakung, Sabkha [illegible], etc., while in some other cases, only one population figure has been recorded against a number of villages of which, mostly one is the main village, others being its satellites and as these villages were selected without any reference to the Census Handbook, there is every likelihood of our selected villages not coinciding with Census villages. So far as migration is concerned, it is very rare in big villages, particularly when they have been settled long ago but it was found through investigation that in some of the border villages due to continued adversities in their agricultural and other occupations people had to move away in search of work. Migration of some families was reported from Bhutani and Lyakhar. Some Khost families were reported to have migrated to Peshawar where they had got settlement land. However, information of this type was lacking, received from Sabkha, a village in Lakai near Sangung Sharang, M. P. C. D. Block, but land of near the Sabkha Bandar, where about one third of the total population was said to have migrated to Peshawar, Jaji Agencies, from Mandak are at the village. A study of population variation in Central area villages given above, will show that there is a net decrease of [illegible] persons in the sample villages from total number of persons recorded in 1961 Census. This is accounted for by migration of people which is considerable in smaller villages particularly those depending on shifting cultivation. A few families from Mandrang are said to have migrated to Khurram a village only a few miles away from Mandrang. Migration was also reported from Lamyaling, Dawran, Asda, and Jawa from Sighala and Mandrakhel a few families were said to have left the village a few days ahead of the date of investigation for their cultivation at some distant place.

TABLE C.5. 1

Distribution of population by Age-Group

Age-group	Sadiya Area (No. of persons)			Pasighat Area (No. of persons)			General Area (No. of persons)			Remarks

STATISTICAL ACCOUNT

OF THE

KHASI AND JAINTIA HILLS.

THE DISTRICT OF THE KHASI AND JAINTIA HILLS, called by the inhabitants Ka Ri Khási and Ka Ri Synteng, is situated between 26° 9′ 30″ and 25° 8′ 28″ north latitude, and between 91° 9′ 0″ and 92° 51′ 30″ east longitude. It contains an approximate area of 6157 square miles, and a population, according to the Census of 1872, of 141,838 souls. The principal town and Civil Station, which is also the headquarters of the Chief Commissioner of Assam, is Shillong, situated in 25° 32′ 39″ north latitude and 91° 55′ 32″ east longitude. 131 [101] [161] [632] [648]

BOUNDARIES.—The Khási and Jáintiá Hills District is bounded on the north by the Districts of Kámrúp and Nowgong; on the east by Northern Cáchár, the Nágá Hills District, and the Kapili river; on the south by Sylhet District; and on the west by the Gáro Hills.

JURISDICTION.—The Khási and Jáintiá Hills constitute a Political District, removed from the jurisdiction of the ordinary Criminal, Civil, and Revenue Courts, and of the offices established under the General Regulations and Acts. The administration of the country is vested in the Chief Commissioner of Assam, the Deputy-Commissioner of the Khási and Jáintiá Hills and his Assistants, and the native Chiefs, who are variously styled Siems, Wáhadádárs, Sardárs, Dollois, Pathors, and Lyngdohs. Siem, or more properly Seim, is derived from the Khási word for 'soul, life;' Wáhadádár, from the Hindu term *uhdádár*, meaning an 'officer;' Lyngdoh strictly means a 'sacrificial soothsayer,' from the Khási *ong*, 'to speak,' and *doh*, 'flesh.' The District is divided into three portions, —namely, British possessions in the Khási Hills; petty dependent 648 631

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

648 631 States in the Khásí Hills; and the Jáintiá Hill country, which is wholly British. The British possessions are administered under a code specially introduced for the purpose. The Khásí dependent States consist of petty democracies, presided over by chiefs called Siems, who, though taken from one family, are appointed by election; or by head-men, such as Wáhadádárs, Sardárs, and Lyngdohs, whose offices are absolutely elective. The appointment of all these chiefs and head-men is subject to the confirmation of the British Government, which also reserves to itself the right to remove them in case of misconduct.

The British possessions in the Khásí and Jáintiá Hills, which cover an aggregate area of 2160 square miles, consist of the following Fiscal Divisions:—In the Khásí Hills—(1) Jim-mang; (2) Láit-lyn-kot; (3) Láit-kroh; (4) Bái-rang, otherwise Wáh-long; (5) Long-ká-ding; (6) Máo-be-lár-kár; (7) Máo-smái; (8) Mynteng; (9) Máo-mlúh; (10) Máo-puñ-kyr-tiang; (11) Nong-jírí; (12) Nong-lyng-kin; (13) Nong-bah; (14) Nong-riát; (15) Nong-kroh; (16) Nun-niah; (17) Rám-dáit; (18) Sáit-soh-pen; (19) Tyng-riang; (20) Tyng-rong; (21) Tyr-ná; (22) Um-niuh; (23) Mar-bisu (dependency); and (24) U Ttymá. In the Jáintiá Hills—(1) Am-wi; (2) Chap-duk (Kukí); (3) Dar-rang; (4) Jowái; (5) Lang-flút; (6) Lang-soh; (7) Lá-ká-dong; (8) Myn-riang (Mikír); (9) Mul-shoi (Kukí); (10) Más-kút; (11) Myn-sáo; (12) Nong-klih; (13) Nong-fúlút; (14) Nong-thá-long; (15) Nar-pú; (16) Nar-tiang; (17) Nong-bah; (18) Nong-jyngi; (19) Ral-liang; (20) Rym-bái; (21) Sái-pung (Kukí); (22) Soh-tyn-gah; (23) Shiliang-myn-tang; (24) Sáth-pathor; and (25) Shang-púng.

The Khásí democratic States, covering an aggregate area of 3997 square miles (in some reports stated at 4490 square miles), are as follow:—Presided over by Siems—(1) Bhawál, otherwise War-bah; (2) Cherrá; (3) Khyrim; (4) Lyng-kin; (5) Maláí-soh-mat; (6) Mahárám; (7) Máriao; (8) Máo-iong; (9) Máo-syn-rám; (10) Myl-liem; (11) Nong-soh-phoh; (12) Nong-klao; (13) Nongs-pung; (14) Nong-stain; and (15) Rám-brái. Presided over by Wáhadádárs—(1) The Confederacy of Shellá. Presided over by Sardárs—(1) Dwárá Nong-tyr-men; (2) Ji-rang; (3) Máolong; (4) Máo-don; and (5) Nong-long. Presided over by Lyngdohs—(1) Lyn-iong; (2) Máo-flang; (3) Nong-lywái; and (4) Soh-iong.

648 692 The administration in the Khásí States gives to the native Chiefs independent jurisdiction in all cases, civil or criminal (except

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

homicide), in which their own subjects are concerned. All cases of homicide, or matters involving disputes between people belonging to different States, are adjudicated upon by the British officers of the District. 648 692

In the British possessions, the principal sources of revenue are rents and royalties derived from mineral workings, such as lime and coal; rents of fisheries; and a house tax, which varies, according to situation and productiveness of the soil, from R. 1 to Rs. 2 or from 2s. to 4s. per house. A land tax is only levied in tracts where the Government possesses the actual proprietary right in the soil. Again, in the Khási States, the British Government, which undertakes the management of the natural products of the country, such as waste lands, coal, lime, etc., receives a half-share of the rents realized from these sources, the other half belonging to the native Chiefs. The other sources of revenue of the Chiefs are market dues, cesses levied occasionally for State purposes, and fines realized in the administration of justice. 648 651 [135]

HISTORY.—Our first knowledge of the Khási Hills dates from the time when the East India Company acquired the *diwání* of Bengal in 1765. The adjoining District of Sylhet was included in that grant; but as the hillmen had never acknowledged any subjection to the Muhammadans, so they still remained absolutely independent of the British power. However, the necessities of commerce, arising from their monopoly of the lime quarries, from which Bengal has drawn its supply from time immemorial, soon attracted European enterprise to the country. As stated in the Appendix to the Statistical Account of Sylhet, the control of the profits of the lime trade formed in early times one of the most valuable advantages attaching to the position of the official in charge of that District. It does not appear that any European had been attracted to reside in the Hills before 1826. In that year the Rájá of Nongklao entered into an agreement with certain European British subjects to allow a road to be made across the Hills, to connect the Surmá valley with Assam Proper. These Europeans took up their residence at Nongklao. Misunderstandings unfortunately arose, and, partly by the misconduct of some of their Bengálí followers, the growing discontent and apprehension were fanned into a flame. On 4th April 1829 the Khásiás rose in arms and massacred Lieutenants Bedingfield and Burlton, together with some sepoys. This led to military operations on the part of the British Government, which 175 648 [135] [487]

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

175 continued through several cold seasons. The last of the Khási chiefs
648 did not tender his submission until 1833. In February 1835 Colonel Lister was appointed Political Agent in the Khási Hills, with his headquarters at Nongklao; and the command of the Sylhet Light Infantry battalion was also placed in his hands. The civil and military functions remained conjoined until 1854, when Mr. Hudson was deputed to Cherrá Púnjí, which had then become the administrative headquarters, with the title of Junior Assistant-Commissioner, shortly afterwards changed to the present one of Deputy-Commissioner.

The Jáintiá Hills came into British possession in 1835. In that year, as related in the Statistical Account of Sylhet District, the last Rájá of Jáintiá, Indra Singh, was deposed on the charge of complicity with certain of his tribesmen who had carried off three British subjects and barbarously immolated them at the shrine of Kálí. The portion of his territory that lay in the plains was forthwith annexed to the District of Sylhet; and the Rájá voluntarily resigned the hill portion, of which we also took possession. A pension of Rs. 500 a month, or £600 a year, was granted to the deposed Rájá for life, and he resided peaceably in Sylhet until
175 his death in 1861. When we first assumed the administration of
648 the Hills, no change was made in the indigenous revenue system,
651 which consisted simply of the payment of a he-goat once a year from each village. The Rájá had derived the greater portion of his income from his possessions in the plains. In 1860, however, a house tax was imposed, the highest limit of which was one rupee (2s.) per house. This measure of direct taxation was very obnoxious to the Syntengs. They formed irregular gatherings, at which they resolved to resist payment, or at least to refuse to pay except through their own hereditary Rájá, who was then alive. An outbreak took place in the early part of the year, but it was promptly suppressed; the people were disarmed, and matters went on much as usual. But the disarmament was imperfect, and it soon became evident that the Syntengs were profoundly disaffected to our rule. Towards the close of 1860 new taxation was introduced, in the form of judicial stamps; and the elaborate schedules of the new income tax were thrust into the hands of persons, few of whom could read the language in which they were framed. Imposts also were
175 introduced upon fisheries and the right to cut timber. Con-
764 siderable feeling had been excited by a sanitary prohibition against
648

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

burning the dead in the immediate neighbourhood of the village of Jowái. Suspicions of insurrection arose during the months of October and November 1861. In the beginning of January 1862 alarming reports were received from various quarters, and the first serious outbreak occurred on the 17th of that month. This was occasioned by the interference of a *dárogá*, or native police official, with a religious ceremony that took place at the village of Jalong. In such ceremonies dancing with arms is held essential; and the *dárogá* took upon himself to disarm the dancers. This was the signal for a general rising. The *thána* or police station at Jowái was burned to the ground; the garrison of sepoys was besieged, and all show of British authority was swept away throughout the Hills. The Syntengs fought bravely for their independence, and at first were successful in cutting off several small detachments of police and sepoys. Their weapons were bows and arrows. In common with the other hill tribes of the North-East Frontier, their chief defence consisted in a series of strong stockades, one behind another; and the paths leading to their villages were thickly planted with *pánjis*, or little bamboo spikes, stuck in the ground like caltrops. The battalion of sepoys stationed in the Hills was rendered inefficient by sickness. At last it was found necessary to move a regular army, including an elephant battery and two regiments of Sikhs, into the country in order to quell the revolt. Colonel Dunsford was in chief command. He was accompanied by Major Haughton, the Governor-General's Agent on the North-East Frontier, and Captain Morton, the Deputy-Commissioner of the Khási and Jaintiá Hills, who acted in a political capacity. The operations were tedious and harassing. The rebel chiefs were captured one by one, and the District was declared to be finally pacified in March 1863, after the rebellion had lasted for fifteen months. The special Commission appointed under Act xi. of 1857, for the trial of offenders in the Jaintiá Hills, was dissolved in December 1863. The causes of the rebellion were thus summed up by Major Haughton in an official despatch to the Government of Bengal:—'Taxation was introduced without the supervision with which such a measure should have been accompanied. It was followed up by fresh taxation and rumours of other taxes, also by fiscal and other innovations, which tended to disturb the minds of the people, without any counterpoise such as might have resulted from the continued presence of a European officer.' The Syntengs, like the

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

175 648 Khasis, have, ever since the measures of improvement which followed, remained peaceable and contented.

133 General Aspect of the District.—The District consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is steep, until a table-land is met with at an elevation of about 4000 feet. Higher up there is another plateau at Mão-flong, ten miles to the eastward of which, and in the same mountain range, the Civil Station of Shillong is situated at an elevation of 4500 feet above sea level. On the northern side of the hills are two plateaus, one between 1000 and 2000 feet below the level of Shillong, and the second lower down, about 500 feet above sea level. In general features all these plateaus are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where the hills have been denuded of forest, the country is covered with short grass, which becomes longer and more rank in the lower elevations. A remarkable feature in the aspect of the country throughout the hills is the numerous sacred groves which superstition has preserved from time immemorial from the destructive hand of the woodcutter. These sacred groves contain beautiful timber-trees of various kinds, rare orchids, rhododendrons, and wild cinnamon. On the more elevated table-lands, pine trees and stunted oak are met with; and in the lower hills, in every direction, are dense forests of the usual Indian trees, containing valuable timber.

137 [778]

134 135 The geological formation is mainly granite, with stratified rocks of sandstone, limestone, and shale. The coal-beds rest on trap and metamorphic rocks. The prevailing surface soil is a red homogeneous loam.

133 Mountains.—The principal mountain ranges and highest peaks in the Khási and Jaintia Hills are as follow:—(1) The Shillong range—height of principal peak, 6,445 feet above sea level. (2) Dingiai range—principal peak, 6,200 feet. (3) Mão-thad-rú-shiu range—highest peak, 6,137 feet. (4) Lão-syn-rú range—highest peak, 5,773 feet. (5) Lão-mão-dah range—highest peak, 5,577 feet. (6) Lão-ber-ah—highest peak, 5,400 feet. (7) Lão-bah range—highest peak, 4,464 feet. (8) Lyng-ker-dem range—highest peak, 5,000 feet. (9) Lão-luiong range—highest peak, 4,848 feet. (10) Mão-ryb-shu range—highest peak, 5,800 feet.

The principal mountains are:—(1) Ray-long—height, 5,850 feet.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

(2) Sak-pen-lyu-rong, literally "The Navel of the Sky." This is supposed by the Khasis to be the centre of the world, and to be the highest peak in the hills. Its real altitude, however, is only about [illegible] feet. (3) Syrwo—height, [illegible] feet. (4) Shillong—height, 6,[illegible] feet. (5) Dingiai—height, 6,[illegible] feet. (6) Kyi-lang mark, one huge mass of stone, about [illegible] feet high, and of a rounded form—height above sea level, 5,[illegible] feet. (7) Lôh-lôh—height, [illegible] feet. (8) Lôh-dwô—height, [illegible] feet. (9) Thang-ô-mîle—height, [illegible] feet. (10) Nong-jong—height, [illegible] feet. (11) U Mîle—height, [illegible] feet. (12) Mîle-lang—height, [illegible] feet. (13) Mîle-kô-long—height, [illegible] feet. (14) Mîle-ny-mul—height, [illegible] feet. (15) Syn-pen—height, [illegible] feet. (16) Mîle-ungi—height, [illegible] feet. (17) Lôh-mîle-kôn—height, [illegible] feet. (18) Nong-syn-rôh—height, [illegible] feet. (19) Mîle-kryh—height, [illegible] feet. (20) Nong-khrong—height, [illegible] feet. (21) Kôlô-long-ungôn—height, [illegible] feet. (22) Mîle-lôh-lôh—height, [illegible] feet. (23) Funtar-kyi-long—height, [illegible] feet.

The mountain peaks are of various forms and shapes, but generally conical, and capped by sacred groves. No roads exist to permit the ascent of carriages, but most of the hills can be ascended by beasts of burden, even without roads tracks. In the eastern portion of the District the hills are covered with forest.

133

491

137

RIVERS.—Six navigable rivers flow through the hills, the streams being all mountain torrents. On some of the large streams, however, near the point where they debouch upon the plains, small canoes are used for short distances below the rapids. The principal streams flowing south to the Surma river in Sylhet are the following:—(1) The Kyn-chi-ang, named Jâhâkâl by the Bengalis in the plains; (2) the Tangla, called Mokâi in the plains; (3) the Bograh, called Bogrâdai in the plains; (4) the Sak-ryng-kaw, called Dhalâi in the plains; (5) the Mawgâi, called Pûm in the plains; (6) the Mîle-ryh-du, called Kôni in the plains; and (7) the Lubâ or Lubâi. The principal tributaries to the Brahmaputra are:—(1) The Kapili; (2) the Umkhen, called Sanjâni in the plains; (3) the Umrôi; (4) the Umrem, called Digru in the plains; and (5) the Kaldôni, called Kalai in the plains. All the foregoing streams have numerous feeders of their own, but none of them are of any importance.

133

[501]

The Khâsi and Jaintia Hills are, like all mountainous countries, intensely wooded, and the streams run over rocky beds, some passing through cultivated lands. As they approach the plains,

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

133 they form rapids, the waters precipitating themselves down deep, rocky gorges and chasms, choked with huge boulders. Some of these gorges are very beautiful; the streams, being hemmed in between stupendous mountains and rocks covered with primeval forest, run in narrow but very deep channels swarming with fish. No islands or lakes are formed by any of the rivers, although several of them have large, deep pools. They are all unfordable during the rains.

312 Utilisation of the Water Supply.—None of the rivers are utilised as a motive power for turning machinery, although the streams on the higher plateaux might be easily turned to such an account. Their waters, however, are extensively used for the purposes of irrigation, and the hill people display great ingenuity in cutting channels or aqueducts for leading the water on to their fields. It is in this manner that the Civil Station of Shillong [365] receives its water supply. Aqueducts convey water to the houses of all the European residents; and branch channels from the main aqueduct flow through the *Aladr*, and along the streets occupied by the native inhabitants. No fishing towns exist in the hills; but [226] near where the rivers debouch upon the plain are some valuable [543] fisheries, which are annually let in farm, the lessees being generally Bengalis. These fisheries yield an annual Government revenue of about £300. Embankments in order to protect the land against floods do not exist. A few embankments, or rather dams, are thrown across narrow valleys between hills, so as to create reservoirs for water. At Shillong there are a few tanks thus formed, which are both useful and ornamental.

135 Minerals, etc.—Coal and limestone, both of excellent quality, are found in abundance. Lower Bengal obtains nearly the whole of its lime supply from the *Khásí* and *Jáintiá* Hills. The lime is known as 'Sylhet lime,' and is obtained by quarrying from the beds of stone which line the base of the mountains along the whole length of the Sylhet boundary. The supply is literally inexhaustible. Coal cut-crops at Chertá Pónji, Lákká-dong, Shellá, Mío-ryn-rim, and at several other places; but as a rule it is scattered, and found in places difficult of access. The coal, however, is of excellent quality, and leaves very little ash. Stone, well adapted for building purposes, is also found. Ironstone exists almost everywhere throughout the Hills, but principally in the dependent States of Khyrim, Nongpyung, Cherrá, and Mylliem. In former years the Khásís were

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

In former years the Khásiás were great iron-smelters, and enormous excavations in the most favourable localities for obtaining ironstone prove the extent to which this manufacture was carried on. In some places the whole surface of the ground appears to have been dug up for a depth of several feet, leaving huge boulders standing up here and there. Of late years, however, as the price of labour in the Hills has risen, the trade in iron has died away, and there is now little demand for the Khási article, the cheaper English metal having driven it out of the market. 178 316 325

NATURAL PHENOMENA.—Many peculiar caves and caverns are found in the limestone rock formation, the most notable being the caves at Cherrá Púnji and at Rúpnáth in Amwi. At the latter place the caverns extend a great distance beneath the earth, one being imagined by the people to reach as far as China, and a Hindu legend states that a Chinese army once marched by this route to the invasion of India. In another cave, the limestone stalactites have been carved into images representing the gods of the Hindu pantheon. On the banks of the Kapili river on the Cáchár border, at a place called Sumir, there is a hot spring, the water of which contains carbonate of lime. All the rivers in the Hills flow through gorges in certain parts of their course, the most picturesque being at Tehriá, where a small stream is compressed into deep pools among limestone rocks; and at Darrang and Borghát, where the Mangat and Mantideo rivers respectively debouch upon the plains. 133 [823]

FORESTS, ETC.—The India-rubber or caoutchouc tree is found in many forests throughout the Hills, but not in great numbers, and the supply and value of the gum has much decreased of late years. In 1870 the right of tapping the trees in the Jáintiá Hills was leased out for a sum of £36, 12s. 0d.; but by 1876 the trade had almost entirely ceased. There are some tracts of timber forest on the lower hills towards the Brahmaputra valley, but through the want of water carriage they are of no great value. Vigorous efforts are being made to preserve the forests in the higher plateaux. Owing to the habit of firing the jungle in spring prior to sowing, great waste of valuable timber has taken place; but since the country has been separated from Bengal and placed under the administration of the Chief Commissioner of Assam, attention has been given to the matter, and special areas are now being set apart for the preservation and growth of forest timber. Cinnamon grows wild in some parts of the country. There is a considerable trade carried on in 137 [314] 137 648 659 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

There is considerable trade carried on in
245 *tezpit* or bay leaves, the trees being extensively cultivated by the
439 inhabitants of the lower slopes of the hills on the Sylhet border. The finest oranges in India are also grown in groves in the same tract, the value of the trade in which is now (1876) estimated to amount
237 to £3760 per annum. Lac is gathered by the Míkirs in the Jáintiá
439 Hills, but not to any great extent. Bees are both domesticated and found wild, and an extensive trade in bees-wax is carried on,
231 the amount exported being estimated at from three hundred to four hundred *maunds* annually. The whole of the Hills, where there is
233 no forest, and where the land is not under cultivation, consists of
621 rich pasture grounds, which are held in common by the villagers
651 and pay no revenue to Government.

137 The forests of the Khásí and Jáintiá Hills do not yield much profit either to the British Government or to the chiefs. There
[648] are no reserved forests in the District; and according to the Deputy-Conservator, the total area of unreserved forest, *i.e.* of land covered
[659] with timber trees and not at present required for *júm* cultivation, is only 150 square miles. The trees found are chiefly pine, and those classified as 'mixed upper hill forests.' At an elevation of 3000 feet, the Pinus Kasia predominates over all other vegetation and forms almost pure pine forests. It is found also at lower heights, and there attains larger dimensions, but only in the case of isolated trees. The 'mixed upper hill forests' are confined to a series of sacred groves, which clothe the topmost ridge of the watershed between the valleys of the Brahmaputra and Surmá. The characteristic trees are those of a temperate vegetation, chiefly consisting of oaks, chestnuts, magnolia, Schima, Cinnamomum, Prunus, Engelhardtia, etc. There are also numerous other timber trees, including the valuable *sál* (Shorea robusta) and the rubber tree (Ficus elastica); but on the whole the Khásí Hills are remarkable for the
[648] absence of forest. Early in 1874-75 measures were taken to put a stop to the indiscriminate burning of the forests, and the Siems and
[659] village officers were made responsible for the conservancy of the sacred groves. These endeavours have met with some success; but it is a very difficult thing to change the habits of a population, or to induce uncivilised tribes to incur a small temporary inconvenience for the sake of future benefit. The total area directly protected from fire during the year 1875-76 is returned at 3618 acres; the expenditure was Rs. 122; and in ten prosecutions for breaches of forest rules, twenty-three persons were convicted.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

The forest administration of the British Government is confined to two plantations in the neighbourhood of Shillong, for which a rent is payable in perpetuity. One of these, on the farther side of the Umkra, was originally acquired in 1871-72 for the sake of experiments in arboriculture. The rent of Rs. 50, or £5, is paid by the Forest Department; the area had been at first estimated at 580 acres, but an actual survey undertaken in 1875-76 reduced this estimate to 262·59 acres. A considerable portion is covered with Pinus Kasia, which is carefully protected. Of the exotic trees tried on this plantation, only the three following can be said to have done well: Juglans regia, Eucalyptus rostrata, and Pinus maritima. All the rest either suffered from frost in the winter, or required far more nursing than can be afforded them in forest plantations. The young trees of the indigenous oak (Quercus serrata) were also attacked by rats, who bit off great numbers just above the ground. The Spanish chestnuts did not thrive, and were removed to the model farm for trial at a higher elevation. The second plantation, on the northern slopes of the range immediately behind the Station, consists of several patches of forest, which were acquired in connection with the scheme for providing Shillong with a permanent water supply. The total rent is Rs. 375, or £37, 10s., paid from Town Improvement Funds; and the aggregate area is estimated at 796 acres. All the fields within this area that had formerly been cultivated by the Khásiás—about 80 acres in all—were sown by the Forest Department with Pinus Kasia, Quercus Griffithii, Q. serrata, and Q. fenestrata, which have succeeded well; and about 8 acres were planted with different species of Eucalyptus. Up to the close of 1875-76 the sum expended on the first of these two plantations was Rs. 742. 9. 9, or £74, 5s. 3d., and on the second, Rs. 730. 9. 6, or £73, 1s. 2d.

A cinchona plantation was started in 1867 by the Superintendent of the Calcutta Botanical Gardens. It consists of twelve small patches of plants near Nongklao, and one near Jírang, situated at elevations varying from 3500 feet to 2000 feet. The species cultivated are Cinchona succirubra, C. officinalis, and C. micrantha. At first they were under the charge of two Khási gardeners, who each received Rs. 16 a month, or £19, 4s. a year, to weed them and keep fires out. In 1874-75 these plantations were taken charge of by the Forest Department, and specimens of the cinchona bark were submitted for analysis to the Government Quinologist

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

249 648 65

at Dárjiling, who reported unfavourably on them. They have since been made over to the Siem of Nongklao, who is responsible for their being kept clear of weeds and protected against fire. Up to the close of 1875–76 the total expenditure had been Rs. 672, or £67, 4s. 0d.

136 [224] [648] [165]

FERÆ NATURÆ.—Tigers, elephants, rhinoceros, buffaloes, *mithuns* or wild cows, bears, leopards, wolves, jackals, foxes, wild hog, and several kinds of deer abound in the Khásí and Jáintiá Hills. The expense of keeping down tigers in the shape of Government rewards amounted to £44, 10s. 0d. in 1869-70. The rate of reward now paid is Rs. 25 or £2, 10s. 0d. per head. No rewards have ever been given for the destruction of venomous serpents. The number of deaths from wild beasts and snake-bite reported to the police amounted to 28 in 1866-67, 18 in 1867-68, 16 in 1868-69, and 26 in 1869-70. The small game found in the Hills consists of black partridges, hill partridges, quails, ducks, teal, snipe, and woodcocks. The *mahsir* fish is caught in the rivers. No regular trade is carried on in the skins of wild animals; and, except in the case of wild elephants, the *feræ naturæ* are not made to contribute towards the wealth of the people.

226 439

224 648 651

ELEPHANTS.—Wild elephants are found in the lower ranges of the hills, and in the gorges opening on the valleys of the Surmá and the Brahmaputra. Each State in the Khásí Hills and each dolloiship in the Jáintiá Hills constitutes a separate hunting circle or *mahál*. In the Khásí States the conditions of elephant hunting are governed by rules framed in 1874-75 by the Chief Commissioner, and approved by the Government of India. These rules provide, (1) that the British Government will make no claim to royalty on account of elephants caught in the Khásí Hills; (2) that one half of the proceeds of the sale of each elephant caught shall be paid over to the chief whose State forms the *mahál*, and the other half retained by Government; (3) that if a chief wishes to hunt elephants on his own account, the *mahál* composed of his State shall be reserved from sale, and a special arrangement shall be made with him on the basis that half the proceeds of the hunting shall accrue to Government. A special form of hunting licence in accordance with these rules has been settled by the Chief Commissioner. In the Jáintiá Hills, as being British territory, the ordinary Assam rules are in force, in accordance with which leases of the *mahals* are sold at intervals of two years to the highest bidder at

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

public auction. The Assam rules, as revised in 1875-76, reserve to Government the right of pre-emption at the price of Rs. 600 (£60) in the case of every elephant captured between 6 feet and 7½ feet in height. For every elephant caught that is not purchased by Government, a royalty of Rs. 100 (£10) is payable within one month after capture. Certain methods of hunting are prohibited. 224 648 651

POPULATION.—Prior to 1872 no attempts had been made at a Census of the Khási and Jáintiá Hills, but in 1870 the Deputy-Commissioner approximately estimated the population at 118,925 souls. In 1872, at the time of the Bengal Census, operations were set on foot in these Hills, but on a less elaborate system than in Regulation Districts. In the Khási Hills, the Census of the various petty States was effected through the chiefs; in British territory in the Jáintiá Hills, the *dollois* conducted the enumeration; while at Shillong and other places under direct administration, the work was done by officers attached to the Deputy-Commissioner's office. The results are thus returned:—Adults—males, 39,882; and females, 44,298: total adults, 84,280. Children under twelve years of age—males, 28,611; and females, 28,947: total children, 57,558. Total males, 68,593; total females, 73,245. Grand total, 141,838; proportion of males, 48·36 per cent. The total area of the District, according to the latest returns, is 6157 square miles, which gives an average density of 23 persons per square mile. The number of villages is 1003; the number of houses, 30,557, of which 350 are returned as of the better sort. 648 659 161 161 162

ETHNICAL DIVISION OF THE PEOPLE.—The population consists almost exclusively of aboriginal tribes and races, viz. Khásiás and Syntengs (who form the bulk of the inhabitants of the Khási and Jáintiá Hills respectively), Mikirs, Gáros, and Kukis. The only other dwellers in the Hills are the European officials and military officers at Shillong and Cherrá Púnjí, with their native servants and followers, a few Bengálí officials, and the sepoys of a regiment of native infantry. The classification of the inhabitants according to religion shows:—141,283 aborigines; 365 Hindus; 62 Muhammadans; and 128 Christians, including 35 Europeans, 8 Eurasians, and 85 native converts. 563 162 [648] [779]

THE KHASIAS.—The following sketch of the physical characteristics and customs of the Khásiás has been kindly furnished to me by the Deputy-Commissioner, Colonel Bivar; it is reproduced almost verbatim from his report and on his authority:— 144

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

144 'ETHNOLOGY.—In order to determine the ethnological position of the Khásiás, we need dwell upon a few only of their physical characteristics, viz. those which are held to indicate that type of the human family, the Mongolian, to which they undoubtedly belong. A detailed description of their physiognomy would embrace forms and characters by no means common even to tribes occupying the hills in close proximity to them, much less referable to all branches of the Mongolian stock. These differences in detail, which may be attributed mainly to local influences, render it extremely difficult, if not absolutely impossible, to trace out the exact relation which these mountain tribes bear to each other. But the Mongolian, or, to use a more comprehensive term, the Turanian, physiognomy is unmistakeable in them all—Khásiás, Jáintiás, Gáros, Míkírs, Nágás, Manipuris, etc. The chief points may be briefly stated as follows:—
142 Colour tawny or yellow, though a darker hue is not entirely
[141] unknown; nose somewhat depressed, with a peculiar conformation
[302] towards the forehead at the glabellum, which is very flat and broad; face broad, flat, and squarish, with high and rounded cheek-bones; skull globular rather than square; eyes middle-sized and black, with a yellow tinge in the eyeball; eyelids obliquely set, but less acutely than in the Chinese and other Indo-Chinese races; mouth large, with prominent though not very thick lips; hair black, thick, and worn long, the orthodox style being to tie it up in a knot at the back, varying little with sex; beard remarkably sparse, but the
141 moustache more abundant than the beard. The lower classes go
[826] bare-headed; stature low in the majority of cases; constitution strong and robust; limbs thick, short, and stout; trunk long in proportion and very broad at the waist; calves over-developed, but this is considered an element of beauty, more especially in the women, who, on the average, are fairer and handsomer than the men; carriage ungraceful.

157 'SOCIAL AND MORAL QUALITIES.—Disposition very affable, gentle, and cheerful; rather industrious, but devoid of ingenuity and mechanical skill. In the industrial arts, such as masonry, carpentry,
291 and agriculture, they are amenable to training. Dress amongst the lower classes is confined to a fringed jacket rudely woven of hemp, extending down as far as the thighs, and leaving the arms bare, together with a scanty covering for the loins. The more respectable classes wear a turban of coarse cotton or silk for a head-dress, and a sheet of silk thrown loosely over the shoulders, together with a long

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

strip of fine silk for the loins, a part of which hangs gracefully as low as the calves in front. No notice is here taken of what has undoubtedly been added and borrowed from their more civilised neighbours in the plains. 291

'MARRIAGE.—The marriageable age for females is from 15 to 18; for males, from 18 to 24. Matrimonial alliances are contracted either through the parents or the living representatives of the families to which the parties belong. The mode of procedure is still very primitive and unceremonious. The bridegroom, escorted by a number of friends and relatives, goes to the house of the bride, where all are feasted and lodged for the night; on the morrow he leads the bride, accompanied by a number of her relatives, to his own house, and entertains the company with dishes of boiled rice and fresh pork. After remaining there a day or two, the newly-married couple return together to the house of the wife, which becomes their future home. Marriage is dissoluble by regular divorce, for any sufficient cause, and often without any assignable reason except mutual dislike or want of issue, the latter being the most common case of all. Marriage with the Khásiás is simply a conventional arrangement, with nothing further for its object than the procreation of children; failing that, it is no longer looked upon as a contract permanently binding. Divorce is effected in the presence of eye-witnesses—the parents, or the heads of clans. Five cowries (*kauris*) are produced by the parties and exchanged, then cast away by mutual consent, and the ceremony is over. Parties once divorced can never again contract marriage with each other, but they are at liberty to marry into other families. Polygamy, strictly so called, is not sanctioned by Khási custom. Adultery is looked upon as a serious crime. If the five cowries have not been cast away by mutual consent, both husband and wife are held to be subject to the "matrimonial demon;" and even when either dies in wedlock, the survivor is not at liberty to contract a fresh alliance until he or she pays the family a sum of money as the means of removing the surviving party from subjection to the "matrimonial demon." The husband is a stranger, so to speak, in the family he has entered, and perpetuates the race of others, not his own. The children in all questions of lineage and personal rights follow the mother. There are always two interests in the same family—that of the husband, and that of the wife. Whatever the husband may have earned or acquired in

58 591 586 [581] 587 595 837 587 593 611 593 428

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

593 wedlock goes to the wife and becomes her property; but all other
428 property is inalienable, and reverts to his family, as also does his corpse after death.

771 'RELIGION.—The religion of the Khásiás is demon-worship, or a jumble of enchantments muttered by priests who are sorcerers. They invoke evil spirits as the deputies of God and the instruments
775 of His pleasure or displeasure. The Khásiás believe in metempsychosis, or the transmigration of souls. After death, human beings are transformed into monkeys, crabs, tortoises, frogs, etc. Though a future state is not denied, it is treated with absolute indifference, as beyond the sphere of responsibility; all rites, ceremonies, and observances bear reference to the welfare of mankind in this world. The spirits of their departed relatives and ancestors are invoked only in so far as they are considered to influence and have power
764 over the present life. The Khásiás burn their dead, and collect the ashes into urns, which are kept under a slab raised on four others enclosing a space. These monuments are of various kinds and sizes —one for individuals, another for a family, and another for a whole
614 clan. There is no caste system, but each clan is called after some object of nature, as the Oak clan, the Crab clan, etc., and these names entail certain restrictions beyond which intermarriage is
771 forbidden. The Khási religion may be briefly described as the practice of forms to cure diseases, and to avert misfortunes of all kinds, by means of ascertaining the name of the demon who is the author of the evil, and the kind of sacrifice necessary to appease it.

797 'CHRISTIANITY.—The Welsh Mission has been labouring amongst the Khásiás and Syntengs for thirty-two years. The Christians number about 1000 [according to the Census of 1872, the total number of native converts in the District is only 85]. There are four central stations—Cherrá, Shellá, Shillong, and Jowái —and twenty-three churches. Translations of the whole of the New Testament, and a portion of the Old, are now (1876) going to press, besides other religious books.

197 'LANGUAGE.—The definitions generally given of monosyllabic languages are far from adequate to enable us to assign to the
193 Khási tongue its position amongst the Indo-Chinese family of speech. Still, in the absence of a better terminology, it may be described as monosyllabic in the agglutinative stage. The monosyllabic element greatly predominates. By far the larger number of the compounds are mere agglutinations (in a modified

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

sense) or juxtapositions of roots which have not thereby suffered 197
either obscuration or absorption—that is to say, they are all, 193
with a few exceptions, reducible to their constituent root words, which are still "current coin," and retain their power as independent vocables. The cases in which obscuration and "fusion" of roots have taken place are confined to—(1) the noun prefix *jong*, expressing abstract ideas; (2) the verbal prefixes *byn*, *kyn*, *lyn*, *ryn*, *syn*, *tyn*, *pyn*, *byr*, *kyr*, *lyr*, *pyr*, *syr*, *tyr*, expressing causation, intensification, and contrariety. The language is found purest at Cherrá Púnjí. The Khásiás have no written character or literature of 212
any kind of their own. Tradition says that all was lost while they 173
were yet masters of the plains, whence they were driven by a general catastrophe or deluge to their present fastnesses in the hills. The following works on the language have been published: *Khási Grammar*, *Anglo-Khási Dictionary*, *Khási Primer* (Parts I. and II., 113
with Vocabulary),—all issued by the Calcutta School-Book Society; *Khási English Dictionary* (in preparation), and an *Anglo-Khási First Book*.

'CUSTOMS REGARDING INHERITANCE.—A Khásiá, whether married 428
or single, if he makes his mother's house his home, is said to be earning for his *kur*, *i.e.* for his mother, or his brothers and sisters, or his mother's relatives. On his death his property goes to his mother, if living; if not, to the grandmother; if she is not living, then to his sisters; should his sisters also be dead, to his sisters' children. Should the deceased have left no sisters, the property goes to the brothers; should he have no brothers or should they be dead, the property descends to his aunts, or to their children if the aunts are not living; should the aunts have left no children, the property descends to the grandmother's or great-grandmother's sisters or children. The property of a female on her death goes to her mother, if the deceased have no children; or if the mother of the deceased is not living, the property goes to the brothers and sisters; if the sisters are dead, then their children become the heirs. If there are no such children, the property devolves as in the case of males. When a man is not living in his mother's house, but in that of his wife, he earns for his wife and children. On his death his property descends to his wife, with the exception of the ornaments and clothing worn by him during his lifetime, which go to the brothers and sisters or other relatives of the deceased. Should the deceased have been a widower, the property goes to his children, and in their absence

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

428 to the sisters of his wife, or to her nearest relatives if there are no sisters. The rank and titles of a deceased male descend to his brother; when no brother exists, then to the male children of his mother's sisters (maternal aunts); should the maternal aunts have no male children living at the time, then to the eldest male child of his sisters. When no relatives are to be found, the property of the deceased goes to the ruler of the country; or if a man dies leaving no relative other than wife and children, *i.e.* no relatives on the mother's side, the property in this case also goes to the ruler, who, as the wife and children cannot preserve the ashes of the deceased, takes charge of them, and for so doing takes all the property also. With regard to the inhabitants of the Lower Hills at Shellá, the custom as to succession is as follows:—Property belonging to a subject of Shellá is divided into two classes—(1) Property inherited from ancestors, which descends to the nearest of kin or to the relative of a deceased person who can perform his obsequies. (2) Property acquired during the lifetime of the holder, which is inherited by the children, whose duty it is to provide for the maintenance of their mother until she re-marries or dies.'

434 465 MATERIAL CONDITION OF THE PEOPLE.—The Khásiás and the Syntengs are as a people prosperous. Common labourers, if adult males, can earn wages as high as one shilling per diem, and adult 342 females as high as eightpence. The dwellings of the well-to-do classes are generally constructed of masonry, with thatched roof and 352 plank floor, and divided into two or three rooms. The furniture consists of a bedstead (*charpái*), a seat or two (*morá*), some cooking utensils, and a few boxes. The ordinary peasants and poorer 342 classes construct their huts of stone, mud, or plank walls, with a 184 thatch or cane roof. These are fitted with wooden platforms or loose planks placed on the ground to serve as beds. The food 262 of the well-to-do classes consists of rice, fish when obtainable, fowl 434 or meat, curry, vegetables, oil, hog's lard, fermented and spirituous liquor. It may be estimated that the living expenses of an average-sized household of this class would be about Rs. 25 or £2, 10s. a month, valuing the articles of consumption at *bázár* prices. An ordinary husbandman or labourer lives on rice, dry fish, occasionally a 276 little meat, oil, or hog's lard. *Pán* leaf, betel-nut, and lime are essential to the comfort of all the hill people, who are inveterate chewers of *pán*. They commence at an early age, and are rarely seen without a *pán* leaf in their mouths; the females are quite

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

disfigured from the practice. Adults will chew as many as four or five betel-nuts a day, with the usual accompaniment of *pán* leaves. The estimated cost of maintaining an average family of the labouring class is about Rs. 8 or 16s. a month. 276 [434]

TOWNS: SHILLONG.—There are no towns in the usual acceptance of the word; but the chief places in the Hills, looked upon by the inhabitants as cities, are Shillong, Jowái, Cherrá Púnji, and Shellá. According to the Census of 1872, Shillong had only 1363 inhabitants, Cherrá Púnji 443, and Jowái 4502. Jowái, however, is a collection of rural hamlets, and the population of Shillong has entirely altered since the date of the Census. The latter place first became the Civil Station in 1864, in substitution for Cherrá Púnji; and when Assam was erected into an independent Province in 1874, it was selected as the permanent seat of the Local Government. The Chief-Commissioner resides there, and also the heads of all departments in the Administration. The area of the Station is 7 miles in length by 1½ to 1¾ miles in breadth. A considerable native population is already settled, and is increasing from day to day. One of the largest weekly markets is held in the *bázár*; and with a view to facilitate access to the Station, which is the sanitarium for the Province of Assam, a cart road has recently been completed to Gauháti on the Brahmaputra, which will tend to make the place more and more important. An excellent water supply is introduced into Shillong through an aqueduct which has its source in the neighbouring hill streams, and sanitary measures are carefully enforced. Large sums of money have annually been expended on the erection of the public buildings necessary for the offices of the administration. A printing-press has been established, from which issue all the official documents and reports of the Province. The climate is excellent, the temperature being more equable than that of any other hill station in India, and therefore admirably suited to the constitution of Europeans. There is a church at Shillong, and a chaplain on the Bengal establishment officiates both there and at Gauháti. The cantonments were occupied in 1875 by the 43d Regiment of Assam Light Infantry, with three outposts. The strength was 9 European officers, 16 native commissioned officers, 80 non-commissioned officers, 772 fighting men, and 58 paid camp followers and non-combatants; grand total, 935. The total cost, including contingencies, was Rs. 189,190, or £18,919.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

361 In the interior of the Hills the largest villages are mere clusters of
463 huts. The great majority of the inhabitants are employed in agriculture, but there are no data upon which a proportion of agriculturists to non-agriculturists could be based.

167 There is no immigration into the District. Both the Khásiás and
178 the Syntengs have been successful in preserving to the present day their primitive isolation, free from the interference of Hinduism. They still maintain their aboriginal forms of belief and re-
[771] ligious worship, and repudiate alike the authority of Bráhmans and
[262] the entire system of caste. To some extent, however, they have given way to Hindu prejudices in the matter of purity of food. The
[563] few Hindus to be found in the Hills are temporary residents, engaged in civil and military employ, who always contemplate returning
[441] to their own homes. The traders are for the most part natives of the Hills; for the Márwárí merchants, who penetrate into every other corner of Assam, have been able to obtain no footing in the face of Khási competition. There is likewise no emigration from the District. The hillmen are a well-to-do and contented race, and either produce themselves or obtain by trade sufficient to satisfy
[166] their scanty wants. A certain number of both Khásiás and Syntengs proceed southwards every year to work on the tea gardens of Cáchár and Sylhet, but such absence from home is only temporary.

243 AGRICULTURE: RICE.—Thirteen different varieties of rice are cultivated in the District, of which the following is a list, giving the Khási name as well as the description of the grain:—(1) *U-kyba-khynriam* (*u*, the masculine article, meaning 'the,' and *kyba*, noun masculine, meaning 'paddy'), brown rice with long grain; (2) *u-kyba-khynriam bai-lih*, a white rice with long grain; (3) *u-kyba la-toh*, round-grained rice; (4) *u-kyba ksai*, bearded, husked; (5) *u-kyba-dew-ba-iong*, black husked rice (literally *u* = 'the,' *kyba* = 'paddy,' *dew* = 'earth,' *ba* = 'that,' *iong* = 'black'); (6) *u-kyba-ba-lih*, white rice; (7) *u-kyba-seim*, scented rice (literally *u* = 'the,' *kyba* = 'paddy,' *seim* = 'royal'); (8) *u-kyba la-kroh*, large-grained rice; (9) *u-kyba-ba-tlang*, small-grained rice; (10) *u-kyba sa-bia*, early rice; (11) *u-kyba ra-bon*, late rice; (12) *u-kyba tang-la*, rice grown along with beans; (13) *u-kyba-ba-túh*, small rice.

Rice is cultivated in marshy fields situated near running water as well as in high lands. The first seven of the above thirteen species of rice are sown in marshy lands during the months of April and May,

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

243

and reaped generally in November and December, although in some parts of the hills the harvesting season commences as early as October. The following is the mode of cultivation pursued. About the middle of February, the husbandman commences to prepare the land by bringing water to his fields from neighbouring streams by means of regularly-cut channels. His land is thus kept inundated for from fifteen to thirty days, in order to soften the soil, when part of the water is allowed to escape through openings made in the banks surrounding the field. The land is then ploughed, the ploughing being called *lur-snih*, and three or four days afterwards it is made to undergo a second ploughing, called *lur-kyn-rvi*. The fields are then refilled with water by the same means as before, and allowed to remain covered from ten to fifteen days, when the water is again drained off. After this the land is ploughed a third and a fourth time, the ploughings being termed *lur-shat* and *lur-ket* respectively, and the soil is made as smooth as possible with the hands or a hoe (*kedáli*). The seed is then scattered broadcast over the field. Transplanting is not practised in the District. When the plant has sprung up about six inches above the ground, water is introduced into the field a third time, and allowed to stand for about two months, when it is drawn off for a few days, in order that the land may be weeded. After weeding, water is again let in, and is not drained off till the crop is ripe for the sickle. The other six varieties are grown on high lands, the mode of cultivation adopted being as follows:—About the middle of September the grass on the ground to be cultivated is turned up with a little of the soil attached to the roots, and allowed to remain until about February, when the turf so dug up is collected into heaps and burnt. In March or April, according as the rains happen to be early or late, these heaps are broken up and scattered over the fields. The land is then ploughed twice, or merely dug up with a hoe, and the seed is then sown. After sowing, the plough or hoe is used to cover up the seed, which sprouts in about ten days. Showers of rain at short intervals are now looked for, but too much rain, or, on the other hand, a succession of dry days, would injure the crop. As the plant acquires strength, less anxiety is felt concerning the rainfall. About the middle of September the ears begin to appear, and in November the grain is reaped. This description of rice is never grown for more than two successive seasons on the same land. No improvement has taken place within the last twenty years in the quality of the rice grown in

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

243 the District, nor do any superior kinds of cereals appear to have been substituted for inferior ones.

THE DIFFERENT STAGES OF RICE CULTIVATION, in English and Khásí, are as follow:—The blade as it first shows, *spch-u-kyba;* the blade when well above the ground, *la-thylleng-u-kyba;* the ears when first formed, *lam-mat;* the ears beginning to ripen, *byr-tem;* the ripe ears, *la-hih;* unhusked rice, *u-kyba;* husked rice, *u-khaw;* cooked rice, *ka-ja.*

262 [435] [782] THE VARIOUS SOLID AND LIQUID PREPARATIONS made from rice are the following:—(1) *U-kypu*, cakes of different kinds, sold at six or twelve for a penny, according to size. (2) *U-shiní* or *gáh-khir*, prepared by the hillmen as an offering to their deity at the conclusion of the harvest. (3) *Kadam*, fermented rice water, sold at the rate of from three-farthings to threepence per quart, according to the strength of the liquor. (4) *Ka kiad-phatika* or *ka kiad-hárak*, a kind of spirits distilled from rice, and sold at from threepence to fourpence-halfpenny per quart.

273 435

243 OTHER CEREALS.—Indian corn, or *u-riu-ha-dem*, is grown on homestead lands. The ground is first manured, and the seed is sown about the middle of April. The crop is fit for cutting in September and October. A kind of millet seed called *u-kráti* is commonly sown with paddy on high lands. For want of more suitable land, however, this crop is often cultivated by itself on rocky slopes; and when this course is adopted, the jungle is first cut down in February and burnt. The seed is sown in April, and the crop gathered in December.

244 PULSES AND FIBRES.—Only two kinds of pulses are grown in the Hills, *u-rym-bai-ktung* and *u-rym-bai-jú*, both of which are varieties of beans. They are sown on high lands in March and April, and gathered in December. The only fibre is that made from the pine-apple stalk, which is largely used for making netted bags.

283

245 [439] MISCELLANEOUS CROPS.—(1) Oranges.—There are numerous orange plantations in the neighbourhood of Cherrá Púnjí, and the fruit is exported to all parts of Bengal. In the year 1876-77 the estimated exports were 9,400,000 in number, valued at Rs. 37,600, or £3760, at the rate of Rs. 12 or £1, 4s. per three thousand. These figures show a decrease in number as compared with the estimated export twenty years ago. The trees flower in March or April, and the fruit ripens in October and the following months. In some cases the oranges are allowed to remain on the trees till March, but

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

generally the gathering does not extend beyond January. As a rule, the cultivation is confined to the valleys and slopes on the southern face of the hills. (2) Pine-apples are also largely cultivated on the southern slopes, and grow to great perfection on the limestone formation. The fruit ripens in May or June, and is exported in considerable quantities. In 1876-77 the export of pine-apples was valued at Rs. 8000 or £800. (3) Potatoes are extensively grown on slopes of high land, and also in the low-lying fields where the land is well drained. The tuber was first introduced into the Hills in 1830 by Mr. Scott, who was then the Governor-General's Agent. The season for sowing commences about the middle of February when the rains set in early, and in April when they are late. The ground is dug up and carefully manured with burnt earth, and holes are dug about nine inches deep, and the same distance from each other. These holes are then partially filled in with loose earth, and a potato or two halves of one placed in each. They are then filled up with dry manure and soil. When the plant is fifteen or twenty days old, the ground about the roots is loosened and the plant earthed up, and the land is kept carefully weeded. In about four months after sowing, the crop is gathered. During the cold weather a second crop is raised, the seeds being planted in September and the tubers dug up in December. Potato cultivation has largely increased of late years in the District. In 1876-77 the exports were approximately estimated at 200,500 *maunds*, or 7480 tons, valued at Rs. 501,250 or £50,125, at the rate of Rs. 2. 8 per *maund*, or £7 per ton. (4) Sugar-cane is grown, but not to any great extent; cuttings are planted in March, and the cane ripens by November or December. (5) *Pán* is extensively cultivated, the runner being trained up trees standing in deep and shady valleys. Planting is carried on during the months of April and May, but the leaves are not fit to be gathered till the plant is two years old. (6) The *supári* or betel-nut (Areca catechu), called *u-kwai* by the Khásiás, is grown on the lower southern slopes of the hills, and, together with the *pán* leaf, is consumed in immoderate quantities by the inhabitants, who measure distance by the number of *páns* consumed on a journey. It is also exported to the plains. (7) *U-soh-phlang*, a root crop resembling a small turnip, is sown on high lands in April and gathered in September. It is a poor vegetable, but the natives of the Hills are fond of it, and eat it either raw or cooked. (8) Cotton is grown on high lands and

245 244 [439] [177] [439] 249 244 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

(8) Cotton is grown on high lands and
248 slopes; it is sown in April, and becomes fit for picking by January.

311 Area and Out-turn of Crops.—According to the Assam Ad-
241 ministration Report for 1875-76, the area of the British portion of the Khásí and Jáintiá Hills District amounts to 2160 square miles,
648 of which only 110 are under cultivation; of the remainder, 1337 square miles are set down as cultivable, and 713 as uncultivable. The total area of the semi-independent Khásí States is given as 3997 square miles, of which 176 are under cultivation, 2561 are cultivable, and 1260 uncultivable. In another portion of the same Report, the area under various crops throughout the entire District is thus approximately estimated:—Rice, 59,880 acres; other food grains, 57,820 acres; cotton, 1076 acres; potatoes, 33,880 acres. The average out-turn of rice per acre is returned at 8 *maunds*, or nearly 6 cwt.; of other food grains, 3 *maunds*, or over 2 cwt.; of cotton, 2 *maunds*, or 1½ cwt.; of
[435] potatoes, 55 *maunds*, or nearly 40 cwt. The price of rice in 1875-76 was Rs. 4 8 per *maund*, or 12s. 8d. a cwt., which gives Rs. 36 or £3, 12s. as the value of the rice crop obtained from one acre.

241 Condition of the Peasantry.—The Khásís can scarcely be considered an agricultural people, as they do not grow sufficient
423 grain for their own subsistence, and are dependent to a great
433 extent on imports of rice from the neighbouring Districts. Ten acres is generally considered a comfortable holding for a husbandman in the position of an ordinary Bengal peasant, but scarcely any man in the Hills depends entirely upon the produce of his land for
[231] his support. In the Jáintiá Hills a cultivator's position is con-
[554] sidered to be very low if he possesses no cattle, but performs all the operations of agriculture with his own hands. In that portion of the District, five acres is all that can be cultivated with a single
[465] pair of oxen, the average being four acres. A husbandman with a holding of five acres would not be so well off as a retail shopkeeper, nor would it enable him to live as comfortably as he could on a money wage of Rs. 8 or 16s. a month. The peasantry, however, as a class are not in debt. The land is owned chiefly by small proprietors, who occupy and cultivate their hereditary fields. The relations of landlord and tenant do not exist in the Hills, and no rent is payable to any one; consequently the principle of Act x. of 1859 (the Rent Law of Bengal) has no application.

231 The Animals used in agriculture are oxen; goats and pigs are
435

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

reared either for food or as articles of trade. A pair of ploughing oxen are worth about Rs. 32, or £3, 4s.; an ordinary cow, Rs. 12, or £1, 4s.; a score of kids six months old, Rs. 16, or £1, 12s.; and a score of full-grown pigs, from Rs. 100 to Rs. 160, or from £10 to £16. 231 435

THE AGRICULTURAL IMPLEMENTS in use in the District consist of a plough, called *ka jingkir* in Khásí, and a hoe or *kudáli*, called *u-mu-kkiu*. When the cultivation is carried on by means of oxen, the plough is used, the hoe alone being used when the land is cultivated by manual labour. In the Khásí Hills the use of the plough, except in a few rare cases, is entirely unknown; but in the *Jaintia* Hills, oxen and ploughs are used to a greater extent. What is technically termed 'a plough' of land is equivalent to four English acres; a pair of oxen, together with the necessary implements, would represent a capital of about Rs. 40, or £4. 241 407 [435]

WAGES.—The Deputy-Commissioner reports that the price of labour in the District has more than doubled in the last ten years. The rates obtaining at present are from eightpence to one shilling a day for an ordinary labourer, and from one shilling to eighteenpence a day for a porter. An agricultural day-labourer earns sixpence, and a woman at the same work fourpence-halfpenny a day. Bricklayers, carpenters, and blacksmiths earn from a shilling to eighteenpence a day. The new Station of Shillong, the present seat of the Local Government, was established in May 1864, and since that date the demand for labour has markedly increased. The extension of the cultivation of potatoes has also had an appreciable effect on the price of labour. 178 464 465 [244]

PRICES OF FOOD GRAINS.—Of the different descriptions of rice in the markets of the District, the better sorts are imported from the neighbouring Districts of Sylhet and Kámrúp. The local produce is considered fit only for the use of the Khásiás. The price of the better descriptions depends entirely upon the distance from which the supplies come. In a distant market like that of Shillong, rice of the best quality generally sells at from 6 to 7 *seers* for the rupee, or from 16s. to 18s. 8d. per cwt.; and rice of inferior quality, which is only used by the poorer classes, at from 9 to 10 *seers* for the rupee, or from 11s. 2d. to 12s. 3d. per cwt. Little or no trade is carried on in unhusked grain. Paddy produced in the District generally sells at an average of from 15 to 16 *seers* per rupee, or from 3s. to 3s. 6d. per cwt. Indian corn, which is only grown to a small extent, is sold 435 439 243

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

439 at the rate of two or three ears for a farthing; and sugar-cane, the
[243] cultivation of which is also very limited, at from a little over a farthing
273 to three-farthings per cane. A fermented liquor called *kadaw*, made
435 from rice, is sold at from three-farthings to threepence a quart, according to strength; and a distilled spirit called *phatika*, or *kalied-kiruk*, at from threepence to fourpence-halfpenny a quart. This latter description of liquor is sometimes made very strong. No records exist by which the present prices of the above articles can
[731] be compared with the rates ruling ten years ago. The maximum price of rice during the famine of 1866-67 was 5 *sers* 6 *chhatiks* for the rupee, or about £1 a hundredweight.

804 MEASURES, WEIGHTS, ETC.—The Hill people have no proper
805 measurement of time or distance. If there be any standard for measuring distance, it is by the number of *pâns* a man chews in the course of a journey, generally about one every half hour. In some parts of the District, land is measured by a stick called *ka diongsang*, varying in length from six to seven cubits. Liquids are measured in gourds of different measures, varying from half a *chhatik* to a *ser*, and also in bamboo tubes. Rice, potatoes, beans, etc. are measured in baskets, varying in size in different markets from two to eighty pounds.

805 In the Khâsi Hills the inhabitants reckon eight days in the week, named as follows:—(1) Lyn-kah; (2) Nong-krem; (3) Um-long; (4) Rung-hep; (5) Shillong; (6) Pom-tih; (7) Um-nih; (8) Yeo-duh. In the Jaintiâ Hills the eight days are named thus:—(1) Kylloo; (2) Pyn-sing; (3) Mâo-long; (4) Mâo-siang; (5) Mâo-shai; (6) Pyn-kat; (7) Thym-blein; (8) Ka-hat. The Khâsi months of the year, calculated by moons, are as follow:—(1) U Kylla lynkot; (2) U Rym-pang; (3) U Lyber; (4) U Laiong; (5) U Jimmang; (6) U Jillew; (7) U Nai-ting; (8) U Nai-lar; (9) U Nai-lûr; (10) U Rymew; (11) U Nai-wing; (12) U Nob-prah.

464 LANDLESS LABOURING CLASSES.—There is, and always has been,
423 a large class of labourers in the District who neither rent nor possess any land. Women and children are employed in manual out-door labour of all kinds.

423 VARIETIES OF LAND TENURE can hardly be said to exist. There is nothing whatever resembling the relations between landlord and
[427] tenant throughout the Khâsi Hills. The lands as a rule are either ancestral property or belong to village communities, and are cultivated under unwritten but well-understood agreements. Of the wide

20: Hunter G-4 (no date) 1997 AR? Khasi AR?

extent of waste land, some is cultivated in a manner resembling the *jhum* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *jhumi* tenure. Any owning of land is exceptional, and there are no recognized rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 (423)

Manure is generally used in raising rice and potatoes. It is seldom, however, the dogs and litter of the cattle and other animals about the house being generally utilized for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 1s. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 12s. to 18s. per acre. 263 299 (435)

Irrigation for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and is a very telling reality. Rotation of crops is not practised in the Hills. 312

Model Farm.—The Shillong Model Farm, established in 1872, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red rangbar' and 'pheasant's eye'—were successfully introduced in 1872-73; but these are not looked upon favourably by the Khasiás, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, nectarine, and plum; and the tables of the European residents are supplied with vegetables from the garden attached to the farm. A *Manual of Potato Cultivation* compiled by the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the unknown of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1874-76 the sum of Rs. 1,722 177 245 697 654 177 245 697 654 (134) (134) 231 648 654

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

231 (£110, 0s.) was expended on the purchase of stock, including
608 cattle, sheep, and pigs from England. Even native cattle at the
654 elevation of Shillong fell off very much in the months of January and February from want of forage, and the Khasis at this season generally drove them to lower slopes. But one of the chief objects in keeping cattle at the farm was to obtain manure; and *mat kulai* (*Phaseolus radiatus*) was grown for them, cut green, and stacked for food. On this they did very well. In 1899-00, however, cattle disease broke out on the farm in a very virulent shape. One of 33 [illegible] died, and the animals imported from England all died. There was also a heavy mortality [771] in that year among the sheep and pigs. The following are the financial results for the two years:—1898-99—Expenditure, Rs. 13,057, 0, 3; receipts, Rs. 309, 0, 6; deficit, Rs. 12,687, 13, 11: 1899-00—Expenditure, Rs. 11,445, 8, 8; receipts, Rs. 1198, 13, 0; deficit, Rs. 10,246, 9, 8. Total deficit, Rs. 23,936, 7, 5, or £1595, 7s. In view of these figures the Chief Commissioner has determined to restrict farming operations to small experiments in improved soil crops, and, as a measure of economy, to dispense with the services of the superintendent. The future expenditure on the farm will be insignificant. The establishment now (1899) consists of a *sardar* on Rs. 30 and a *chaukidar* on Rs. 10 a month (total, £52 a year), under the direct control of the Deputy-Commissioner of Tawang; the total number of live-stock is 60 head.

648
654

Silkworm Culture, such as Mighra, Eusla, or Eenghra, are not common in the District, although the crops in the Jaintia Hills sometimes suffer from insects. So far as the Deputy-Commissioner is able to ascertain, no destruction of crops affecting the general harvest has occurred within the experience of the present generation. During the Orissa famine of 1866-67 the maximum price of common rice reached £1 per hundredweight, but no such distress was felt as to require Government relief operations. The price just mentioned was certainly equal to the rates prevalent in the famine-stricken localities; but prices always rule high in the Hills, and afford no just criterion of the state of affairs among the general body of the inhabitants. Distress was only felt by a small portion of the population, chiefly the Bengali immigrants residing in the District, who are generally a well-to-do class. The Hill people, as a rule, do not use pulses, which they grow only for export; but in case of actual famine, they might fall back upon this crop for their own food [illegible]

771

[816]

262

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

supply. As the District depends so largely for its supply of rice upon Sylhet and Kinwip, the state of the markets in those places exercises a greater influence on the rates in the Hills than any failure of the local harvest. In the year 1898 the price of common rice is said to have risen as high as 6 *seers* for the rupee, or 16s. 8d. per cwt., in consequence of the failure of the crops in the plains.

Roads and Means of Communication.—The following are the eight principal lines of road in the Khasi and Jaintia Hills:—(1) Road from Shillong to Cherrapunji, in Kinwip. This road has recently (1899) been opened for wheeled traffic throughout its entire length. The Deputy-Commissioner's Report for 1898-99 states that the number of passengers passing up and down may be estimated at about five or seven every month, and the number of carts already used at about 50. The *dak* brings travellers up to Shillong from Cherrapunji in two days by a comfortable and easy carriage service, while for natives a cheaper conveyance by bullock cart is available. At Cherrapunji there is a good *dak* bungalow in charge of a *khansamah*, where the usual accommodation provided in a hotel is to be found. The stages to Shillong are as follow:—(a) Cherrapunji to Sumdah, 17 miles. The road is good throughout. There is a *dak* bungalow in charge of a *chaukidar* at Sumdah, where grain and rice are procurable. (b) Sumdah to Nongpoh, 14½ miles. The road is hilly throughout, but good. At Nongpoh, which is at an elevation of 1500 feet, there is a *dak* bungalow in charge of a *khansamah*, from whom tea, liquors, and biscuits, etc. can be obtained. The *dak* bungalow is furnished with bedding, linen, etc. Grain and rice can be purchased in the *bazar*. (c) Nongpoh to Umwing, 18½ miles. At Umwing, elevation 1500 feet, there is a *dak* bungalow in charge of a *chaukidar*. Supplies or coolies are not procurable, but sometimes grain and rice can be purchased. (d) Umwing to Umjam, 9½ miles. At Umjam there is a Public Works Department rest-house in charge of a *chaukidar*. Supplies or coolies are not procurable. (e) Umjam to Shillong, 9½ miles, of which 6½ are a continuous ascent. At Shillong there are *dak* bungalows in the Artillery Lines, containing four separate rooms. A *khansamah* is in attendance, and the rooms are completely furnished with bedding, linen, etc. This entire road, which has a total length of 67 miles, is as perfect a hill road as could be seen in any country, and a model of engineering skill. (2) Road running from Cherrapunji across the Hills, via Sohpetbneng, Mawkyrwat, Cherrapunji

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

491 Pínjí, and Thoridghát, to Bholíganj in Sylhet; length, about 130 miles. Repairs to this road are effected partly by the inhabitants of the Native States, and partly by Government. (3) Cart road from Shillong to Máo-ílang, 14 miles. This road has been opened for cart traffic throughout. (4) Road from Shillong, *viâ* Jowái and Mukhtápur, to Jáintápur in Sylhet; length, about 70 miles. This road is being improved from year to year, and when finished the cost may amount to £50 per mile. (5) Road to connect Shillong with the Garo Hills, opened out from Márbisé, *viâ* Sob-iong, Kynchí, Máo-ker-ché, and Nongstoin, to within 20 miles of the boundary between the two Districts; length, about 52 miles. This road is at present only a fair-weather road. It was made in 1872-73, and when completed may cost £50 a mile. (6) Road to connect Shillong with the Confederate State of Shellá, bordering on Sylhet, from Lyn-kyn-tyng-noh *viâ* Pum-ston-ngdit to Sym-pher; length, about 16 miles. This road, when completed, will be about 60 miles in length. (7) Road leading *viâ* Lait-tyng-ket to Sob-ri-rim and Cherrá Pínjí; length, about 22 miles. This is at present a bridle path, but may eventually be the line for a cart road to Cherrá Pínjí. (8) Road from Jowái, in the Jáintiá Hills, to Nong-ri-tiong; length, about 12 miles. This road, when extended, will connect Jowái with the District of Nowgong in the Brahmaputra valley, and the estimated total length will be about 90 miles. Besides the above-mentioned eight roads, there are other bridle paths which facilitate access to remote places.

195 Coal Mines.—Coal exists in the Khási and Jáintiá Hills in connection with the limestone formation. As a rule the carboniferous strata are not extensive, and they are for the most part found in localities more or less inaccessible. In the Khási Hills coal has been discovered at the eleven following places:—(1) By-rang, altitude about 1040 feet above sea level; (2) Cherrá, 4218 feet; (3) Lait-tyng-iew, 4800 feet; (4) Máo-long, 600 feet; (5) Máo-ensh, 1500 feet; (6) Máo-syn-ram, 4000 feet; (7) Máo-don, 400 feet; (8) Máo-mai-ckhuré, 300 feet; (9) Máo-beh-lyrkár, 5000 feet; (10) Shellá, 800 feet; (11) Thúnjindth, 4400 feet. In the Jáintiá Hills at the five following localities:—(1) Ano-wí, altitude about 3800 feet above sea level; (2) Lá-ká-dong, 2200 feet; (3) Náp-pá, 300 feet; (4) Sah-tyng-gilh, 3300 feet; (5) Sher-mang, 4000 feet. The most extensive of the coal beds are those situated at Cherrá Pínjí in the Khási Hills, and at Lá-ká-dong in the Jáintiá Hills.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

The coal strata at the former place are calculated to extend over one-third of a square mile, with an average thickness of from 3 feet 6 inches to 4 feet; and the yield of the coal, if it could be worked, is estimated at 447,000 tons. At the latter spot the area of the coal-fields is computed to extend over 0·394 of a square mile, and the estimated yield of the mineral is about 1,100,000 tons. The coal at Cherrá Púnji and at Lá-ká-dong is in quality equal to some English coals; it is quick in its action, and consequently would generate steam rapidly; it cakes well, but gives out a large amount of smoke; it is fragile and easily broken. From the absence of that definite structure which produces the planes of division known to English miners as 'backs,' or joints in the coal, it breaks into unsymmetrical pieces, and consequently does not stow well. From its composition, quick combustion, and irregular cleavage, it is estimated to be from 5 to 7 per cent. inferior to good English coal; but as a gas-producing coal it is considered superior to English produce, both as regards quality and purity of the gas. It is also calculated to yield a good quality of coke. The market value of coal found in the Khási and Jáintiá Hills cannot be given with any approach to accuracy, owing to the expense of labour in the Hills and of carriage to the plains. The Station of Shillong, which consumes coal as fuel, derives its supply from the coal beds at Máo-beh-lyrkár, 18 miles distant, and the price is as high as £3 per ton. Lá-ká-dong is within six miles of Borghát, a village on an affluent of the Surmá, which is accessible all the year round by boats of 500 maunds, or 18 tons burden; but at present only coolie-carriage is available between Lá-ká-dong and Borghát. 135 [435]

The following is a brief history of the mines at Cherrá Púnji in the Khási Hills, and at Lá-ká-dong in the Jáintiá Hills:—Government holds a perpetual lease of the Cherrá Púnji mines from the chief or Siem of Cherrá, conditionally upon the payment by Government of a royalty of two shillings and eightpence for every five tons of coal quarried and removed from the mine, and also upon the terms that the people of Cherrá shall be permitted to work the beds on their own account. In 1844 Government transferred its right to work the mine to Captain Engledue, then agent of the Peninsular and Oriental Company, for a period of twenty years; but in the following year this gentleman, with the permission of Government, made over his lease to Messrs. Gisborne & Co., of Calcutta, who worked the mine for about two years, 316 648 655

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

316 and in 1851 transferred their rights to Mr. W. Moran, of Calcutta.
648 The last lessee, however, preferred buying his coal to mining it; and
655 Government, seeing that the mines were not worked in a satisfactory manner, resumed the beds in 1859, and advertised them for letting. No person, however, has since come forward to work the mine. The Lá-ká-dong coal mines are the sole property of Government, which in the year 1848 leased the mining rights to Mr. B. W. Darley. This gentleman in the following year made over his lease to Messrs. Gisborne & Co., who soon afterwards transferred it to Mr. Moran. This gentleman surrendered his lease in 1859, when the mines were advertised for letting, but no one has since come forward and undertaken to work the coal. Between 1850 and 1856, while the mines were worked, about 5100 tons of coal were extracted for exportation.

In Mr. Allen's Report, dated 1858, it is stated that the coal of the Hills then found a ready sale at Dacca and elsewhere at 8 *dnnás* per *maund*; and that the average quantity exported into Bengal was about
[435] 25,000 *maunds*, valued at Rs. 12,500, or £1250. According to the local trade reports, this exportation would appear to have entirely died out; but the Bengal registration returns record 2965 *maunds* of coal, valued at Rs. 1482, or £148, at the rate of 8 *dnnás* per *maund*, as exported from Sylhet District in the year 1876-77. This supply was probably derived from the Khási and Jáintiá Hills.

317 LIMESTONE QUARRIES.—A limestone formation prevails more or less along the whole southern face of the Khási and Jáintiá Hills. The quarries are chiefly situated in the beds and on the banks of rivers and water-courses.

The limestone-quarrying localities in the Khási Hills are the following twenty-six:—(1) Bha-wál; (2) Bor-syr-mai; (3) By-rang, *alias* Wáh-long; (4) Bor-púnjí; (5) Chún-jurá; (6) Dholai; (7) Dwárá; (8) Ichhámati; (9) Lúm-dih-long; (10) Lan-grin; (11) Long-long; (12) Máo-nai; (13) Máo-don; (14) Máo-kár-tillá; (15) Mohesh-khálí; (16) Máo-long; (17) No-kriá; (18) Páthárá; (19) Ram-seng-rai-skeh; (20) Soh-lai; (21) Silai; (22) Shellá; (23) Tanglá; (24) Tang-wai; (25) Um-song; (26) Um-tymá. In the Jáintiá Hills, the following seven:—(1) Chún-chhorá; (2) Lámá-pushi; (3) Lithánq; (4) Myrki Púnjí; (5) Nongthá-long; (6) Rúpnáth; (7) Rowai. The supply of limestone is literally inexhaustible. The wants of Calcutta and of the whole of Lower Bengal
648 have been satisfied from these hills from time immemorial. During
651 the year 1876-77 the estimated export was 1,600,000 *maunds*, valued
317

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

at Rs. 480,000, or £48,000, and the revenue derived by Government from the quarries was Rs. 67,266, or £6726. In addition, the Khási Chiefs receive a revenue from this source of more than £2000. 648 651 317

IRON.—The smelting of iron was once the chief industry in the Khási Hills, and a considerable quantity of the metal used to be exported into Sylhet, both in the crude and the manufactured state. Recently, however, this industry has almost died out, in the face of the competition of the superior article imported from England and sold in the plains at a cheaper rate. The indigenous methods of extracting, washing, and smelting the ore have been minutely described by Professor Oldham. The following description is taken from Mr. Allen's Report, dated 1858, at which date the annual export of smelted iron was estimated at 45,000 *maunds*, valued at Rs. 67,500, or £6750, at the rate of Rs. 1. 8 per *maund*: —'The ore is said to be most abundant and of the best quality in the State of Khyrim, especially at the villages of Nongkrím and Noyandri. A few iron articles, such as *dáos* or hill knives, *koddlis* or mattocks, spear and arrow-heads, are manufactured by the Khási smiths in the Hills; but the greater bulk of the smelted iron is sent to the plains for sale in circular lumps weighing about 4 or 5 *sers*. These lumps, called *birá*, sell at Chhaták for from Rs. 1. 4 to Rs. 1. 6 per *maund*. The best iron, however, which is beaten into bars called *peti*, sells for from Rs. 1. 10 to Rs. 1. 12 per *maund*. Khási iron is preferred to English, in consequence of its greater malleability. It is much used by the native boat-builders of Sylhet and the neighbouring Districts to make fastenings for the timbers of their boats. When brought into the market, it is more than half dross, and it is this circumstance which renders the iron trade unprofitable. The cost of carriage from the Hills to the plains is about 6 *dánás* per *maund*; and the traders, who are all Khásiás themselves, affirm that they get an average profit of only 2 *dánás* per *maund*.' The tables of trade for 1876-77 return no smelted iron as exported from the Hills, but Rs. 7000 of iron implements exported, against nails and ironmongery imported to the value of Rs. 18,000. 178 325 439 [326] [435] [501]

THE MANUFACTURES of the District, besides iron, consist of coarse cotton and *rundia* cloth, plain silver work, rude implements of husbandry, netted bags made of the fibre of the pine-apple, common pottery, and mats and baskets. With the exception of the 28 433

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

with the exception of the
326 manufacture of iron, in which the master blacksmith often employs
462 hired labourers, the other industries are generally followed by
463 females in their own houses. No class of labourers are hereditarily attached to any manufacture in a manner that affects their personal freedom. The system of advancing money for manufacturing pur-
452 poses does not obtain in the Khásí and Jáintiá Hills. The total
434 value of the manufactures of the District is stated to be between £2000 and £3000 per annum. No local manufactures are carried on by means of imported capital.

439 COMMERCE AND TRADE.—The external commerce of the Khásí and Jáintiá Hills is chiefly conducted on the southern boundary, through the District of Sylhet. The total value is more considerable than might be expected, owing to the fact that these Hills practically possess the monopoly of supplying Bengal with lime, potatoes, and oranges. Other important articles of export are raw cotton, stick-lac, betel-nut and *pán* leaves, and bay leaves or *tez-pát*. The exportation of iron, which was once large, has now almost ceased. The chief imports consist of rice, dried fish, cotton cloth, salt, and tobacco. On the whole, it would appear that the course of trade is about equally balanced. Trade statistics of more or less value are in existence. The earliest of such statistics are to be found in the Report of Mr. W. J. Allen, dated 1858. The information there given was based for the most part upon oral statements furnished by numerous native traders to Mr. Hudson, who then filled the office of Principal Assistant-Commissioner. It may be accepted as 'a fair representation of the state of trade in
439 the Hills' at that time. The imports and exports on the Assam
434 side were each estimated at about Rs. 15,000, or £1500. The trade with the markets in the Surmá valley was much larger. The total of the exports was valued at Rs. 700,000, or £70,000, giving a profit to the traders of Rs. 170,705, or £17,070. The chief items were:—Limestone, 1,700,000 *maunds*, valued at Rs. 306,000; potatoes, 50,000 *maunds*, value Rs. 125,000; oranges, 45,000,000 in number, value Rs. 78,750; smelted iron, 45,000 *maunds*, value Rs. 67,500; cotton, 12,000 *maunds*, value Rs. 42,000; betel-nuts, value Rs. 37,500; coal, 25,000 *maunds*, value Rs. 12,500. The total value of the imports was estimated at Rs. 350,000, or £35,000, being just one-half the value of the exports; the estimated profits are given as Rs. 44,325, or £4432. The chief items were:—Rice, 150,000 *maunds*, value Rs. 225,000; cloth of sorts, Rs. 25,000;

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

fish, fresh and dried, Rs. 20,000; salt, 2000 *maunds*, value Rs. 10,000. For the last three years, from 1874-75 to 1876-77, elaborate tables of the external commerce have been drawn up by the successive Deputy-Commissioners in charge of the District. There is, however, no organized system of trade registration, and the Chief Commissioner of Assam has expressed the opinion that the figures 'cannot be at all relied upon.' The items vary greatly year by year, which is partly due to the different principles of valuation adopted. For the year 1874-75 the total exports were valued at Rs. 1,371,830, or £137,183, being just double the estimated value twenty years ago; the imports were valued at Rs. 1,359,300, or £135,930, being an increase in the same period of nearly forty-fold. The excess value of exports was Rs. 12,530, or £1253. In 1875-76 the exports were valued at Rs. 1,721,761, or £172,176; the imports at Rs. 1,617,455, or £161,745, showing an excess on the export side of Rs. 104,306, or £10,430. The tables for 1876-77, given in full on the following pages (pp. 238, 239), are quoted from the Administration Report for that year. They are based partly upon returns of trade at the marts of Bholáganj and Jáintiápur, and partly upon such approximations as could be supplied by local traders. The total value of the exports amounts to Rs. 1,603,530, or £160,353; that of the imports to Rs. 1,576,483, or £157,648, showing a balance of Rs. 27,047, or £2704, in favour of the District.

The export of limestone in 1876-77 was 1,600,000 *maunds*, valued at Rs. 480,000, at the rate of Rs. 300 for 1000 *maunds*. These figures show no increase in quantity, but a large increase in value, over the estimates of twenty years ago. The registration system of river traffic in Bengal shows a total export during 1876-77 from the two Districts of Sylhet and Cáchár of 1,056,159 *maunds* of lime and limestone, valued at Rs. 742,118 at the rate of 12 *dánds* per *maund*. The difference between these two sets of figures for the same year is very considerable. It may be partly explained by the consideration that the Bengal estimate of value includes the stone after it has been calcined and reduced to lime. The trade in limestone is chiefly in the hands of Messrs. Inglis & Co., whose depot is at Chhaták, on the Surmá river. The connection of this firm with the trade of the Khási Hills is of very long standing. The founder, Mr. Henry Inglis, was the son-in-law of

Sentence continued from page 237.]

439 Colonel Lister, who filled the office of Political Agent from 1835 to
648 1854. In 1858, when Mr. Allen drew up his Report on the District, the trade both in lime and oranges was a monopoly of this Mr. Inglis. The stone is exported to Chhaták and other marts on the Surmá river, where some portion is burned and made into lime, and the remainder sold in the rough. The trade name in Bengal is 'Sylhet lime.'

439 The export of potatoes in 1876-77 was 200,500 *maunds*, valued
434 at Rs. 501,250, or £50,125, at the rate of Rs. 2. 8 per *maund*.

Text continued from page 238.]

This price is about the same as it was twenty years ago, but the quantity has increased fourfold. The potato was first introduced into the Hills in 1830 by Mr. David Scott, who was then the Governor-General's Agent. 'No greater boon could have been conferred upon the people.' The local trade is entirely in the hands of the Khásiás themselves, and the larger portion of the produce is despatched direct to Calcutta. According to the registration returns of river traffic in Bengal, the export of provisions (including vegetables) from Sylhet in 1876-77 was 123,108 *maunds*, valued at Rs. 369,324, or £36,932, at the rate of Rs. 3 per *maund*.

[177]
[244]

The export of oranges in 1876-77 was 9,400,000 in number, valued at Rs. 37,600, at the rate of Rs. 12 per 3000. These figures apparently show a great decrease since 1858. At that time Mr. Inglis possessed the entire monopoly of the trade, by means of the leases which he held from the Khásí Chiefs of all the valuable groves. The annual produce of his groves was estimated at forty-five millions of oranges, having increased from eleven millions within the

439
434
245
648

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

439 previous twenty years. The oranges, like the lime, were brought
648 down to Mr. Inglis' depot at Chhaták, where they were sold to
245 the dealers at the rate of about Rs. 1. 12 per 1000, or less than
434 half their present estimated price. It is stated in Mr. Allen's Report, that the Calcutta market was then chiefly supplied from the groves of Shella Púnjí and Bor Púnjí; the produce of the other villages was more perishable, and required to be sold in the neighbouring Districts. The fruit is known in Calcutta as 'Sylhet oranges.' The Bengal registration returns for 1876-77 show a total export from Sylhet of 64,505 *maunds* of 'fruit,' valued at Rs. 193,515, or £19,351.

439 The export of raw cotton appears to have greatly increased. In 1876-77 the total quantity exported was 36,000 *maunds*, valued at Rs. 216,000, or £21,600, at the rate of Rs. 6 per *maund*. Twenty years before the export had been only 12,000 *maunds*, valued at Rs. 42,000, at the rate of only Rs. 3. 8 per *maund*. The cotton is of inferior quality, with a short and woolly staple. It is chiefly consumed by the Sylhet weavers. The total registered export from that District in 1876-77 was only 4300 *maunds*, valued at Rs. 64,500,
434 at the high rate of Rs. 15 per *maund*.

439 The chief article of import now, as twenty years ago, is rice; for
[178] the hill-men have never grown sufficient for their own consumption,
[243] and the recent establishment of the Civil Station of Shillong has increased the demand. In 1876-77 the total imports of rice were estimated at 205,800 *maunds*, valued at Rs. 720,300, or £72,030, at the rate of Rs. 3. 8 per *maund*. Twenty years ago the imports were nearly as great, viz. 150,000 *maunds;* but the value was only Rs. 225,000, at the rate of Rs. 1. 8 per *maund*, or less than one-half the present value. The chief source of supply is Sylhet District, which sends its surplus to the tea gardens of Cáchár, as well as to these Hills, and also exported, in the year 1876-77, 214,000 *maunds* of rice and 433,100 *maunds* of paddy into Bengal.

The importation of fish (fresh and dried) has enormously increased. In 1876-77 the total amount was 35,900 *maunds*, valued at Rs. 215,400, or £21,540, at the rate of Rs. 6 per *maund*. Twenty years ago the value was only Rs. 20,000, but the quantity is not given. The preparation of dried fish is a flourishing industry in the adjoining District of Sylhet.

The importation of cotton cloth has increased in an almost equal proportion. The value in 1876-77 was Rs. 158,000, or £15,800, as

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

434

against Rs. 25,000, or £2,500, twenty years earlier. The supply of 439
piece-goods is derived directly from Dacca.

A curious feature in the trade of the Khásí and Jáintiá Hills is 441
the total absence of Márwári or Jain merchants—an enterprising class, who are found everywhere else in Assam, even to the farthest corners of the Brahmaputra valley. There are a few Bengálí traders from Dacca, who do not take up a permanent residence in the Hills; but the great bulk of the business remains in the hands of the natives, who themselves reap the profits and are said to be keen at a bargain.

The principal markets at the foot of the Hills, on the Sylhet side, 443
are Bholáganj, Chhaták, Lakhát, Jaíntiápur, Jafling, Pharálbázár, Máodong, Ponatit, Sónápur, Molághul, and Lengjut. Many of these are situated within the Sylhet boundary; but they are all frequented by Khásí and Synteng traders, who spend their whole time in passing from one market village to another. The markets or *háts* are held at regular intervals of eight days (for the Khásí week consists of this number), with the object of permitting the same people to visit the different places in rotation.

CAPITAL.—Such little capital as the people possess is either 454
employed in trade or lent out upon interest. In a few cases it is hoarded and allowed to remain idle. In small loan transactions, whether articles are pledged as security or not, the interest usually charged is one *ánná* in the rupee per month, or 75 per cent. per annum. In larger transactions the rate of interest per month varies from 2 to 3 per cent. Nothing is charged in the name of interest where lands are mortgaged as security for a loan, as the land is always made over to the mortgagee in lieu thereof, and he is only bound to restore it on payment of the amount lent. In petty advances for agricultural purposes, part of the produce is given by the cultivator at something less than market rates in repayment of the amount borrowed. Limestone quarrying is the only industry in 316
the District carried on by European agency. 648

REVENUE AND EXPENDITURE.—The revenue realized from the 648
Khásí and Jáintiá Hills has increased considerably in recent years. 651
As the Khásí States are treated as semi-independent, the receipts from that portion of the District are altogether insignificant, with the exception of the dues levied from the lime quarries. The larger part of the revenue in Jáintiá is derived from the house tax. For 1835, when British authority was first established in the Khásí Hills,

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

648
651

the total revenue is returned at £77, and the expenditure at £2061. By the year 1860-61, at which date the Jáintiá Hills were included, the revenue was £2194, and the expenditure was £4151. There has since been a large increase on both sides of the account, and the District now more than pays for the cost of administration. The budget estimate for 1870-71 calculated on a revenue of £6290, and an expenditure of £7853. In 1875, according to the figures of the Deputy-Commissioner, the revenue was £13,383, and the expenditure £9692. The Assam Administration Report for 1875-76 returns the gross revenue at Rs. 108,018, or £10,801, of which only Rs. 342 was derived from the land, and the total cost of officials and police of all kinds at Rs. 64,731, or £6473, showing an apparent surplus of Rs. 43,287, or £4328. This increase of revenue is the more satisfactory, considering that the Khásiás still remain practically untaxed.

Sources of Revenue.—The main sources of revenue are the following:—(1) Mineral revenue; (2) House tax. The mineral revenue consists of the rents derived from the lime quarries, which are leased for terms of years to the highest bidder at public auction after due advertisement. All such leases have to receive the sanction of the Chief Commissioner. In 1876-77 the total revenue from lime quarries was Rs. 67,266, or £6,726, 12s., being a decrease of Rs. 7892 on the previous year. The house tax is levied throughout the whole of the Jáintiá Hills, and in the British possessions in the Khásí Hills. The settlement is made with the head-man of each village, who is termed a *dolloi* or *sardár*. It is his duty to submit every year to the Deputy-Commissioner or subdivisional officer a list of the number of houses in his village, accounting for all changes since the previous assessment. Thereupon the Deputy-Commissioner or subdivisional officer makes the assessment according to the rate fixed for the village, which is either R. 1 (2s.) or Rs. 2 (4s.) per house, and submits the proceedings for the confirmation of the Chief Commissioner. In 1876-77 the house tax realized a total revenue of Rs. 13,714, or £1371, 8s., of which Rs. 10,654 came from the Jáintiá Hills. The land revenue is derived from a few petty estates lying at the foot of the Jáintiá Hills, which were transferred from the rent-roll of Sylhet District on the adjustment of the boundary between the hills and plains portion of Jáintiá. The settlement of these estates was made in 1856-57, for twenty years, in the same manner as the settlement of the other Jáintiá

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

estates. In addition, there are a few small holdings at Jowái, in the Jáintia Hills, which have been settled, after measurement, under the Assam Settlement Rules for a term of ten years. In 1876-77 the total land revenue amounted to Rs. 223, or £22, 6s., derived from 24 estates. Other small items of revenue are derived from fisheries, forests, stamps, and excise. In 1876-77 the rent of the fishery *mahâls* was Rs. 3321, or £332, 2s.; forests produced Rs. 773, or £77, 6s., of which Rs. 652 represents fees on the exportation of timber from the Khási States to the District of Kámrúp. In the same year stamps yielded Rs. 16,121, or £1612, 2s.; but this total includes the sale of postage and telegraph stamps, as well as the sum credited for service stamps. Excise produced Rs. 1216, or £121, 12s. The stamps are sold at the Treasury; there are no licensed vendors. The excise laws are applied only within the limits of the Stations of Shillong and Cherrá Púnjí, and throughout the Jáintiá Hills. There are no licensed distilleries in the District, and the free manufacture of country spirit is permitted both in the dependent States and in British territory; what is manufactured is mainly for home consumption. In 1876-77 there were in all 18 licenses in force—4 for imported spirituous and fermented liquors, 1 each for *máhát* and *chandu*, 2 for *gánjá*, and 10 for opium. The Khásiás and Syntengs are not addicted to the use of intoxicating drugs, which is confined to the people from the plains residing on British territory.

648 651 648 655 [274] 276

Courts, etc.—In the year 1835 there were two Magisterial and Civil Courts in the District. By 1850 the number had risen to four, which continues to the present time. The maximum distance of any village from the nearest court is 65 miles, the average distance is 25 miles. In 1835 one European official was permanently stationed in the District; in 1850, two; in 1862 and 1869, again one. In the last-mentioned year the subdivision of Jowái was opened in the Jáintiá Hills; and there have since been two officers in the District, a Deputy-Commissioner at Shillong, and an Assistant at Jowái. The total number of magistrates is three. These figures, of course, are exclusive of the staff of the Local Government, which has been established at Shillong since 1874.

692

Police Statistics.—For police purposes, the Khási and Jáintiá Hills are divided into the three following *thánás* or police circles, with two outposts:—(1) Shillong, with an outpost at Nongpoh; (2) Jowái; (3) Cherrá Púnjí, with an outpost at Thária-ghát, at the foot of the southern hills.

625 648

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

625 In 1835, when British authority was first extended to the Khásí
648 Hills, the cost of maintaining the police, from the rank of *jamáddr*
465 or head constable upwards, was £45; and in 1840, £57, 16s. By 1860, when the Jáintiá Hills had been annexed, and a *thána* opened at Jowái, the cost had risen to £480. In the year 1869 the strength of the regular police was 149 men in the Khásí Hills, and an additional 29 in Jáintiá.

In 1875 the police statistics of the Khásí and Jáintiá Hills were as follow:—The force consisted of 1 inspectors on a salary of upwards of Rs. 100 a month, or £120 a year; 3 sub-inspectors and *13 head constables on a salary of* less than Rs. 100 a month; and 113 constables on an average pay of Rs. 9 a month, or £10, 16s. a year. The total pay of subordinate officers amounted to Rs. 8340 or £834 a year; and the total pay of constables to Rs. 12,168 or £1216, 16s. Certain contingencies brought up the aggregate expenses to Rs. 24,969 or £2496, 18s. The total number of men of all ranks was 131. As compared with the area and population of the District, these figures show one man to every 16·49 square miles, or to every 153 persons of the population, maintained at a cost of Rs. 4. 1 or 8s. 1½d. per square mile, and of 2 *dnnás* 10 *pies* or 4¼d. per head of population. Of the total force, 1 officer and 13 men were employed to guard the jail, 3 officers and 23 men to guard the treasury and lock-up and to serve as escorts, leaving 14 officers and 77 men available for general duty.

648 CRIMINAL STATISTICS.—The District of the Khásí and Jáintiá Hills,
692 like the other Hill Districts of Assam, is administered by political officers, under special rules framed under Act xxii. of 1869. Petty criminal cases are disposed of by the indigenous magistracy, and only cases of a heinous character are reported to the political officers. Similarly, civil causes are referred to arbitration, according to the indigenous system of village *panchdyats;* and the Deputy-Commissioner reports that this system, while affording equal justice to the people, tends to preserve them from the evil of litigiousness.

674 In 1874 the total number of cases reported by the police to the
178 political officers was 83, as compared with 63 in the previous year. In these 83 cases, 102 persons were arrested, of whom 71 were put on their trial; 61 persons, or 86 per cent., were convicted, and 10 were acquitted.

Though little serious crime exists in the Hills, yet the number of offences shows a tendency towards increase. The Report of the

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

Deputy-Commissioner for 1876-77 states that in that year 168 persons in all were brought before the magistrates, the most common classes of cases being theft and house trespass. In the same year 89 civil suits were instituted, of which 83 were for money claims, 2 for immoveable property, 2 for restitution of conjugal rights, and 2 in connection with religion and caste. In the Political Court there were 31 cases tried during the year, of which 13 were civil and 18 criminal. In the latter class of cases process issued against 60 persons, of whom 20 were convicted and 40 acquitted. The details of the two following cases will illustrate the condition of social life in the District. The first was a case of grievous hurt. The Siem of Myl-liem had sent four persons to fetch a man named U Dorja, who had been selected to marry the Siem's sister. While on their way the messengers were attacked by a number of persons, evidently relatives of U Dorja who were opposed to the marriage. One of them was severely beaten, and died within twelve days from pneumonia. The offenders, numbering five in all, were sentenced to pay a fine of Rs. 10 (£1) each, or in default to suffer fourteen days' imprisonment. The second case was one of oppression. It originated in a dispute about land, situated in a locality over which both the Siem of Nongklao and the Lyngdoh of Soh-iong claimed to exercise jurisdiction. The parties out of possession had gone to lay their complaint before the Siem, whereupon the Lyngdoh, with eight other persons, seized three of the complainants' kinsmen, ill-treated them, and kept them in durance with the object of having the complaint submitted to himself for adjudication. The Lyngdoh was sentenced to a fine of Rs. 50 (£5), and his companions were warned and discharged.

JAIL STATISTICS.—There are two jails in the Khási and Jáintiá Hills:—(1) The jail at Shillong, which is directly under the charge of the Deputy-Commissioner; and (2) the lock-up at Jowái, under the Assistant-Commissioner. It has been proposed to build a new jail at Shillong; the present structure consists only of bamboo huts, surrounded by a fence of the same material.

The following are the jail statistics for 1875:—Daily average number of prisoners, 40·91, of whom 1·07 were females; daily average number of sick, 1·42; number of deaths, 4, or 10 per cent. of the average daily strength. The total expenditure was Rs. 7430 (£743), or an average of Rs. 181 (£18, 2s.) per prisoner. This high rate of expenditure is due to the cost of rations at Shillong.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

697 In addition, a total of Rs. 899 (£89, 18s.) was expended on jail buildings. The manufacturing account shows cash receipts amounting to Rs. 60, against an expenditure of Rs. 29, or a net profit of Rs. 31 (£3, 2s).

797 871 648 EDUCATIONAL STATISTICS.—The management of education in the Khási and Jáintiá Hills is entirely in the hands of the Welsh Calvinistic Mission, who first established themselves in the District about the year 1844. Though the Khásiás are naturally dull, and children are taken away from school before they have obtained more than a smattering of instruction, yet the perseverance of the missionaries has been rewarded by most satisfactory results. It is stated, in the Report of the Inspector of Schools for Assam for 1874-75, that 'a much larger proportion of the Khásiás know a little of reading, writing, and arithmetic than is the case, probably, in any other District of either Assam or Bengal.' Female education, owing to the interest taken in this work by the wives of the missionaries, is also in a comparatively advanced condition. The missionary schools are largely subsidized by grants in aid from Government. The teaching is conducted in English and in Khási, the Roman character being used in both cases.

[562] [212]

The following paragraphs are compiled from the Education Report for 1874-75, above referred to. In that year the total number of schools open in the District was 73, attended by 1666 pupils. As compared with the area and the population, these figures show one school to every 84·34 square miles, and one pupil to every 85 inhabitants. As compared with the total number of males under ten years of age, the number of boys only attending school (1322) shows one scholar to every 13·1. The total expenditure on education in the same year was Rs. 17,722. 11. 3, or £1772, 5s. 5d.; towards which Government contributed Rs. 10,443. 9, fees and fines produced Rs. 228. 5. 3, while the remainder (Rs. 7051. 4) was expended by the Missionary Society from its own funds. The average cost of educating each pupil was Rs. 10. 10. 4, or £1, 1s. 3½d.

648 797 872 PRIMARY SCHOOLS.—With the exception of the schools at Cherrá Punji, Jowái, Shillong, and Shellá, all the schools in the Hills may properly be classed as primary, though several are returned as middle vernacular schools. On this principle the total number of primary schools is 64, in 45 of which a little English is taught. These 64 schools had 1226 pupils on their rolls at the close of the year 1874-75, and an average daily attendance of 829, comparing

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

favourably with an average attendance of 694 in the preceding year. Of the pupils on the rolls, 132 were professed Christians, 36 Hindus, and 1058 Khásiás. The total cost was Rs. 7107. 11. 6, or £711, 15s. 3d., towards which Government contributed Rs. 3246. The average cost of each pupil was Rs. 8. 3. 7, or 17s., of which Rs. 3. 14. 7 represents the share paid by Government. The chief failure among the Khásiás is stated by the Inspector to be in arithmetic. Four primary scholarships were awarded during the year by the Deputy-Commissioner, on the recommendation of the secretary to the Mission. These scholarships are of the value of Rs. 3 a month, or £3, 12s. a year, and are tenable for two years.

MIDDLE ENGLISH SCHOOLS.—There were four schools of this class during the year under report, with 397 pupils on the rolls, and an average daily attendance of 243. The total expenditure was Rs. 4581. 13. 9, or £458, 4s., towards which Government contributed Rs. 1478. 8; the average cost of each pupil was Rs. 18. 13. 7, or £1, 17s. 8d.

FEMALE INSTRUCTION.—The Khásí and Jáintia Hills is the only District of Assam, and one of the very few throughout all India, in which female instruction can be said to exist. During 1874-75 the number of girls attending the schools increased from 141 to 344, or by more than 41 per cent., showing 4·7 girls at school to every thousand of the female population, as opposed to ·4 in the Province generally. Of this number 24 were taught by Mrs. Hugh Roberts of Cherrá Pínji, and 18 by Mrs. John Roberts of Shillá. During the year five of the girls were sent out as teachers, of whom one was placed in charge of the Shillong girls' school, which has 29 pupils.

NORMAL SCHOOL.—According to the classification adopted by the Education Department, the institution at Cherrá Pínji, under the management of the Rev. Hugh Roberts, is described as partly 'Government normal' and partly 'aided English.' In 1874-75 the number of pupils on the rolls was 43, and the average attendance 39. There is a class of 10 girls, and of the 16 teachers turned out during the year, 3 were girls. The total cost was Rs. 4052. 6. 6, almost the whole being paid by Government. The average cost of each pupil was Rs. 105. 0. 3, or £10, 19s., of which Rs. 105. 0. 11 represents the share of Government. The following paragraph, quoted from Mr. Roberts' Report, illustrates what the missionaries have effected, and also the difficulties with which they have to contend:—'Cases have been brought to my notice during the past year

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

648 of parents undergoing considerable privations rather than deny their
797 children education; and in many families it has become a matter of
871 ordinary routine to send the children to school. This only refers to the younger children; for after boys have attained their fourteenth or fifteenth year, their parents grow impatient for their pecuniary
858 assistance. It is the custom among the Khasis to insure very young children to work, so that they may earn enough to support themselves as soon as ever they can manage scrap and basket. It is common for a boy to realize from ten *pice* to five *annas* a day for his parents; and it is considered sufficient sacrifice for the latter to have kept him at school up to his fourteenth year.'

631 'Amanat States.—The following is a list of the nineteen semi-
651 independent Khasi States or Democracies, with the particulars
413 of information that are available for each, taken from the Assam Administration Report for 1875-76:—

(1) Bhawal or Warjah.—Name of Siem, U Ramsan Singh, age in 1876, 16 years; approximate population of State, 389; estimated gross revenue—from market dues, Rs. 10; from *mikhlad* on lime quarry, Rs. 16,000—total, Rs. 16,010, or £1601; products, rice, millet, *betel* or betel leaves, black pepper, Piper nigrum; minerals, lime.

(2) Cossna or Sohsan.—Siem, U Hijan Mitek, aged 40; population, 8060; revenue—from market dues, Rs. 7000; judicial fines, Rs. 150; *mikhlad* on lime quarry, Rs. 200; *nankhlit* holding in Sylhet, Rs. 1300—total, Rs. 8650, or £865; products, cotton, millet, betel-nuts, *pân*, oranges, black pepper, Piper nigrum, chillies, turmeric, ginger, and honey; manufactures, bamboo mats and bamboo baskets; minerals, lime, iron, and coal.

(3) Sohsla.—Wihaddibha, U Jirdi, aged 25, and U Rai Singh, aged 35, of whom the former can read and write both Khasi and Bengali a little; population, 5500; revenue—from market dues, Rs. 300; judicial fines, Rs. 400—total, Rs. 700, or £70; products, oranges, betel-nuts, and pine-apples; manufactures, bamboo mats and bamboo baskets; minerals, lime and coal.

(4) Kyrem or Nongkrem.—Siem, U Khar Singh, aged 50; population, 10,504; revenue—from pension allowed by the British Government, Rs. 1800; market dues, Rs. 3000; judicial fines, Rs. 400; *mikhlad* on lime quarry, Rs. 1500; contributions for State purposes, Rs. 2000—total, Rs. 10,700, or £1070; products, rice, cotton, millet, 'Job's tears,' cassia-bark, cinnamon, *sulphur*

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

(2) kind of turmeric, betel-nuts, Indian corn, *pán*, oranges, lac, potatoes, black pepper, Piper nigrum, chillies, turmeric, ginger, and honey; manufactures, cotton cloth, *eri* silk cloth, *dáo* or hill knives, *kuddlis* or mattocks, knives, hammers, crowbars, wedges, mats, and baskets; minerals, lime, coal, and iron. 631 651 433

(3) MYLIOR or MYLIUM.—Siem, U Hain Mísik, aged 30; population, 10,266; revenue—from market dues, Rs. 250; State contributions, Rs. 1200; judicial fines, Rs. 225; forest rent, Rs. 15—total, Rs. 1690, or £169; products, cinnamon, sugar-cane, rice, 'Job's tears,' Indian corn, *sohphlang*, ginger, and millet; manufactures, *dáo* and baskets; minerals, iron.

(4) LANGRIN or LYNGRIN.—Siem, U Bor, aged 25; population, 1867; revenue—from market dues, Rs. 150; *mihkhed* on lime quarry, Rs. 700; forest rent, Rs. 60; fisheries, Rs. 50—total, Rs. 960, or £96; products, rice, millet, chillies, turmeric, and ginger; minerals, lime and coal.

(5) MAHRAIN.—Siem, Ardhar Singh, aged 38; population, 6157, revenue—from State contributions, Rs. 400; market dues, Rs. 120; forest revenue, Rs. 55; *mihkhed* on lime quarry, Rs. 350; judicial fines, Rs. 100—total, Rs. 1025, or £102. 10s.; products, 'Job's tears,' black pepper, Piper nigrum, chillies, bay leaves, honey, Indian corn, *sohphlang*, cinnamon, cowtchouc, sugar-cane, and ginger; manufactures, *dáo*, *kuddlis*, and hammers; minerals, iron and lime.

(6) MAOYANG or MAO-YONG.—Siem, U Jit Singh, aged 33; population, 1238; revenue—from lime quarries, Rs. 252. 8; house tax, Rs. 9; rent of fisheries, Rs. 50; judicial fines, Rs. 100; State contributions, Rs. 90—total, Rs. 501. 8, or £50. 3s.; products, honey, bees-wax, cotton, rice, millet, 'Job's tears,' *sohphlang*; manufactures, mats; minerals, lime.

(7) MAO-SYW-RAM.—Siem, U Rammen, aged 29; population, 947; revenue—from market dues, Rs. 180; State contributions of an uncertain nature, Rs. 150—total, Rs. 330, or £33; products, potatoes, millet, chillies, turmeric, honey, and ginger; manufactures, mats; minerals, lime, coal, and iron.

(10) MALAC-SEM-MAT or MALASCHAMAT.—Siem, U Shongram Singh, aged 33; population, 299; revenue from market dues, Rs. 50; *mihkhed* on lime quarry, Rs. 750; State contributions, Rs. 50; forest revenue, Rs. 50—total, Rs. 900, or £90; products, rice, millet, 'Job's tears,' ginger, chillies, turmeric, bay leaves, betel-nuts, and oranges; manufactures, mats; minerals, lime.

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

651
433

(11) Mawlai.—Siem, U Ron Singh, aged 28; population, 1308; revenue—from market dues, Rs. 15; State contributions, Rs. 100—total, Rs. 115, or £10, 10s.; products, rice, millet, 'Job's tears,' ginger, chillies, turmeric, sulphur, Indian corn, sugar-cane; manufactures, none.

(12) Nongthymmai or Nong-kan-rum.—Siem, U Kaan, aged 28; population, 361; revenue—from market dues, Rs. 100; judicial fees, Rs. 30—total, Rs. 130, or £13; products, rice, 'Job's tears,' Indian corn, sulphur, potatoes; manufactures, none.

(13) Nongkilan.—Siem, Kiew Singh, aged 30; population, 1304; revenue—from market dues, Rs. 600; State contributions, Rs. 800; judicial fees, Rs. 50; forest dues, Rs. 600; cost of State land, Rs. 10—total, Rs. 2060, or £206; products, potatoes, rice, millet, 'Job's tears,' Indian corn, sulphur, cucumbers, cinnamon; manufactures, cotton, *dolitis*, *dhis*, and cowhair; minerals, lime.

(14) Nong-spoh.—Siem, U Sep Singh, aged 33 (died in 1891); population, 871; revenue, from commission on *mouhdis* in Khasi Hills District, Rs. 100, or £10; products, rice, potatoes, honey, beeswax; manufactures, *dhis*; minerals, iron.

(15) Nongstoin.—Siem, U Ten Singh, aged 38; population, 7563; revenue—from market dues, Rs. 1000; lime quarries, Rs. 300; State contributions, Rs. 1500; judicial fees, Rs. 1000—total, Rs. 4400, or £440; products, lac, honey, beeswax, honey, cucumbers, bay leaves, rice, millet, 'Job's tears,' sugar-cane, chillies, sulphur; manufactures, earthenware, pottery, cotton cloth, *dhis*, and spades; minerals, lime and coal.

(16) Rambrai.—Siem, U Amar Singh, aged 38, who can read and write Assamese a little; population, 1232; revenue—from market dues, Rs. 40; judicial fees, Rs. 150; forest rent, Rs. 250—total, Rs. 440, or £44; products, rice, 'Job's tears,' ginger, chillies, millet, and Indian corn; manufactures, cotton cloth.

(17) Jyrang.—Sordar, U Mon Singh, aged 33; population, 581; revenue, *nil*; products, rice, millet, ginger, chillies, 'Job's tears,' cucumbers; manufactures, cotton cloth.

(18) Dwara Nong-tyr-wan.—Sordar, U Jaonni, aged 29; population, 378; revenue—from *mulkhad* on lime quarry, Rs. 1680; fees for cutting timber, Rs. 35—total, Rs. 1715, or £171, 10s.; products, rice, millet, oranges, betel-nuts, *pân*, and turmeric; manufactures, small mat; minerals, lime.

(19) Mao-wan.—Sordar, U Mohur Singh, aged 29; population,

[illegible]; revenue, [illegible]; products, millet, sesamin, hemp-seed, jack-fruit, pine-apples, chillies, and bay leaves; minerals, lime and coal. 631 651

These estates give the following totals for the ancient Khiri Raiyat or Demesnes:—Population, [illegible]; revenue, Rs. [illegible], or £[illegible], [illegible], of which Rs. [illegible], or £[illegible], is derived from land revenue. The aggregate area of these Raiyats is therefore assumed at [illegible] square miles. 633

Subdivisional Establishment.—The twenty-five local divisions which constitute the Jowki Hills are regarded as forming a separate subdivision, under the charge of an Assistant-Commissioner, whose headquarters are at the village of Jowki. This Subdivision dates from 1889, for which year the separate cost of administration is assumed at £[illegible]. The following statistics, referring only to the Jowki Hills, are taken from the Report of the Assistant-Commissioner for 1898-99; for the rest, all information is included in the preceding sections of the Imperial Account, which apply generally to the whole District of the Khiri and Jowki Hills. In the year 1898-99 the total revenue of the Jowki Subdivision amounted to Rs. [illegible], or £[illegible], of which Rs. [illegible] was derived from the house tax. The total value of the exports from the Subdivision was estimated at Rs. [illegible], or £[illegible], viz., including [illegible] maunds of raw cotton, valued at Rs. [illegible], and [illegible] maunds of lac, valued at Rs. [illegible]. The total value of the imports was estimated at Rs. [illegible], or £[illegible], chiefly cotton and woollen cloth from Bengal, valued at Rs. [illegible]; silk cloth from Assam, Rs. [illegible]; [illegible] maunds of rice, value Rs. [illegible]; [illegible] heads of dried fish, value Rs. [illegible]; [illegible] maunds of salt, value Rs. [illegible]; [illegible] maunds of tobacco, value Rs. [illegible]. These figures are compiled from reports submitted by the police-sentinel at Jowki, on the Jowkipur road, and from information collected from the chief traders of Jowki. They show an apparent balance of trade against the Subdivision amounting to Rs. [illegible], or £[illegible], viz. The population of Jowki and the surrounding villages is given below. 651 652

Climate, Temperature, Meteorology.—The climate of the Khiri and Jowki Hills is mild and equable. In Shillong the thermometer within doors ranges from about [illegible] in December to [illegible] or [illegible] in the hottest months. Out of doors the day heat varies between about [illegible] in the cold weather and [illegible] in May and June. A temperature higher than [illegible] is seldom recorded. During the three years ending 172

132 In 1911, the highest maximum temperature was registered in the month of August, the lowest minimum in January. From November until the end of March the weather is dry and bracing. Hoar-frost lies upon the ground almost every morning in the months of December, January, and February. Shallow water occasionally freezes over, but snow never falls.

The rainfall at Cherrá Pónjí is enormous, varying between 400 and 500 inches per annum. The heaviest fall is in the months of June and July. As much as 50 inches has been collected in one day in July, and 150 inches has been registered as the total rainfall of that month. The average rainfall of the three years ending in 1911 is returned at 466·91 inches. It is affirmed that a total of 600 inches fell in 1870, of which 466 inches is assigned to the single month of July. This excessive rainfall can be readily accounted for by the abrupt manner in which the hills at Cherrá Pónjí rise from the plains on the south. The vapour-bearing breezes of the south-west monsoon, sweeping across the heated, flooded plains of Lower Bengal, suddenly strike against the hills. The vapour as it ascends gets condensed into fogs and mists, and finally, when it reaches the crest of the range, discharges itself in torrents of rain, unequalled by that recorded in any other part of the world.

At Shillong, which is only 50 miles north and a little higher than Cherrá Pónjí, the average rainfall is only about 65 inches, but between these two stations three higher ranges intervene, which deprive the clouds in passage of a considerable portion of their moisture. During the three years ending in 1911, the average rainfall at Shillong was 65·65 inches.

The rainfall at Jowai, a subdivisional station in the Jaintia Hills, 40 miles distant from the plains, holds a mid place between that at Cherrá Pónjí and Shillong, and is estimated at 120 inches in the year. During the three years ending in 1911, the average rainfall at Jowai was 119·60 inches, but in the last of these years there as much as 200·00 inches was registered, of which 150·50 inches fell in the month of June.

133 The District is liable to shocks of earthquake. In September 1897 considerable damage was done in the bazaar in Shillong by a shock which extended with great severity as far as Gauhati, and several minor shocks were experienced in the year 1898-99.

144 Diseases, etc.—Generally speaking, the climate of Shillong is pleasant and congenial to Europeans. English children thrive

172

20: Hunter G-4 (no date) 1897 AR 7 Khasi AR 7

unsuitable, and there are few indigenous diseases of any kind. Malarious fevers of local origin are unknown, and cholera never prevails in the Hills except when directly imported from the plains. Notwithstanding the excessive rainfall, the climate of Cherrá Pinjí also is pleasant and salubrious. The rainfall is confined in great part to the five months from May to the end of September. For the rest of the year the weather is mild and very equable, and in the winter months almost pleasanter than that of Shillong. 164 132

Smallpox is the chief scourge amongst the Khásiás. The fears of more than half the people are accused by the marks of this disease. Strenuous efforts have recently been made to introduce vaccination, and with some success. Within the past three years nearly 9000 children have been vaccinated. The number of vaccinations in 1896 was 1,909, as compared with 1848 in the preceding year. 164 [751] [643]

Dysentery and bowel complaints generally prevail to a considerable extent; and, as at most other hill stations in India, the English residents at Shillong occasionally suffer from these diseases. Diseases of the liver are also not uncommon, mostly affecting persons who have recently arrived from the plains, probably from unhealthy localities. When they have once passed through a short period of acclimatizing indisposition, most English residents at Shillong enjoy excellent health.

The moist country lying along the foot of the Hills, especially on the southern side, is extremely malarious; and people passing through, especially pedestrians who travel without comforts and expose themselves to great fatigue, contract remittent fevers and agues of a severe type.

Epidemics.—The following is a brief notice of some recent epidemics. Cholera made its appearance in the Hills in May 1869, travelling from the direction of Jaintiápur, on the borders of Sylhet. It lately showed its presence by a few sporadic cases from time to time until the 10th July, when the disease broke out in an epidemic form among the police and in the jail. The police and the prisoners were at once moved into camp, and communication restricted as much as possible. These precautions probably had the effect of preventing the spread of the disease at Shillong. The epidemic lasted a week; it attacked twenty-four persons, of whom fifteen died. From Shillong the disease travelled southwards, the people deserting their villages as the plague broke out. In the 731

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

731 pre-eminently filthy villages on the Cherrá Pínji plateau the epidemic appears to have found a fitting home, for it stayed among them for a period of nine weeks and a half. The civil surgeon reports the deaths at Cherrá Pínji and the surrounding villages to have amounted to about 175 out of a total of 230 cases. During the year 1876-77 hooping-cough and small-pox were prevalent in an epidemic form. In the Jáintiá Hills small-pox is stated to have caused 47 deaths, chiefly during the months of June, July, and August. Some fatal cases of hooping-cough occurred among the Khásí children in the village of Mínkhar, near Shillong. The only two cases of cholera reported were in the Jáintiá Hills.

16 VITAL STATISTICS.—A general system of registration is not {659 attempted throughout the Khásí and Jáintiá Hills District. Statistics 648} of births and deaths are only collected among the inhabitants of the Stations of Shillong and Cherrá Pínji, and in the selected area in the vicinity of Jowái, which comprises the following seven villages:—Jowái, Nongkah, Nartiang, Mylíem, Amwí, Rollíang, and Shangpíng. This selected area has a population of 10,504. Each village forms a distinctly-circumscribed community, in which the statistics are readily ascertained and reported by the *dolói* or headman. The returns may be regarded as extremely close to the truth, both for births and deaths; and they thus furnish an approximate statement of the health of the entire Hills. In 1879 the total number of deaths in the selected area was 351, showing a death rate of 28 per thousand; the number of births was 431, or 34·2 per thousand. The total population of all the places in which vital statistics are collected is 15,458 persons, among whom 428 deaths were recorded in 1879, showing a death-rate of 27·6 per thousand, as compared with 27·3 per thousand in the preceding year. The deaths were thus distributed—24 from cholera, 298 from fever, 58 from bowel complaints, 2 from snake-bite or wild beasts, and 68 from all other causes. The mortality from fevers was the highest recorded throughout the entire Province. On this the civil surgeon observes:—"There are few local sources of malaria in the Hills. Many of the deaths from fever were probably due to typhoid, induced by the use of impure water and by the filthy state in which the 312 people live. There is no attempt at conservancy in a Khásí village. 364 In Jowái, a good specimen of the class, the lanes and pathways are 164 strewn with excrement and house refuse. Drinking water is got from wells in the heart of the village, fed by the drainage of the

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

312
364
[164]

surface soil of the hills upon which the houses are built.' Cholera is attributed to importation from the plains.

SANITATION.—It has already been stated that the ordinary Khásí villages are absolutely destitute of any conservancy arrangements. The sanitary condition, however, of the Station of Shillong is described as 'good.' The natural drainage is excellent. Drinking water is obtained chiefly from hill streams, and on the banks of these streams conservancy regulations are enforced. The water is conducted into the town by means of an artificial water-course. Public latrines have been erected at suitable places inside the town. The staff of sweepers and bhiśtis keeps the roads and drains clean, and the surface generally free from pollution. The sanitary condition of the cantonment is reported to be very good.

743

CHARITABLE DISPENSARY.—There is one dispensary in the Khásí and Jaintia Hills—at the Station of Shillong. It was first opened in 1872, and considerable additions have since been made to the building. During 1874 a total sum of Rs. 773. 8, or £77. 11s., was expended on new constructions and repairs, towards which the European residents subscribed Rs. 329. There is now accommodation for 10 male and 3 female patients. In that year the total number of in-door patients treated was 22, of whom 9 died, giving a death-rate of 20.45 per cent. The number of out-door patients was 919, or an average daily attendance of 7.8. Of the grand total of patients of both classes, only 31 were females. The largest number of cases are classified under the headings of fevers and constipation and colic. The total income during the year was Rs. 1398. 13. 9, or £139. 17s. 8d., of which Government contributed Rs. 300 for salaries, and an additional Rs. 300 as a special allowance. The European subscriptions amounted to Rs. 863, as compared with Rs. 33 subscribed by natives. The total expenditure was Rs. 1187. 13. 6, or £118. 16s., leaving a balance in hand of Rs. 410. 14. 3. The chief items were Rs. 480 for salaries of medical subordinates, Rs. 180 for servants' wages, and Rs. 100 for dieting of sick. There were 33 minor operations performed during the year.

[164]

755

The people of the District have no system of medicine of their own, and no native practitioners. Their sole remedies consist in divination and incantation. The only indigenous native drugs are chiretta and wormwood. As stated in a previous paragraph, a small cinchona plantation was established by Government at Pangthúm in 1869.

I. Introductory Remarks

601
114

Professor K. P. Chattopadhyay (Calcutta University) published in 1941 an analysis of Khasi kinship terms [1] based on eight genealogies which he collected in the Mawphlang area, about sixteen miles south-west of Shillong [2]. He discussed in this paper a previous publication by Professor Hodson [3] where special features of certain Khasi kinship terms are held to prove the pre-existence of a dual system in a one-time Khasi social order and he quotes also the late Rai Bahadur S. C. Roy's work on Khasi kinship [4] and lists of Assamese relationship terms, contained in "Census of India Reports" [5] and Khasi terms in U Nisson Singh's "Khasi-English Dictionary" [6], P. R. T. Gurdon's monograph on the Khasi [7] and in Sir Keith Cantlie's "Notes on Khasi Law" [8]. Discussing these previously published papers, Chattopadhyay arrives at the conclusion that Hodson's hypothesis of a dual organisation in a hypothetical former Khasi society was not justified [9].

question and indeed has been compiled without knowledge of Professor CHATTOPADHYAY's work, and before he very kindly sent a private copy of this work, which had not been available to me previously. 601 122 128

The present paper offers data on the following subjects:

1. Khasi kinship terms from the Mawshai Khasi plateau-area in the Khyrim State, about 20 to 30 miles south-east of Shillong, which are in some minor details different from the Mawphlang data, collected by CHATTOPADHYAY, south-west of Shillong; 601 101 128
2. Comparative data from the Wár-Khasi;
3. from the plateau-area of Jowai in the Jaintia [10] Hills, and
4. from the Wár-Jaintia;
5. Aspects of the Khasi kinship terms, with special reference to the matrilineal order of society, and to the respective position of women and men there, especially the particular consideration which the biological relationship through the father receives in kinship terminology, in spite of the emphasis on the matrilineal structure in Khasi society (comp. term No. 1 of the list and its discussion in para 3/b of the present paper, on p. 409).

The data were collected in field researches to which I was enabled by two Research Grants for comparative studies in matrilineal civilizations of India, given by the Viking Fund Inc. (now: Wenner-Gren Foundation for Anthropological Research) in New York, during the periods 1949-50 and 1951-52. My gratefulness to the foundation for enabling me to carry out these field researches, as well as to the University of Madras, for granting me Sabbathical leaves for the same purpose, is here once more recorded. 122 [114]

My research programme was based on the first tentative working hypothesis, laid down in my book "Mother-right in India" [11], but includes also various other aspects of study which have not been pre-planned, or even considered there [12], as for instance also the present comparative study of kinship terms in areas of four Khasi dialects and their special significance to the Khasi matrilineal social system. The material was collected during a five weeks house-to-house study in the recently founded Plateau Khasi village Maw Syn Jri, during April and May 1950. This village consisted mostly of houses, owned by Khasi elder sisters and inhabited by them, with their families, after they had left the ancestral home in the main village Kharang, about one mile across the valley on the western side of the new settlement. The ancestral family houses there were in the possession of either the mother, or, if she was no more alive, the youngest daughter of the family, the *ka khon khadduh* [10]. 121 114 101 621 [601]

[10] Jaintia, (Pnar or "Synteng") are the Khasi speaking eastern neighbours of the Khasi proper. As among the Khasi, so also among Jaintia the people in the cool plateau highlands are in many ways different from those who settled in the lowlows tropical rainforests of the southern slopes, now situated just north of the East Pakistan frontier: — the so-called Wár-country, where economy is mainly based on pan-leaf gardening.

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

105 It will here be recalled that the Khasi are a matrilineal agricultural
[175] people, pre-litterate until the advent of the British in the sixth decade of
[197] the 19th century, organized under democratically ruling *siem*, or Khasi
144 princes and chieftains and speaking an Austro-Asiatic language [14]. Their physical affinities are unmistakably mongoloid and quite distinct from the Assamese speaking plains-Indians, — but not from the other mountaineers of Assam, Nepal and even Burmah or China, with whom they feel to be more closely related, as with the Indian plainspeople, as some of the tribal designations in the following lists of terms for Non-Khasi testifies (comp. No. 41 as against No. 42, 43 and 43/a-c).

114 In the collection of the material, I was hampered by my inability to
122 pick up the Khasi language sufficiently quickly, for conversation without the help of an interpreter, but on the other hand greatly eased by generous and voluntary assistance on the part of several Khasi friends, especially U Ekimar Singh, the President, Unitarian Union, Khasi- and Jaintai Hills and his (Khasi) wife, Ka Austria [15], who offered me hospitality in their house at Maw Syn Jri, during my stay there. Dr. H. LYNGDOH, Shillong, the author of detailed accounts on Khasi religious ceremonial and institutions [16], U Jeeban Roy, a leading Pnár gentleman of Jowei in the Jaintia Hills, Ka Ellen Giri, Principal, Govt. Basic Education Training Centre, Malki, Shillong, Ka Kongmen, Shillong, and U David Roy, Prime Minister (retd.), and a number of hospitable Wár Khasi and Wár-Jaintia pan-leaf cultivators in the southern slopes of the Khasi- and Jaintia Hills, especially from the villages Mawlat and Padu, also helped me greatly in my task. My thanks are due to all of them.

101 The data, submitted and briefly described in this paper were thus
114 collected in four different areas.

1. The South-eastern corner of the Khasi-Hills (plateau-area),
2. the southern slopes of the Khasi Hills, the "Wár-Khasi country" between the Khasi plateau proper and the northern boundary of East Pakistan,
3. the central plateau of the Jaintia Hills, round its capital market Jowei, and
4. the southern slopes of the Jaintia Hills, the "Wár-Jaintia country" between these and a section of the northern boundary of East Pakistan, further to the East than area 2.

197 Slightly different Khasi dialects are spoken in these four regions, Jaintia (Pnár or "Syntong") and Wár-Jaintia being more akin to each other, similarly as Plateau-Khasi and Wár-Khasi are.

101 The Pnár or Jaintias ("Syntong" is a slightly opprobious designation,
175 used by the Plateau-Khasi for these, their eastern neighbours) look back

[14] Schmidt (1906).

[553] [15] Strangeness, because Austria was much in the news at the time of her birth, during the last world war; — a fact which illustrates the Khasi peculiarity to use either all by inventions as names for children, or to adapt such, from the Khasi point of view, outlandish words like: "Ka Austria" or "Ka Mediterranean Sea" as names for their children.

[16] Lyngdoh (1957).

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmaker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

249 173 [115] my informants at Padu), in the year 1933, is said to have begun the cultivation of yam (*shniw*) and millets (*knei*) in the then uncultivated slopes. He and his people used to be, on this account, ridiculed as monkeys (*shrieh*). The Nonglamin clan took later to pan-leaf-, and arecanut-cultivation and became one of the richest landowners of the Wár-country. Others followed and imitated them. This clan (*kur*) is now residing at Nongtalang, about ten miles east of Padu in the Wár-Jaintia slopes.

174 184 601 This possibility of a comparatively recent origin of the now economically independent Wár-groups among the Khasi speaking peoples is of importance to the question of some different terms in kinship terminology which the following lists will show.

184 601 Comments on other features in the relationship terminology, bearing on sociological or historical problems of either among the four Khasi speaking groups under discussion, are being hinted at in the text of the lists itself and further discussed in Part Three of the present paper, following the lists of kinship terms.

II. The List of the Kinship Terms

(*u* is the definite article masc. gen.; *ka* — the definite article fem. gen. Both are prefixed to proper nouns and then assume the meaning and function of the English Mr. and Mrs. [or Miss] respectively.)

No.	English	Plateau Khasi	Wár Khasi	Pnár (Jaintia)	Wár Jaintia
1.	To give birth or beget:	*kha* (noun: *jyug kha*)	*kha*	*kha*	*dikun*
1/a.	To give birth to a girl:	*kha kynthei*	*kha kynthei*	*kha kynthai*	*dikun kynthah* (*kinthai*)
1/b.	To give birth to a boy:	*kha shynrang*	*kha shynrang*	*kha shynrang*	*dkun tyrma* (*tyrmai*)
1/c.	To give birth twins:	*kha synrap*	*kha bynrap*	*kha synrap* (or: *arngoi*)	*dikun brap*
2.	Child:	*khynnah* (with *u* and *ka* respectively)	*khun* (or: *khunlung*) (*u* and *ka*)	*khyu ho* (with *u* and *ka*)	*kimboi* (with *u* and *ka*)
2/a.	Childhood:	*ka jinglong khunlung*	*ka jinglong khunlung*	*ka porkhynnah*	*ka kymbotlung*
3.	Puberty of a girl or boy:	*sdang samla* (or: *khynraw*)	*jan samla*	*sdang khyllud*	*khynrong darow*
3/a.	Marriageable girl:	*ka samla* (or: *khynraw*)	*ka samla* (or: *khynraw*)	*ka khyllud*	*ka darow*
3/b.	Marriageable man:	*u samla* (or: *khynraw*)	*u sahla* (or: *khynraw*)	*u khynro*	*u darow*
4.	Woman:	*ka* (or: *ka kynthei*)	*ka* (or: *ka kynthei*)	*ka kynthai*	*ka* (or: *ka kynthaurangbah*)
5.	Man:	*u* (or: *u shynrang*)	*u* (or: *u shynrang*)	*u* (or: *u chynrang*)	*u* (or: *u tyrma rangbah*)
6.	Article of respect: *i* (instead *u* or *ka*)	for both sexes is a term of diminution: used as honorific prefix; but has a contemptuous meaning in the Jaintia dialects			
	Parents:				
7.	Mother:	*i mei* (-addressing); *kmie* (-referring)	*i mei*; — *kmie*	*ka bri*	*ka ma*
8.	Father:	*i pa* (-addressing); *kpa* (-referring)	*i pa*; — *kpa*	*u pa*; *pain*	*u pa*
9.	Siblings and maternal cousins:	*para* (-referring only)	*para*	*pain*	*para*
9/a.	"Brethren"; as in the phrases:	*para lum* — "Brethren Hill (tribesmen)" *para kristan* — "Christian Brethren"	— (?)	— (?)	— (?)

III. Explanations

1. General

Most of my informants were Khasis. The spelling of the terms was checked and corrected by my English-speaking and writing Khasi and Pnar friends, mentioned in para one, to whom thanks are being here once more expressed. All responsibility for spelling mistakes, however, which may have slipped into this list has of course to be borne by me.

Blanks (–) or question marks (?) in one of the columns do not necessarily mean that there is no word used, by the respective group, for the particular term. They more often indicate that my informants did not use, or know, the particular term, or that I failed to enquire about it in a manner sufficiently clear to my informants. This is particularly true of general terms, partly or fully corresponding to English general terms, such as parents or grand-parents, or the terms No. 9(a and b, 11, 11(a, 19-21, and 26, which were partly explained to me, by Khasi friends in Shillong, where I stayed some time after completion of field-work during the rainy season. Hence I could no more return for verification to the little accessible War-villages in the steep southern slopes. Although I am planning to utilize a future opportunity for such checking up, I am yet publishing the present results in the hope that they may thus become accessible to field-workers among other S. E.-Asiatic, and especially Austro-Asiatic speaking peoples.

All terms which are equal for both sexes (cf. Nos. 10, 11, 18, 19, etc.) are used with no gad a respectively. These underlining prepared articles, as also the homonyms i are specially mentioned in the list, only if this is essential for the understanding of the respective terms as in Nos. 3-5, 7, 8, or 10.

2. Special

Term No. 1 — to give birth or beget (bha) signifies also relation on the paternal side as in para the (paternal cousin No. 7(c), in contradistinction to para ka. 7(b, (b) — cousin of the clan), i. e. maternal cousin, since the clan is a matrilineal unit. This usage of the word the appears also significantly in the terms (1(a, 17, 19(b, 20, 22, 23 and, as an integral part of the Khasi kinship terminology, renders it highly improbable that the Khasi matrilineal system could have originated in ignorance of the biological function of the father. It is a significant feature in the matrilineal social system.

The terms 1 to 13 refer to unmarried but biologically marriageable youths. It will be noted that there are (and were in 1950) no indications of puberty-rites for either girls or boys. There is also no child-marriage among Khasis. The use of special terms for mature, unmarried youths is therefore significant.

Term 4 — i ga hunnerbi article, is at the same time indicator of diminutive *, which is remarkable for two reasons: (firstly) the diminutive is used for the oldest and most respected family members, the the diminutive

* Cousin Rabin (1955), p. 65.

21: Khronika E-4,5 (1950) 1953 ART Khasi ART

of father to Ramsim (for the kar, etc.), (usually) the youngest, not the eldest, daughter performs the family rites and inherits the family property [illegible]. Even in cases where there is no woman to inherit, the youngest, not the eldest son inherits [illegible]. Among the conservatively matrilineal Pnar (Jaintia) this term of diminution is, however, earlier at times a somewhat contemptuous meaning, though the moment is strongly in force also among them. The underdrest position of this honorific term of diminution is thus significant (comp. term 9/c among Pnar and infra.) [illegible]

Term 7 — *mother* (*i mai*) — The *pnin i mai* among Khasi and War Khasi signifies particular reverence (supra : term 4). The classificatory character of the term has been discussed by Chattopadhyay [illegible].

Term 9/f — *hep* for all younger siblings, cousins and even other young kith does not indicate the consideration which the terms 9/d — *dong* for elder sisters and female cousins, or 9/e — *bah* for their male equivalents indicate. The term *ses* (9/a among Pnar) stands here, as generally, for elder and implies a honorific meaning (comp. term 4 supra and term 11/a infra). [illegible]

Terms 10/a and 8 show that husband and wife address each other by equal terms and do in no way indicate anything like an inferior position of either wives or husbands of which I did also not find any indications otherwise. It may here be mentioned that property rights even in newly established estates, vest in women and are inherited by women, — not generally men. [illegible]

Term 11/d — *ka khaw khadduh* — the youngest daughter whose important position in Khasi religious ritual, social organization and inheritance law has already been referred to sub term 4 and described in detail elsewhere [illegible]. The affectionate character of this term finds vivid expression in the abbreviation *ka dud*, which I heard from sisters and the father of a youngest daughter. [illegible]

Term 11/e — *mei sam* (mother's elder sister). The word *sam* (elder) here has a definitely honorific character, although the *mei khynnah* — the mother's younger sister (term 11/f) may be the heir of Epi's ancestral property. This contradiction corresponds to the peculiar significance of terms 4, 9/d and especially 11/d (supra). [illegible]

Terms 12, 13, 13/a, 14, 15/a, 15/b, and the terms for cousins 13, 14, 13/a, 13/b, 13 show, the term 7 — *mother* (supra), classificatory character. The restriction on cross-cousin marriage is of different nature, according as to whether they belong to different households, or not, as has been discussed by Chattopadhyay [illegible]. [illegible]

Term 16/a — *ka* (mother's brother's wife) is basically the same as term 15 — *ka kha* (father's sister) [illegible] though the latter is qualified by the additional term *kha* (begetting, birth) which signifies personal relationship (see : term 9/a, 4).

[illegible] (1934), pp. 63, seq. ; Carrier (1956), p. 17.
[illegible] (1956), p. 55.
Chattopadhyay (1953), pp. 55, seq.
[illegible] (1934), pp. 91, seq. and Carrier (1956), pp. 17, seq.
Chattopadhyay (1953), pp. 56, seq. 3.
As detail discussed by Chattopadhyay (1953), p. 57.

Terms 19 and 20 — *pawa kor* and *pawa kho*, the former for all cousins and half-siblings on the mother's and the latter for those on the father's side, show the consciousness of the matrilineal clan-affinity and the patrilineal biological relationship through their classificatory subdivision, which is also true of

Terms 21, 21a and 21b — the *kaiba* are cross-cousins.

Terms 21b shows special consideration for the elder paternal male cousin of the first degree, who is addressed as *kak* whilst the elder maternal male cousin of the first degree is addressed as *kong*; like the elder female cousins on both sides.

Terms 23, 23a, 23b, — *kaiw* for grandchildren would appear to mean dog's children. It has, however, been pointed out to me, by Khasi friends, that the Khasi word for dog is *kaw*; not *kaiw*. The Pnar (Jaintia) pronunciation *ki kaw* for grandchildren, and the occasionally occurring designation of great-grandchildren as "rats children" (term 24) and of great-great-grandchildren as "rats children" (term 25), however, would appear rather to suggest the derivation of *kaiw* *kaiw* from *kaw* — dog, than from a meaningless separate root.

Term 26 — *kiwa* means (i. e. rats children) for great-great-grandchildren is used among Nahwa Khasi families. Bradfield considers with Cameron, E. Lunet de Lajonquière, Kubahata and Kuhnert the possibility that the name of the Wa has been derived from rats[*]. This is a hill tribe, speaking a language with some similarity to the Mon-Khmer group[*] (to which also the Khasi language belongs). The Wa are living not very far from the possible homeland of the Khasi around the region of S. China, S. Siam and Indo-China. If a parallel should here be assumed, the two complementary Khasi terms No. 27 (dogs children) and 25 (rats children) may appear to be formed on the basis of analogy with the term "rats children" as tribal self-designation. Another explanation, however, of this unusual kinship-term which was given to me by a Khasi friend, contented that such generation, seen from the ancestral parent's point of view, is as numerous as the young of the respective varieties of animals.

Term 28 — *kiwa kaw* (rats children) *ramnaiw* — see term 26 (begins).

Term 29 — *o ki* — *o kong* as a favourite term for the maternal uncle and the husbands of the elder sisters and elder female cousins on the maternal side, illustrates the great respect shown to male relatives on the mother's side by adding the masculine preposition *o* to the word *kong*, which generally signifies elder female maternal relatives, but, in this case, their husbands (comp. term 31a). This usage of the term is reminiscent of the Brahmin ceremonies preferred for male maternal ancestors, instead of for mothers, grandmothers, etc. It also tallies with my observations, otherwise obtained[*]

[*] Bradfield (1907), pp. 6, 7.

[*] Bradfield (1907), p. xvi, though he draws the exclusion of the Wa into the Mon-Khmer group.

[*] Cameron (1898), p. 14; (1901-02), pp. 6, 7, 7; (1901-2), pp. 72, 88, etc.

21: Ehrenfels E-4,5 (1950) 1953 ART Khasi ART

namely that male members of a matrilineal clan copy, among Khasi as among other matrilineal groups in India, a position which, far from unenviable, is a very high one in itself and doubly fortified by the respect which to the same male family member is being shown (a) in his capacity as the father of his children in his wife's clan (comp. term 4 of the list), and (b) in that of the maternal uncle (comp. terms 16, 16 a, 16 b and 28 and 29).

The terms 33 b, c, g, h, have classificatory character.

The term 33 e — *u kong* for the husband's elder sister's husband is one of the exceptions of the rule that *kong* generally signifies an honoured elder female relative but, as in this case, also her husband (comp. term 26).

Term 36 a *pa* (father) in its usage among Pnar (Jaintia), also for stepfather is significant. A Pnar child has no legal clan-relationship with his/her biological father, who belongs to another (matrilineal) clan than the child and mother. Yet the honorific term *pa* is, among Pnar, also applied to a stepfather, although neither legal, nor biological but merely sociological relationship via the mother, exists between stepfather and child. This use of the word *pa* then seems to emphasize both, firstly the integration of the matrilineal family structure, by making an unrelated stepfather to be looked upon as father, owing to his relationship with Ego's mother and, secondly the important sociological and psychological position of the father in this matrilineal family structure which appears to go back to an old tradition among the Pnar.

Term 41 — *para* 'very low'[*] (lowcaste hill tribals) are characteristically termed *para* (Brethren), although they are different in many respects, from the Khasi, yet considered as definitely nearer related than all other neighbours, grouped under the

Term 43 — *dibar* (photograph)[*], — a term which varies in emotional content from contempt pure and simple to an attitude, somewhat parallel to what ordinary English usage would generally associate with the expression "continental". Marriages of Khasi girls and boys with *dibar* do occur, though infinitely more than marriages of (superially educated) Khasi girls with (educated) *para* 'very low', Nepalese, Garhlia or Chinese boys. One of the reasons which is usually being given for this preference for non-Indians is by no means colour-prejudice, but the taboo on either beef or pork which most *dibar kong*[*] (Indians, Hindus or Muslims, respectively) observe; a taboo which they generally extend to their Khasi wives, thus preventing them from enjoying two favourite Khasi national dishes. Another more psychological reason is the overbearing treatment of wives, which is generally ascribed to *dibar kong*, more even than to *dibar ki*[*]. It is in this connection

[*] Literally: Lowcaste Humans (hill).

[*] With Dibar are here meant the photographs as such, — not the Khasi Dibar or Ghari class which are mostly, if not always, descended from ancestors who had been captured in the plains and brought to the Khasi Hills, comp. Gurdon (1907), pp. 30 ff and Ehrenfels (1950 E), pp. 19/20.

[*] Literally: Photograph Man.

[*] Literally: Photograph Men.

signifest that the reason, given for the comparatively frequent marriages of Khasi girls with Chinese boys is not the greater physical resemblance which a doubt exists between the average Khasi and the average Chinese (Dikhar)as compared to the average non-Chinese Dikhar (Indians, Europeans, African, Americans and others) but the belief that Chinese husbands are less demanding in their attitudes towards their wives, than are other Dikhar.

REPORT ON RURAL ECONOMIC SURVEY IN UNITED KHASI-JAINTIA HILLS.

CHAPTER I

Introduction

1.1 **Objective.**—Consequent upon operations on trade emerging in the border markets after partition, the economic condition of the people living in the border areas of the United Khasi-Jaintia Hills district adjoining East Pakistan, suffered a serious set back. There was demand from the people all over the border areas for adequate relief as well as rehabilitation of their shattered economy. From time to time Government took up various relief measures but, for adopting a planned programme of relief and rehabilitation in an integrated and sustained manner, the need for a comprehensive economic survey of the district with special emphasis on the border area, came to the forefront. Accordingly at the instance of Government of Assam, the Department of Economics and Statistics addressed itself to the task of launching an economic survey in the district.

The programme consisted of an intensive study of the conditions in selected villages and was designed to meet the following objectives:— (i) To obtain a broad picture of the rural economic conditions in the district and in particular, to provide factual data on the various aspects of agriculture and farm economics e.g., land tenure, use and distribution of agricultural holdings and farms, fragmentation, income and expenditure, occupation and the like. Data should be collected also on the competitive and influences which play subsidiary roles in the economy of the district. (ii) Special emphasis need be given on border areas, in order to bring to light the measure of suffering of the border people as a result of partition and to suggest various long and short term measures for ameliorating the condition of the border people. (iii) The survey should adequately cover the Community Development areas also in order that it becomes feasible to make an assessment of the impact of the community development programmes on the socio-economic life of the people in these areas.

1.2 **Coverage and Period.**—The field work of the survey was started on 28th February, 1958 and was completed by the middle of July, 1958 thus requiring nearly four and a half months.

1.3 **Design of the Survey.**—For a study of border economy a purposive selection of ten villages in the border area, which were known to be important from the point of view of production and distributive trade in pre-partition days was made. Similarly for Project area a total of eight villages two from each of the four blocks in the district—where intensive development programmes were taken up, were selected. These villages were selected by the Project Officers themselves. Apart from these, a random sample of ten villages from all over the district were taken. Thus a total of 28 villages all over district—10 from border area, 8 from project area and 10 from general areas selected for

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

1.3 Investigation. The sample size of ten villages only out of a total 1002 villages in the general area of the district is indeed, very small, which nevertheless had to be restricted to commensurate with the availability of time and field staff at our disposal and in consideration of the difficulty of conducting field work in the remote interiors of a hill district, where communication facilities lack so badly.

1.4 Plan of Investigation.—Plan of investigation may be considered as consisting of two parts viz.—

(1) The general investigation was confined mainly to the border area. This consisted in holding meeting of villagers in the selected villages, discussing the various important problems facing them and recording their suggestions for improving their lot. Apart from meeting the villagers, problems were also discussed with the important people of the locality.

Schedules—Schedule I.—This schedule was meant for collection of village statistics relating to various facilities offered by the village, namely—communication, health, recreation, education, marketing, cottage industries and the like.

Schedule II.—This was the most important schedule for collection of information on the economic aspect of the families. This was canvassed in all the families of the selected villages. The more important item on which information were collected through this schedule were :—

Block V: Demographic particulars of household, occupational and employment pattern.

Block VI: Household indebtedness.

Block VII: Land-holding and farm.

Block VIII & IX: Implements and Livestock.

Block X & XI: Household expenditure.

Block XII: Receipts and disbursement of the household.

Schedule III.—Listing of household and occupation.

Special Schedule.—This was canvassed in all the households of the villages selected from Community Project areas. This was intended to collect information on adoption by households of various improved agricultural practices advocated through the Community Development programme and for assessment of the extent of public participation and co-operation in developmental works. Information was also collected on agricultural assistance received by households.

19: Assam G-5 (1958) 1963 A87 Khasi A87

1.5 Method of collection of data and field organisation.—For the collection of data personal interview method was adopted. Actual investigation in the villages was done by Inspectors and Primary Investigators of the Department of Economics and Statistics. The District Statistical Officer was put directly in-charge of the investigation. He maintained general supervision, direction and control of their day-to-day work. The officers from headquarters also exercised overall supervision and inspection. Before starting the actual field work, the Director of Statistics, apart from personally visiting the border area and selecting the villages for investigation in consultation with knowledgeable people of the locality, addressed letters to the District Council for rendering all necessary help who in turn instructed all the Members of the District Council and village Headmen to extend their co-operation to the field staff. We take the opportunity of recording here our deep appreciation of the valuable help we received from various officials and non-officials in the conduct of the survey.

It is obvious that the success of such a survey under specially difficult situations faced in the inaccessible and backward hilly areas, entirely depends on the intellectual honesty and technical efficiency of the field staff as well as on their ability to call up the required extent of co-operation from all concerned. Though we could reasonably claim a high standard as regards the former category of requirement, the latter nevertheless presented itself as a tremendously difficult task as, the villagers—almost free from any tax or other obligation to the government—could not but receive this work with feelings of suspicion and scented in it a device to levy some taxes or other by the government, in as much as it did involve some questions relating to land, income and expenditure, etc. It cost us a large amount of effort to keep the fond of suspicion at bay. We had to hold meetings in each village and devote considerable time to convince the people that this was in no way connected with any taxation scheme.

1.6 Interim Report.—In view of the urgency of the border problem, particularly the setting up of Border Rehabilitation Committee for suggesting ways and means for rehabilitation of the border economy, we hastened to submit an interim report on border economy to the committee on the basis of investigation completed only in five border villages in April, 1968.

CHAPTER VI

LAND

6.1 The total area covered by the sample villages is not available for want of relevant village records as for district is not enforceable surveyed for settlement purposes. Hence no alternative on matters of land and land utilisation pertaining to a family we had to depend entirely on the accounts given by family concerned. However, every care was taken to ensure reliability to a number of cross accounts of land given by families were verified by actual measurements. In most cases they were found to tally approximately. To simplify matters land referred hereafter relates only to cultivated land.

HOLDING

6.2 "Holding" usually means the land over which the individual or family has permanent and heritable right of occupancy. Due to peculiar land tenure system prevailing in this district, an account of which has already been given in the introductory chapter, the definition had to be modified to fit in with the system obtaining in the district and accordingly the holding of a individual or family was meant to comprise of all lands held as own property or held under Raj Tyoma or under settlement through District Council.

The total area covered by land holdings of all sizes in the Border area, Project area and General area were 2066.40 acres, 1891.42 acres and 613.24 acres respectively with 1056, 847 and 184 families in the respective samples. The average size of holding per family works out respectively as 1.9 acres, 2.2 acres, and 3.3 acres in Border area, Project area and General area and holding per head 1.48 acres, 0.65 acres and 0.7 acres respectively. The real situation on the structure of family holdings, however, will be better understood from an examination of the distribution of the holdings according to their size as presented in the following table.

[Box 1-3 Contact the Archival Manuscripts]

PREFACE.

This book is an attempt to give a systematic account of the Khasi people, their manners and customs, their ethnological affinities, their laws and institutions, their religious beliefs, their folk-lore, their theories as to their origin, and their language.

This account would perhaps have assumed a more elaborate and ambitious form were it not that the author has been able to give to it only the scanty leisure of a busy district officer. He has been somewhat hampered by the fact that his work forms part of a series of official publications issued at the expense of the Government of Eastern Bengal and Assam, and that it had to be completed within a prescribed period of time.

The author gladly takes this opportunity to record his grateful thanks to many kind friends who have helped him either with actual contributions to his material, or with not less valued suggestions and criticism. The arrangement of the subjects discussed is due to Sir Bampfylde Fuller, lately Lieutenant-Governor of the Province, whose kindly interest in the Khasis will long be remembered by them with affectionate gratitude. The Introduction is from the accomplished pen of Sir Charles Lyall, to whom the author is also indebted for much other help and encou-

[illegible]

INTRODUCTION.

121 In 1902 Sir Bampfylde Fuller, then Chief Commissioner
122 of Assam, proposed, and the Government of India
sanctioned, the preparation of a series of monographs
on the more important tribes and castes of the Province,
of which this volume is the first. They were to be
undertaken by writers who had had special and
intimate experience of the races to be described, the
accounts of earlier observers being at the same time
studied and incorporated; a uniform scheme of treat-
ment was laid down which was to be adhered to in each
monograph, and certain limits of size were prescribed.

124 Major Gurdon, the author of the following pages, who
is also, as Superintendent of Ethnography in Assam,
editor of the whole series, has enjoyed a long and close
acquaintance with the Khasi race, whose institutions
he has here undertaken to describe. Thoroughly
familiar with their language, he has for three years been
in charge as Deputy-Commissioner of the district where
they dwell, continually moving among them, and visit-
ing every part of the Khasi hill region which is called
123 by their name. The administration of the Khasi and
124 Jaintia Hills is an exceptionally interesting field of
official responsibility. About half of the district,
including the country around the capital, Shillong, is
outside the limits of British India, consisting of a
coll[illegible]n of small states in political relations, regulated
by [illegible] with the Government of India, which enjoy

Dr Gordon G-3 (no date) 1904 AR7 Khasi AR7

193 high. Interrogative adverbs may either precede or follow the verb, e.g., *mant phi ano or phi ano ano*, where do you come from.[1]

121 10. *Conclusion.*—I have endeavoured to note down briefly above some of what seem to be the more prominent features of Khasi Ethnology, reserving a more detailed account of the Khasis for the monograph which is under preparation. In publishing this brief account, it is my hope that it may attract criticism by persons who are more familiar with the Khasis than myself, and it is my earnest desire that if experts who are acquainted with the Ethnology of the province of Burma and of that great country comprising the valleys of the Mekong and the Menam, find any points of resemblance between Khasi Ethnology and that of those regions, they will kindly bring these points to my notice, so that perhaps a clue may be found to the origin of the Khasis, which is at present so obscure.

113 [1] In the compilation of this brief notice of the Khasi language, I beg to acknowledge my indebtedness to Dr. Grierson's Modern Khasi Grammar, the Revd. H. Roberts's Khasi Grammar, and to Nissor Singh's "Note on the Study of the Khasi language."—P. R. T. G.

9. Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

On the STONE MONUMENTS *of the* KHASI HILL TRIBES, *and on some of the Peculiar Rites and Customs of the People.* By Major H. H. GODWIN-AUSTEN, F.R.G.S., Deputy Superintendent Topographical Survey of India.

121 THE increasing interest that is taken at the present day in ethnology and the history of man in past and present ages, more particularly in the customs of semi-civilised races in distant quarters of the world as compared with the state of those races who dwelt in Europe in early historic times, has led me to put together the information I obtained regarding the people of the Khāsi Hill tracts. Their customs are peculiar, and the fact that they are among the very few who erect at the present day monolithic monuments, is alone of great interest.

This has not escaped the attention of different travellers, 122 officers of the Indian service and others who have visited that quarter of the Bengal Presidency, and from time to time papers have been published; these are scattered through a number of periodicals, and in no case is a complete record of these Hill people to be found.

Notices on the Garos and Khāsis, as well as many of the other tribes on the north-eastern frontier of Bengal, are generally very short, in some instances mislead, and in some cases do the peo- 123 ple, savages though they be, but little justice; in truth, there is very much to admire in these Hill people, they are in many ways, socially and physically, far above their Bengāli neighbours of the plains; intercourse with them is, in consequence, much pleasanter, easier, and has far greater interest; innate honesty and truth in their manners of dealing often crop out, more especially in villages well within the hills, where contact with the people of the plains is of rare occurrence.

I shall notice the best of these papers having reference to 101 tribes inhabiting the range of hills running west to east, south of Assam, from the sharp southern bend of the Brahmaputra up to the Kopili and Diyung river, in long. 92 deg. 45 min., a length of some one hundred and sixty-five miles.

114 In the "Asiatic Researches," vol. iii, published so far back as 1792, is a very interesting paper on the Gāros, by Mr. John 113 Eliot; his travels, however, did not extend so far to the east as the Khāsias.

The Rev. A. B. Lish, a missionary of Cherra Poonjee, published an account of the Khāsias in the "Calcutta Christian Observer" for 1838, he gives an account of their mode of breaking eggs for omens, etc.

Neither in M'Cosh's "Topography of Assam," or in Robinson's "Assam," is any newer or better information afforded concerning

[p. 1]

KHASI KINSHIP AND SOCIAL ORGANISATION

BY

PROF. K. P. CHATTOPADHYAY.

Introduction

114 In a paper on Khasi marriage rules Prof. Hodson has tried
121 to explain the special features of the Khasi kinship terms and marriage rules on the hypothesis of a former dual division of Khasi Society, and certain new social forms which came into operation when the dual society broke up (1).

Hodson used for his work, the kinship terms noted in the Assam Census Report (2), Gordon's work on Khasis (3) and a dictionary by U. Nissoring. A full list of Khasi kinship terms was published by Rai Bahadur S. C. Roy shortly afterwards (4). The list is stated to have been compiled with the help of the ex-Siem of Cherra, on the genealogical method. The genealogies have not however been printed, and detailed notes are not available.

Recently the writer of this paper proceeded to the village of Mawphlang, the head-quarters of the Khasi State of this name and collected a certain amount of data to discuss this
C92 problem. The village is situated to the southwest of Shillong,
[36] at a distance of sixteen miles, and has preserved the old customs to a fair extent. It is ruled over by a lyngdoh or priest-chief, assisted by four myntris. At the time of the visit, the lyngdoh was away, suspended by the Political Agent for misgovernment, and the powers of the State were vested in the council of myntris. The senior myntri U Suba Rai, who is an old man

191 Post-Graduate students of the Department of Anthropology of the University of Calcutta are expected to do a certain amount of field work for practical training. In 1940 a Khasi village was studied by us, the students of the Post-Graduate class, as part of our training, under the guidance of Prof. R. P. Chattopadhyay, the Head of the Department of Anthropology, whom we have
192 to thank also for the photographs used for this paper. This note on Khasi house structure is based on our work in the village of
193 Mawphlang, the headquarters of the Khasi State of the same, in the Khasi Hills, Assam. Our studies included a survey of the village and its house types. Particular attention was paid to the structure of the old type of Khasi house.

193 Gurdon in his book on the Khasis of Assam describes the Khasi hut as elliptical in shape. But in Mawphlang we found that they can be more strictly said to be "U"-shaped, in ground plan the bend of the "U" being the front, the two parallel arms the sides, and a straight line connecting the two ends of the two arms of the "U" the rear. We found this to be the type of most of the old houses of Mawphlang village. As is well known it is the custom among Khasis for the women of a family to live together, until the number of members increases so much that they cannot be provided with rooms in a single house. Then new houses are built. It is usual for a married couple with children to put up a separate

[illegible]

SOCIAL GROUPINGS AMONG THE KHASIS OF ASSAM

by [illegible]

Dept. of Anthropology, Govt. of India

Calcutta

(Received on [illegible] October, 1957)

Introduction

THE Khasis, who inhabit the United Khasi and Jaintia Hills district of Assam, are matrilineal. Like the Garos, they are matrilocal to residence. Exclusive ownership over family property is claimed by the Khasi women and the youngest daughter (Ka-Khadduh) who lives permanently in the house of her mother, is the custodian of the family property and the holder of religion (Ka-lut-ka-mawi[1]).

This paper deals with the social groupings, namely, the clan, sub-clan and family, of the Khasis. The materials were collected in 1956 from Mawphlang, Cherrapunji and Mawlah and Mawsmai villages further south of the Khasi State.

Clan-system

In the language of the Khasi, the prefix *Ka* is usually used before the name of a woman or any object belonging to a woman (or considered feminine). The use of *Ka* as a prefix before the name of each social group is suggested to have bearing on Khasi matrility. *Kur* is not a very expressive and much now for a clan. *Kaiam*, which is supposed to have sprung from the women *Dong yaid ne ka Kyndiah*[2] is more exact. Similarly, *Ka-Ki'jak* and *Ka-Sing* denote the sub-clan and family respectively.

IV. THE PLACE OF THE KHASI IN THE WORLD.

By

Dorbi Roy

(1) The Khasi country lies in the hills of the province of Assam in North East India. Khasi clans are exogamous and matrilineal, and the Khasis speak a Mon-Khmer language.

(2) In speaking of the place of the Khasi in the world I intend to explain the Khasi's own view of his relation to other peoples of the world.*

(3) The Khasi is very conscious of his importance. He says a Khasi claims to be the centre of the world. The Khasi has acquired such a feeling of self-importance from his great confidence in himself; and this confidence he has derived from the position in which his relationship-terminology represents him as standing with respect to himself and the world around him. Or, rather, his relationship terms and language are an expression of his attitude and notions.

(4) The Khasi says—Ka Pawn (mother)

[illegible] The center of it is occupied a Khasi (Dobbins).

the husband. Whichever side is *jaw ka rwiang* (lit. whose power is less strong, less able to resist the evil) will suffer death. The word *rwiang* means more than literally 'fortune.' The word *rwiang* goes with *rngiew* and the two are coupled together as *ka Rngiew ka Rwiang*. *Rngiew* is the person, the man's 'soul'. '*Rwiang*' is the controlling power produced by that person, hence *jaw ka rwiang* means the power controlling the man's person becoming easy of being conquered or subdued. (*Jaw* = easy, pliable.)

In a word, the Khasi's idea of himself is that he stands in the middle of the world. We do not find terms in the language of peoples with the family system to express relation of relationship to the extent that we have in the Khasi vocabulary. Some of the other languages content themselves with terms for father, mother, uncle, aunt, cousin. They have no words to differentiate the classificatory-descriptive system of terms showing relationship with mother, mother's elder and younger sisters (*mai*, *mai ses*, *mai ual*); father and his elder and younger brothers (*kpa*, *kpa ses*, *kap ual*) and father's brother's children (*pawa blei*), father's mother (*mai blei*), mother's mother (*mai ual*,) wife's brother (*kynsai*), husband's brother (*long*), and so on. We find in the Khasi sociology, departments of social organization indicating the attitude towards life which is peculiar to the Khasi. The terms are not mere names but serve to show well-defined groups based on an idea of their special functions. As Dr. R. R. Marett says, "Language, and everything

also that we do in instinct with a plus; and for the student of religion or of human culture in way of its forms, to account for that plus is the sum and substance of his task.....Whereas, then, there is likelihood that any a posteriori reason existed for believing that in-breeding makes for sterility, if indeed it be true in fact at all, there might well have been an a priori conviction to reach the same effect based simply on a fear that to tamper with the fountain-head of human vitality would conceive same is to dry up." The Khasi stands in the world an exponent in his rule of life, and he says "*ang bud lyrwiah*", that is, endogamy is forbidden and if it should ever be committed it will render life defiled and corrupt. He says this out of the fear of the knowledge that any act of carelessness in the prohibited area of the source of human life and vitality, which is in the Khasi phrase "*ling briw*" (*ling* is to be or become, *briw* is man, i.e., to be or become man), will make that source of human life to dry up. He he says, "*Kah I jaid I khong*" (*Kah* is exterminated; *jaidbriad*, species; *khong* = man).

In refutation of such sayings as that the Khasi has no rules of marriage, I shall quote the most sacred pronouncement the Khasi when two persons, the man and the woman, are initiated into that state. Calling upon the name of God the Khasi says—"*U Lei shaw briw man briw, u lei ne ka 'lei synduai'*, (God who creates man and in the source of human life, God who keeps, sustains, preserves), "*Ka ka Jhai ka jong, Ka*

PREFACE

The purpose of this monograph is to present theoretical problems of Garo and Khasi social organization in relation to those of other matrilineal systems. In fact, the study of these two matrilineal systems has led me to enquire into many other matrilineal systems, as will appear throughout my discussion in Parts I and II. As a result, I think I have reached certain conclusions of theoretical interest concerning matrilineal systems as a whole; these are presented in the last part of the book.

Map 1. — Location of the Garo Hills and the Khasi-Jaintia Hills.

From the beginning of my field work, my interest lay in a comparative study of the two systems, not in preparing a complete monograph of the cultures of the two peoples. I used the period of my field research in working among the two peoples alternately, so that I could constantly check from one field to the other as new problems appeared.

The period of my field work was very limited (October, 1959-February, 1960). I did not know the vernacular of either the Garo or the Khasi (Since Garo language has much commonness with Tibetan language which I was used to read and speak, I could quickly get used to follow their speech during my field work, but I failed to do so in Khasi language). I employed altogether five local English-speaking interpreters (out of the five, three were pagan, and all had relatives in the villages where I worked). But I already had experience in studying the economic and social organization of other hill peoples in Assam, having carried out two years (1955-1957) field work among tribes in Tripura State and among the Tangkul Nagas in Manipur State, as also among Himalayan peoples. This all helped me a great deal in my work among the Garo and the Khasi, and is one of the reasons why I could collect such a considerable amount of data, in spite of the above mentioned handicaps of my actual field work. (Later on, I carried out field research for four months among the Nayar of Kerala, to provide further data for comparative study.

The Garo and the Khasi present very different structures from each other. In order to present a more effective picture of each structure, I have used different ways of presentation, each of which brings out certain important theoretical implications. The emphasis is laid accordingly upon different features: in the case of the Garo, it is the marriage system in relation to the village community; in the case of the Khasi, it is variation in marriage forms related to the structure of descent groups.

I wish to express my profound gratitude, first of all, to the Ella Wagner Foundation in Stockholm, by whose generous grant the field work of this study was carried out, and next to Professor C. Loveman, who has consistently encouraged me to complete the manuscript and has very kindly given me this opportunity for publication. I am greatly indebted also to Professor Fred Eggan, Professor Raymond Firth, Professor Meyer Fortes, Professor C. von Fürer-Haimendorf, Dr. E. R. Leach, Dr. Audrey Richards, and Professor D. M. Schneider for much stimulating discussion and helpful comment on the theoretical problems of this study.

I am grateful for invitations from the Department of Anthropology, University of Chicago (1959-1960) and the Department of Cultural Anthropology, School of Oriental and African Studies, University of London (1960-1961), as also for an association with the Department

Chapter III

VILLAGE COMMUNITY

As models of a Khasi village community, I have taken my data for the discussion presented in this chapter from two villages situated in the Kuhadhinong area, Sohkynilah and Kongton, with comparative data from Sholla and Jutinga villages.

Sohkynilah and Kongton are situated in one of the most secluded areas of the Khasi Hills and the economy is shifting cultivation, with millet as its main product. Only a few Christians are found, most of the population are pagans. Sholla is situated on the southern border of the Khasi Hills, adjacent to Pakistan. Jutinga is in the North Cachar Hills, surrounded by partitional tribes, such as the Zemi-Naga, the Kuki and the Cachares. The economy of both villages is partitional and orange cultivation. In Sholla, Hindu, Christian and pagan are found among the villagers almost in the same proportions, while the Jutinga villagers are all Christian. The two Kuhadhinong villages, Sholla and Jutinga, differ from one another not only in their religious and economic aspects, but in court culture, dialect and political organization as well. (Additional information concerning Sholla and Jutinga is given in Appendix.) Sholla and Jutinga are unique among Khasi villages and quite sophisticated, having been developed under a trading economy, with considerable contacts with other peoples, including Hindus. I selected these villages in order to ascertain how far the structural principle which operates in the Kuhadhinong villages can be found to act also in totally different economic and environmental situations.

I. Setting and Economic Background of Sohkyndah and Kongton

Sohkyndah and Kongton are villages of the Kadashimong,[1] one of the areas under the Chera Chief. The Kadashimong is situated on the southern slope of the Khasi Hills, in what is called War country. These two villages are situated at the farthest point from both Shella, the centre bordered by the plain, and Cherrapunjee, the seat of the Chera Chief, one of the centres of the upland Khasi Hills. The people at Cherrapunjee say that these villages are one of the most backward parts of the Khasi Hills. They correspond to Rongkhoi in the Garo Hills, as they lie in the innermost parts and more traditional economic and social settings have been preserved there than in other villages. These are also the reasons why I selected these villages as my field.

It is nine miles to Sohkyndah from Cherrapunjee, crossing two deep valleys towards the east. Kongton is located at the heart of the mountain ranges, ten miles from Cherrapunjee, towards the north-east. It is about twelve miles from Sohkyndah to Kongton, and the way leads through one of the most difficult passes, where even villagers seldom travel. In December, 1955, Sohkyndah was a community of 38 households (List 6), and Kongton of 60 households (List 9). The settlements of both villages are clustered in the southern depressions of a mountain, not far from the summit, a typical location of Khasi villages. Sohkyndah has poor soil, covered with plenty of pieces of stones. The yield therefore is very poor. On the other hand, Kongton, a much older village, enjoys fertile soil, and is one of the most prosperous communities in the Kadashimong.

The major economy of both villages is shifting cultivation. We have already seen, in the chapters on the Garo, the fundamental technique of "Burning cultivation." The difference between the Garo and the Khasi shifting cultivation are to be found in two aspects: one is the nature of the crops and the other is the type of landownership. In this area, the main crop is millet, while that of the Garo is rice. Besides the shifting cultivation, the Khasi have pan-leaf gardens and sometimes pineapple gardens, though on a small scale and not in every household. The most important feature of Khasi shifting cultivation is the development of private ownership. In the tribals areas in Assam, such private ownership of the jhum field is quite an

1. Kadashimong is the name of a group of villages. Its literal meaning is "twelve villages," and it comprises the following villages: Sohkyndah, Kymmen, Sharkuwan, Shwdiat, Shwiang, Kongton, Shwiang, Kyllapathar, Pilar, Tawkaw, Umpyrang, and Umpaw. (Khasi spelling follows the customary usage in Chera Hills.)

DISCUSSION OF MATRILINEAL SYSTEMS

As a concluding discussion, I shall here deal with the main theoretical problems concerning matrilineal systems as a whole; at the same time, I shall attempt to make clear the structural alignment of the Garo and Khasi systems, together with other matrilineal systems. For this purpose, my analysis is focused particularly on the structure and composition of the descent group, with relation to residential patterns. For my argument it is very important to keep in mind the concept of the descent group. In this discussion, I use the term 'descent group' as constituting a 'corporate property group'; more properly, perhaps, this unit should be called the matrilineal inheritance group. Though the discussion deals mainly with matrilineal systems, it also touches upon theoretically important aspects of unilineal systems as a whole.[1]

1. The analysis of matrilineal descent groups has been greatly advanced since Andrew Lyall's outstanding contribution on the comparative study of Central Pacific matrilineal societies (Richard, 1950). Among all, the recent publication of Matrilineal Kinship (Edited by Schneider and Gough, 1961) is a remarkable achievement on the landmark in the series of studies in this field.

My analysis presented here, however, has been developed quite independently from that of Matrilineal Kinship (when the latter was published, the manuscript of this essay had already been sent to the publisher. The publication of this book is extremely delayed). Though some of the issues touch upon the discussions presented in these volumes, particularly of David Schneider's Introduction, the angle of my analysis differs considerably from theirs. Firstly, my analysis is primarily concerned with the differences in the structures of matrilineal systems, which Schneider's discussion intends to bring out the distinctive features of matrilineal descent groups in contrast to that of patrilineal systems; again it is also quite different from that of Kathleen Gough, the major concern of which is the correlation between productivity (or ecology) and social structures and also from that of David Schneider's cross-cultural comparison by using a large ethnographic sample. Secondly, my argument develops from the analysis of the Garo and Khasi social structures, while in that of Schneider, these two matrilineal societies seem to fall in a rather exceptional case; in fact they are excluded from a set of the collection of matrilineal systems, on which his theory is based.

15: Nakano E.S (1955-1956) 1957 AR7 Khasi AR7 Garo AR5

I

The discussion of Parts I and II reveals that the social structures of the Garo and the Khasi differ greatly. Similarity is found only at the level of the minimum criteria of matrilineal systems: the basic succession rules of mother-daughter, mother's brother-sister's son, and the fact that property is owned by the women, but the controlling power and authority over it are in the hands of the men.

One of the most outstanding structural differences between the two lies in the composition of a property group: the property group of the Khasi is formed by a descent group at a shallow generation depth, while that of the Garo is maintained by the cooperation of two local lineages, each of which represents a localized lineage group. Hence the descent group of the former tends to have stronger solidarity, whereas the latter tends to be weakened in its solidarity.

In a broad framework, in terms of social organization, the Garo fall structurally into a category based on the moiety arrangement, in which patrilineal systems, such as the Murngin, and the Karieri, etc., are also to be found. Theoretically, this type of mechanism is operative in either matrilineal or patrilineal systems by the exchange of men in the former and the exchange of women in the latter.

On the other hand, the Khasi system presents more outstanding features of a type which is generally accepted as belonging to matrilineal systems. However, the basic structural traits of this system may also be found among patrilineal systems, in terms of relatively stronger descent group solidarity.

Fig. 10. — Succession Lines of Female and Male in the Matrilineal Descent System.

Lines A and B may include succession and brother-hood relation respectively, the numbers of classificatory category variations in these succession points depend on each matrilineal system.

Though both matrilineal and patrilineal systems may share such basic structural categories, they differ significantly in the following respects: in matrilineal systems, the ownership of property and the authority over the property group never rest in one person, as in the case of the father-husband of the patrilineal systems, and the succession to these two offices follows the female line (mother-daughter) and the male line (mother's brother-sister's son) as shown in line A and line B in Fig. 10. This duality of office-holding individuals within the succession rule is the intimate cause

of complications and variations in matrilineal systems. The matrilineal system is not a mirror of the patrilineal system; it is a different system in which more complicated mechanisms are involved. This complexity of the matrilineal system is a decided handicap when it comes to meeting radical economic changes. In order to preserve the system, a fairly stable economy is required, with balanced ratio in population and resources. This may be one of the reasons for the rapid disintegration or instability of social organization of matrilineal peoples in the world.

The difficulty of preserving in function both lines *A* and *B* is caused by residential problems—individual marriages which contradict the sibling cohesion. According to my theoretical analysis, there are four alternative ways of resolving such contradictory factors, each case being represented by actual ethnographic samples.[1] Each arrangement represents a different degree of the function of the two lines *A* and *B* in relation to the residential pattern, as following (see Fig. 13):

FIG. 13. — *Central Case of Matrilineages in Relation to Property Groups and Residential Groups.*

The Garo type. The residential type in Northeast India consists of "avoidance marriage." The function of both lines *A* and *B* is equally strong. This is brought by the marriage contract between two local lines, so that it is possible to keep the function of each line against the residential separation of the two lines in one descent group. This type is found at the moment only among the Garo.

1. For this discussion I take only such major matrilineal samples for which ample documentation is available.

19: Nakao E-9 (1953-1954) 1957 AR7 Khasi AR7 *
Garo AR5

devices of the existing system. This does not necessarily imply that such societies have or had the same organization as other matrilineal societies, but I believe this to be an economic and historical product of the existing structure. I do not question the fact that all these societies are subject to a process of change; but it does seem unnecessary to assume that every factor which happens to be missing nowadays, did, in fact, exist in the past.

Summing up the above discussion, the essential structural differences between the Bemba type and other matrilineal systems are found firstly in the internal structure of its property group: "unilateral" contrasting with the "matrilineal" of the Garo, Nayar, Khasi and Ashanti types. Secondly, in the structure of the wider organization of the residential groups the clear matrilineal principle is found to act in the composition of matrilineal groups. The focus of the matrilineal operation is quite opposite to that of the household-lineage type. In the latter the bilateral features are met with at the wider organizational level. In the Bemba type, in spite of bilateral features in the composition of the residential property group, the rigorous matrilineal group conception is found in the wider organization. Unlike the case of the segmentary-lineage type, this matrilineal group does not have necessarily a direct and actual economic basis. Perhaps the scale of the Bemba society is small enough to maintain the matrilineal social system without a definite economic basis.

In conclusion, such terms as "matrilineal" (unilineal) and "bilateral" are simply convenient labels for the preliminary classification; they should not be used as contrasting criteria for classifying social structure. The unilineal principle (matrilineal system) works differently in each given society, producing as I have observed different structures. Again, descent principle and residence (with landholdings or property) are equally important criteria for the analysis of social organization. The prominence of either descent or residence should not be theoretically opposed in the arguments of anthropologists, for different degrees and levels of both factors are involved in each given society.

Finally I should like to note that the five major types of matrilineal systems in relation to the internal structure of the property group, which I presented in this discussion, namely the Garo, the Nayar, the Khasi, the Ashanti and the Bemba types, give theoretical criteria for the analysis. It should not be assumed that all matrilineal systems grouped into the same type present the same structure, but that each possesses the important basic element of its type. Also a system may change from one type to another through important economic changes or migrations: for instance, from the Nayar type to the Ashanti type, or from the Ashanti type to the Bemba type.

13: Nakaso K-5 (1959-1964) 1967 ART Khasi ART

[Jaitinga]

The village was founded in 1919 by Khasi immigrants from the Jaintia Hills. At the entrance of the village, a bust of the founder, Lakhmiking Sachiang, stands facing towards the east; it was erected on the occasion of the celebration of their Golden jubilee, in November 1969. Houses are scattered along the ridge of the mountain to the east and to the west; in the centre is the church. All the inhabitants are Christians. Before the Partition this was one of the most modern and prosperous villages in Assam.

Jaitinga provides a very interesting instance of the Khasi 'colonial' village. It is surrounded by villages of the Kuki, of the Semi-Naga, and of the Cacharee, who constitute the main population of the North Cachar Hills, and who are tribes entirely different from the Khasi, in economy, social organization, language and culture. Therefore, Jaitinga is like an island of Khasi community. I took this village as one of my fields, because I was particularly interested to discover how far the Khasi matrilineal organization is kept up in a community thus situated, surrounded by patrilineal tribes, and considerably modernized by Christianization and economic prosperity; and I was also interested in the process of formation of a new village, in comparison with Rimphoro and Jedipore in the Garo Hills.

Formation of the Present Population of Jaitinga

The first immigrants to Jaitinga.

The main population of Jaitinga, including the founder, originated in Rawa village in the Jaintia Hills, twelve miles away from Jaintiapur, the capital of the then Jaintia Raja. This village is situated on the border of the Jaintia Hills and the East Bengal plain, the location being very similar to that of Dulla, as are their culture and economy. In the later part of the nineteenth century, some members of Rawa village moved to Borkhala, ten miles from Silchar, one of the biggest villages of the then Cacharee king.

These immigrants who came to Borkhala stayed there about fifteen years before they came to Jaitinga. Kiarlem, the first daughter of the founder's sister was born there. In November 1919, some Christian Khasi left Borkhala for Jaitinga, acting on information gathered from a Welsh Mission at Haflong, that the land of present Jaitinga was fertile and fit for their cultivation. They were the first immigrants to Jaitinga. The Government record names the following three persons as the first immigrants to Jaitinga: Sachiang Lakhmiking, Tarsang, and Sachiar Wheels. In fact, according to the data which I collected at Jaitinga, Sachiang Lakhmiking was accompanied by the following persons (the names in brackets indicate the clans):

his wife, Mathew (Thawan);[1]
his brother, Prostish, and Prostish's wife, Sorra (Ryntl);
his sister, Lapiler, and Lapiler's husband, Wheels (Sachiar) with their daughter, Kiarlem, and Wheels's younger brother, Iam;
his friend, Tarsang.

Soon after their settlement, Iam, the brother of Wheels, brought his wife Tylem (Sarem) from Jaintia. Mathew brought her younger sister, Dimilem. Tarsang also came with Lakhmiking afterwards called his wife, Pakeng. But having spent some time there, they left eventually for another place, so that

1. Mathew was a native of the Cherrapunjee area of the Khasi Hills (not of Jaintia like the others). She was a school teacher at Cherrapunjee, and later became a teacher of a school near Jaintiapur, where she married Lakhmiking.

CHAPTER III

The Border Area

3.1 Definition of Border Area.—The term 'border area' although very frequently used does not refer to any well demarcated area. It was, therefore, decided after a joint discussion between the Director of Statistics with the Deputy Commissioner of the district and Subdivisional Officer, Jowai, that area within 10 miles of the Indo-Pak border line would be considered as the 'border area' for the purpose of the present survey. The list of the villages falling in this area was supplied by the Deputy Commissioner and the Subdivisional Officer.

3.2 Condition of the Border Area before partition.—The border area under review then comprised of the southern slopes of the Khasi and Jaintia Hills and a narrow strip of plains adjoining the southern slopes running along the Pakistan border. The area extends roughly over a length of about 120 miles, roughly from Mahadeb on the east to Sonapur on the west thus covering an area of 3,000 sq. miles approximately, comprising of 100 villages inhabited by population of 70 thousands.

Barring the barren and rocky top plateau the slopes are utilized as the production of valuable cash crops on terraced mode. These slopes provide suitable soil and climate for the production crops like oranges, tangerine, betelnut, mango, pineapple and other fruits. The manner of rich yields which such plantations give to the cultivators these slopes were more densely inhabited and intensively cultivated than would appear possible from the topography of the area. Even the most inaccessible spots in the slopes has been converted into rich orchards, signifying the produce was carried by headloads over steep gradients for several miles. Due to steep gradients little other use, except some jhooming here and there, could be made of this area.

Because of the very topography, this land had no natural communication with Indian district now forming part of East Pakistan. Even since immemorial the area had a bordering trade with Indian district. It was a seasonal trade. The cash crops found ready buyers in the people of Indian, from where in turn the people in the border area obtained supplies of rice, fish, vegetables and other necessities of daily life. Thus in pre-partition days this enjoyed a very prosperous and secured economy. The rich heritage in the border area villages which are now listening away, bear eloquent testimony to the past prosperity of the border economy.

With the partition of the country in 1947, trade with the plains of Indian, now forming part of East Pakistan, was restricted. As a result the whole economy of this region was completely disrupted and the enterprise which was founded with activity and abundance was pre-shadowed with stress, poverty and despair. Of the rich economic resources of the border people but the memory is left. Moreover, for want of communication facilities the produce could not be

spective and related has been compiled without knowledge of Professor Chattopadhyay's work, and before he very kindly sent a private copy of this work, which had not been available to me previously.

The present paper offers data on the following subjects:

1. Khasi kinship terms from the Shendal Khasi plateau-area in the Khynriam State, about 20 to 30 miles south-east of Shillong, which are in some minor details different from the Sumphlang data, collected by Chattopadhyay, south-west of Shillong;
2. Comparative data from the War-Khasi;
3. from the plateau-area of Jaintia in the Jaintia* Hills, and
4. from the War-Jaintia;
5. Aspects of the Khasi kinship terms, with special reference to the matrilineal order of society, and to the respective position of women and men there, especially the particular consideration which the biological relationship through the father confers in kinship terminology, in spite of the emphasis on the matrilineal structure in Khasi society (away from No. 1 of the list and its discussion in para 1.0 of the present paper, on p. 396).

The data here collected in field researches to which I was enabled by two Research Grants for comparative studies in matrilineal civilizations of India, given by the Viking Fund Inc. (now: Wenner-Gren Foundation for Anthropological Research) in New York, during the periods 1950-52 and 1954-55. My gratitude to the Foundation for enabling me to carry out these field researches, as well as to the University of Madras, for granting me Sabbatical Leave for the same purpose, is here once more specified.

My research programme was based on the first tentative working hypothesis, laid down in my book "Mother-right in India"[1], but includes also various other aspects of study which have not been pre-planned, or even considered there[2], as for instance also the present comparative study of kinship terms in areas of four Khasi dialects and two special significances in the Khasi matrilineal social system. The material was collected during a five weeks house-to-house study in the recently founded Pamsan Khasi village Mon Syn Jri, during April and May 1956. This village consisted mostly of houses owned by Khasi clan-sisters and inhabited by them, with their families, after they had left the ancestral home in the main village Khynriam, about two miles across the valley on the western side of the new settlement. The ancestral family houses there were in the possession of either the mother, or, if she was no more alive, the youngest daughter of the family, the lai Khasi Khadih[3].

* Jaintia (Pnar or "Synteng") are the Khasi speaking eastern neighbours of the Khasi proper. As among the Khasi, so also among Jaintia the people in the well-planted highlands are in many ways inferior, from their who arrived in the former Jaintia kingdom at the northern begin, with Bengali get-ments of the East Pakistan frontier — the so-called War-country, which economy is mostly based on garden gardening.

Ic Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

[Not in Library]

INTRODUCTION.

In 1905 Sir Bampfylde Fuller, then Chief Commissioner of Assam, proposed, and the Government of India sanctioned, the preparation of a series of monographs on the more important tribes and castes of the Province, of which this volume is the first. They were to be undertaken by writers who had had special and intimate experience of the races to be described, the accounts of earlier observers being at the same time studied and incorporated; a uniform scheme of treatment was laid down which was to be adhered to in each monograph, and certain limits of size were prescribed.

Major Gordon, the author of the following pages, who is also, as Superintendent of Ethnography in Assam, editor of the whole series, has enjoyed a long and close acquaintance with the Khasi race, whose institutions he has here undertaken to describe. Thoroughly familiar with their language, he has for three years been in charge as Deputy-Commissioner of the district where they dwell, continually moving among them, and visiting every part of the beautiful region which is called by their name. The administration of the Khasi and Jaintia Hills is an exceptionally interesting field of official responsibility. About half of the district, including the country around the capital, Shillong, is outside the limits of British India, consisting of a collection of small states in political relations, regulated by treaty with the Government of India, which enjoy

9. Godwin-Austen G-S (no date) 1872 A87 Khasi A87

On the STONE MONUMENTS *of the* KHASI HILL TRIBES, *and on some of the Frontier Rites and Customs of the People.* By Major H. H. GODWIN-AUSTEN, F.R.G.S., Deputy Superintendent Topographical Survey of India.

121 THE increasing interest that is taken at the present day in ethnology and the history of man in past and present ages, more particularly in the customs of semi-civilised races in distant quarters of the world as compared with the state of those races who dwelt in Europe in early historic times, has led me to put together the information I obtained regarding the people of the Khasi Hill tracts. Their customs are peculiar, and the fact that they are among the very few who erect at the present day monolithic monuments, is alone of great interest.

This has not escaped the attention of different travellers, officers of the Indian service and others who have visited that quarter of the Bengal Presidency, and from time to time papers have been published; these are scattered through a number of periodicals, and in no case is a complete record of these Hill people to be found.

Notices on the Garos and Khásis, as well as many of the other tribes on the north-eastern frontier of Bengal, are generally very short, in some instances misleading, and in some cases do the people, savages though they be, but little justice; in truth, there is very much to admire in these Hill people, they are in many ways, socially and physically, far above their Bengáli neighbours of the plains; intercourse with them is, in consequence, much pleasanter, easier, and has far greater interest; innate honesty and truth in their manners of dealing often crop out, more especially in villages well within the hills, where contact with the people of the plains is of rare occurrence.

I shall notice the best of these papers having reference to tribes inhabiting the range of hills running west to east, south of Assam, from the sharp southern bend of the Brahmaputra up to the Kopili and Diyung river, in long. 92 deg. 45 min., a length of some one hundred and sixty-five miles.

In the "Asiatic Researches," vol. iii, published so far back as 1792, is a very interesting paper on the Gáros, by Mr. John Eliot; his travels, however, did not extend so far to the east as the Khásias.

The Rev. A. B. Lish, a missionary of Cherra Poonjee, published an account of the Khásias in the "Calcutta Christian Observer" for 1839, he gives an account of their mode of breaking eggs for omens, etc.

Neither in M'Cosh's "Topography of Assam," or in Robinson's "Assam," is any newer or better information afforded concerning

K. Chattopadhyay 2-4, 5 (no date) 1941 AR7 Khasi AR7

nearly seventy years of age, spoke English a little, and kindly agreed to help by acting as introducer as well as interpreter. The Chowkidar of the bungalow, a Christian Khasi who spoke Hindi tolerably well was however our principal interpreter. Before proceeding to the village, I had studied Roberts' Khasi Grammar and also learnt simple sentences in Khasi necessary for collecting genealogies, kinship terms and connected details, like the inheritance of the ancestral house and lands. This portion of the data was collected entirely through questions and answers in Khasi; the other details were obtained with the help of myntri U Subu Rai and his friends and the Chowkidar, U Hudrington. On important points however, some checking was made, by simple questions in Khasi, which involved definite answers in the affirmative or negative. My students who had accompanied me for training in field studies, repeated some of my observations, in my presence and with my help and guidance.

My best thanks are due to Mr. K. Cantlie, Deputy Commissioner, Khasi and Jaintia Hills, for furnishing me with the letter of introduction to U Subu Rai and for other facilities. His published notes on Khasi law, especially the chapters on inheritance also proved to be of great value in carrying out the enquiries (5). In the subsequent portions of this article, references to the works of Gurdon and Cantlie, will be indicated merely by (G) and (CN) respectively.

15: Nakane E-5 (1955-1956) 1967 AR? Khasi AR? •
Garo AR?

From the beginning of my field work, my interest lay in a comparative study of the two systems, not in preparing a complete monograph of the cultures of the two peoples. I used the period of my field research in working among the two peoples alternately, so that I could constantly check from one field to the other as new problems appeared.

The period of my field work was very limited (October, 1955-February, 1956). I did not know the vernacular of either the Garo or the Khasi (Since Garo language has much commonness with Tibetan language which I was used to read and speak, I could quickly get used to follow their speech during my field work, but I failed to do so in Khasi language). I employed altogether five local English-speaking interpreters (out of the five, three were pagan, and all had relatives in the villages where I worked). But I already had experience in studying the economic and social organization of other hill peoples in Assam, having carried out two years (1953-1955) field work among tribes in Tripura State and among the Tangkul Nagas in Manipur State, as also among Himalayan peoples. This all helped me a great deal in my work among the Garo and the Khasi, and is one of the reasons why I could collect such a considerable amount of *data*, in spite of the above mentioned handicaps of my actual field work. (Later on, I carried out field research for four months among the Nayar of Kerala, to provide further *data* for comparative study.

The Garo and the Khasi present very different structures from each other. In order to present a more effective picture of each structure, I have used different ways of presentation, each of which brings out certain important theoretical implications. The emphasis is laid accordingly upon different features: in the case of the Garo, it is the marriage system in relation to the village community; in the case of the Khasi, it is variation in marriage forms related to the structure of descent groups.

I wish to express my profound gratitude, first of all, to the Elin Wagner Foundation in Stockholm, by whose generous grant the field work of this study was carried out, and next to Professor C. Lévi-Strauss, who has consistently encouraged me to complete this manuscript and has very kindly given me this opportunity for publication. I am greatly indebted also to: Professor Fred Eggan, Professor Raymond Firth, Professor Meyer Fortes, Professor C. von Fürer-Haimendorf, Dr. E. R. Leach, Dr. Audrey Richards, and Professor D. M. Schneider for much stimulating discussion and helpful comment on the theoretical problems of this study.

I am grateful for invitations from the Department of Anthropology, University of Chicago (1959-1960) and the Department of Cultural Anthropology, School of Oriental and African Studies, University of London (1960-1961), as also for an association with the Department

15- Nakane E-6 (1950-1956) 1957 ABT Khasi ABT Garo ABT

of Anthropology, London School of Economics and Political Science, which allowed me to give series of lectures on this subject. I received great profit from discussions with staff and students of these institutions in the preparation of the final manuscript. I have a special debt to acknowledge also to Professor Sol Tax, who has afforded me consistent help and encouragement in this work. I also had some interesting discussions with Miss A. Filetis McCormack and Dr. R. Burling each of whom worked in other areas of the Khasi and Garo Hills. I also wish to express my thanks to Mrs. Fürer-Haimendorf of the School of Oriental and African Studies, and Mrs. Hore of London School of Economics for their kind help with the manuscript.

A major acknowledgement also goes to the Wenner-Gren Foundation for Anthropological Research who supported this study, and to the Centre for Advanced Studies in Behavioral Sciences for its hospitality in the summer of 1959 when the first part of this manuscript was prepared.

Finally my most grateful thanks go to the Institute of Oriental Culture, University of Tokyo, which in its generous appreciation of the needs of a social anthropologist has permitted me to have a sufficient period of research abroad to make this and other studies possible.

London, February 1962.

Bibliography

I. Introductory Remarks

[illegible] Professor [illegible] Calcutta University published in [illegible] an analysis of Khasi kinship terms[1] based on eight genealogies which he collected in the Sohpetbneng area, about seven miles south-west of Shillong.[2] He discussed in his paper a previous publication by Professor Kroeber[3] where special features of certain Khasi kinship terms are held to prove the pre-existence of a dual system in a non-Hindu Khasi social order and he quotes also the late Rai Bahadur S. C. Roy's work on Khasi kinship[4] and lists of Eastern relationship terms, contained in "Census of India Reports"[5] and Khasi terms in U. Nissan Singh's "Khasi-English Dictionary"[6], P. R. T. Gurdon's monograph on the Khasi[7] and in Sir Gurdo Carrick's "Notes on Khasi Law"[8]. Discussing these previously published papers, Chattopadhyay arrives at the conclusion that Kroeber's hypothesis of a dual organisation in a hypothetical former Khasi society was not justified[9].

[illegible] The present paper, however, does not enter into discussion of this

[illegible] and edited has been compiled without knowledge of Professor [illegible]'s work, and before he very kindly sent a private copy of this work, which had not been available to me previously.

The present paper offers data on the following subjects:

1. Khasi kinship terms from the Sumdai Khasi phrases-area to the Khynriam-Nongkhlaw area, about 30 to 35 miles south-east of Shillong, which are in some minor details different from the Mawphlang data, collected by Gurdon (1906), south-west of Shillong.
2. Comparative data from the War-Khasi.
3. from the phrases-area of Jowai in the Jaintia* Hills, and
4. from the War-Jaintia.
5. Aspects of the Khasi kinship terms, with special reference to the matrilineal order of society, and to the respective position of women and men therein, especially the particular consideration which the biological relationship through the father receives in kinship terminology, in spite of the emphasis on the matrilineal structure in Khasi society (comp. term No. 1 of the list and its discussion in para. 1.0 of the present paper, on p. 188).

The data were collected in field researches to which I was enabled by two Research Grants for comparative studies in matrilineal civilizations of India, given by the Viking Fund Inc. (now: Wenner-Gren Foundation for Anthropological Research) in New York, during the periods 1950-52 and 1953-55. My gratitude to the foundation for enabling me to carry out these field researches, as well as to the University of Madras, for granting me Sabbatical leave for the same purpose, is here once more recorded.

My research programme was based on the first tentative working hypothesis, laid down in my book "Matriarchy in India"*, but includes also various other aspects of study which have not been pre-planned, or even considered there*, as for instance also the present comparative study of kinship terms in areas of four Khasi dialects and their special significance to the Khasi matrilineal social system. The material was collected during a five weeks house-to-house study in the recently founded Pateng Khasi village Shaw Syn Jri, during April and May 1956. This village consisted mostly of houses, owned by Khasi elder sisters and inhabited by them, with their families, after they had left the ancestral home in the main village Khasiang, about one mile across the valley on the western side of the new settlement. The ancestral family houses there were in the generation of either the mother, or, if she was no more alive, the youngest daughter of the family, the *ka khun khadduh*.*

* Jaintia, (Pnar or "Synteng") are the Khasi speaking eastern neighbours of the Khasi proper. As among the Khasi, so also among Jaintia the people in the cool plateau highlands are in many ways different from those who settled in the tropical rainforests of the southern slopes, now situated just north of the East Pakistan frontier — the so-called War-country, where economy is mainly based on jam-leaf gardening.

* Chinnappa (1951).

* Chinnappa (1950-A), (1950-B), (1950-C), (1950-D), (1950-E), (1950-F), (1951-B).

* Gurdon (1914), pp. 63, seq., Cowlan (1906), p. 10.

It will have to be recalled that the Khasi are a matriarchal agricultural people, pre-Hindu, and the advent of the Bengali in the early decade of the 19th century, represent under democratically ruling clan, as Khasi princes and chieftains and speaking an Austro-Asiatic language.* These physical affinities are considerably mangled and quite distinct from the Tibetan speaking plains-Indians, — but not from the other mountaineers of Assam, Tripal and even Burmah or China, with whom they fall to be more closely related, as with the Indian photographs, as some of the tribal designations in the following lists of terms for Non-Khasi neighbor groups. Go to or against Fig. (1), (2) and (3)(a).

In the collection of the material, I was hampered by my inability to pick up the Khasi language sufficiently quickly, for conversation without the help of an interpreter, but on the other hand greatly eased by generous and voluntary assistance on the part of several Khasi friends, especially U Ekkman Singh, the President, Cultivator Union, Khasi and Jaintia Hills and his (Khasi) wife, Ka Juanta *, who offered me hospitality in their home at Nan-Kyn Jri, during my stay there. Dr. H. Lyngdoh, Shillong, the author of detailed accounts on Khasi religious ceremonial and institutions *, U Jashon Roy, a leading Pnar gentleman of Jowai in the Jaintia Hills, Ka Khin Lyn, Principal, Govt. Basic Education Training Centre, Raibi, Shillong, Ka Kongmen, Shillong, and U Tarrel Roy, Pnar Student (still), and a number of hospitable Wip-Khasi and Wip-Jaintia peasant cultivators in the southern slopes of the Khasi and Jaintia Hills, especially from the villages Shaitar and Dalu, also helped me greatly in my work. My thanks are due to all of them.

The data, submitted and briefly described in this paper were then collected in four different areas:

1. The Southwestern corner of the Khasi-Hills (plateau area),
2. The southern slopes of the Khasi Hills, the "Wip-Khasi country" between the Khasi plateau proper and the northern boundary of East Pakistan,
3. The central plateau of the Jaintia Hills, round its capital market Jowai, and
4. The southern slopes of the Jaintia Hills, the "Wip-Jaintia country" between Jowai and a section of the northern boundary of East Pakistan, further to the East than group 2.

Slightly different Khasi dialects are spoken in these four regions, Jaintia (Pnar or "Syntong") and Wip-Jaintia being more akin to each other, similarly as Plateau-Khasi and Wip-Khasi are.

The Pnar or Jaintian ("Syntong" is a slightly opprobrious designation, used by the Plateau-Khasi for them, their nearest neighbours) look back

* [illegible]

* In recent, bitterness feeling was much in the news at the time of her death, during the first world war — a fact which illustrates the Khasi geniality to an extent not for strangers as names for children, or to adopt such, from the Khasi point of view, outlandish words like "Ka Andrew" or "Ka Mediterranean Sea" as names for their children.

* Lyngdoh (1957).

How Do the People Accept These Facts?

a) The Fear among the People

[171] [172] A great fear of these murderers who are in the service of the Ulen permeates the whole life of the Ghasi; this feeling is still especially strong in the kingdoms of Cherre, Ejilles, and Bongkrem. Naturally they guard themselves well from people who are supposed to be in possession of a devil snake and they often do not even dare to speak their names out loud for fear that misfortune could befall them. Many of them are certainly known by the people; others are just guessed at. We tried very hard to get a photograph of such people who are considered to be Ulen owners; but we met only with complete refusal from them. Their bad consciences probably make them fearful. I was able to photograph the house of a woman Ulen worshipper in Mauerel, several [illegible] miles away from Cherre. In contrast to most of the Ghasi huts, indications of wealth were evident on the outside, since the hut was covered with tin. In spite of all my pleas the woman could not be prevailed upon to have herself photographed. Such an idea frightened her so that she cried out loud: "O, we are investigated so much!"

[173] [174] At night a Ghasi does not really trust himself alone outside of his hut. If he is overtaken by darkness on the way home, he may be seen hurrying towards his home, singing or calling in a loud voice from time to time to give himself courage. A single man, even if he does not have to go far from his hut to work is not likely to go without his big knife — ka wait — under his arm to protect himself against all possible attacks. The people usually go together (in groups)

society." Among the mentioned Central Bantu, Richards says that the determining factor in residence at marriage is the marriage payment in the type of goods and services which the bridegroom gives (Richards, 1950, p. 124). However, the Khasi have no such custom in the marriage contract, it is therefore out of the question to explain the two types of residence in this way. In the case of the Khasi, the determining factor is the type of marriage with relation to the rule of inheritance and ownership of property, which is closely related to the structure of the ing. Khasi marriages can be divided into two categories i.e., marriage with an heiress and with a non-heiress. Marriages with an heiress must be uxorilocal. This accounts for category 1 or 3 of the household pattern. On the other hand, marriages with a non-heiress become neolocal and correspond to category 2 of the household unit.

IV. Marriage and the Household

A man married to an heiress, usually lives with his wife's parents and her unmarried or divorced brothers and sisters. For a man, life after marriage under such circumstances require great adjustment and endurance. The husband's status is especially weak when a male member of the wife's kin lives in the same household. The management of property and all economic activities are entirely controlled by the authority (wife's brother or maternal uncle) of the ing. The husband works in the wife's field under constant supervision from this authority. Both economic activities and domestic affairs are always under the management of this authority. The children have more attachment to, and are more obedient to, the maternal uncle than to the father. The tie between the uncle and the nephew is so strong that the father is rather like an additional member of the household. He is the last person to be introduced to visitors.

This family system is clearly reflected in the daily behaviour. When we visited the Khasi household of a youngest daughter, if a man (obviously the husband) came first to greet us, he always said "please wait, my wife (or mother-in-law) is coming." And it was the wife who entertained us, offering tea or pan and discussing matters with us, while her husband remained silent in the corner of the room, or in the next room. If her uncle or brother was there, he would be the person who talked to us, while his niece or sister served us. In such a case, we were seldom introduced to the husband. When I was working at Shella, I happened to stay in such a family. I had hardly any opportunity to talk to the husband during the two weeks of my stay. He left the house very early in the morning and came back late in the evening from the fields. While he was at home, he was

592
591
602
615
[123]

sentiment, in spite of his forming an independent domestic unit. Such a man will use households, the family of orientation and of procreation, says "one leg is in my sister's house and the other is in my wife's," and he feels more at home in his sister's. In villages, whenever a Khasi man in such a position invited me, I was always taken to his sister's (or sister's) house, his *ing*, not to his wife's. There I was warmly welcomed with highest respect by the women of the household as the guest of their uncle (or of their brother), the head of the *ing*. Khasi men whom outsiders often regard as hopeless in their social position, thus enjoy the highest status in their *ing*.

One Khasi gentleman who occupies a fairly high post in the Government, at Haflong, leaving his wife (non-kinsman) and children at Shillong, to my question "when you go to Shillong into which house do you first step," immediately replied, "As soon as I get back to Shillong, I take the way to my sister's home and there take the evening meal with them, enjoying their talk. Then I go to my wife's house where my loving children are waiting." This shows a typical Khasi man's psychology in relation to a family of orientation and of procreation. His first concern on coming back to his homeland is whether his sister and her children are well, since he is the man of authority in that *ing*. He feels much more relaxed in his sister's house where he is held in higher regard and more cared for.

I came across many similar cases. In Jaintia and Shella, such men on returning from their work, often have their evening meal with their sisters though their wives are waiting for them. Furthermore, if they choose to do so, they sleep at their sister's house without even going back to their wife's house. This results in an unstable married life, where a wife has to face a psychological handicap caused by the occasional absence of the husband, in spite of her advantageous position in a matrilineal and uxorilocal system. Many wives worry every day over whether or not their husbands will come to their house at night. And often this concern changes into sadness and loneliness when the husband does not return for several days on end. The wife knows her husband is at his sister's house in the same village. But she has no right to fetch her husband home. As in Western social dancing, the women have to wait till their partners come. During my field work I often came across these lonely women, just waiting for their husbands, each knowing he was only a few houses away. Though these Khasi women never show their feelings of loneliness in the presence of others, I, being a female anthropologist, was often told of the sadness of their married life. The situation of these women can be more easily understood if we remember the process of the segmentation of the *ing*, which separates each married woman from her descent group, her natal *ing*.

[123]

nearly seventy years of age, spoke English a little, and kindly agreed to help by acting as introducer as well as interpreter. The Chowkidar of the bungalow, a Christian Khasi who spoke Hindi tolerably well was however our principal interpreter. Before proceeding to the village, I had studied Roberts' Khasi Grammar and also learnt simple sentences in Khasi necessary for collecting genealogies, kinship terms and connected details, into the inheritance of the ancestral house and lands. This portion of the data was collected entirely through questions and answers in Khasi; the other details were obtained with the help of myself, U Soba Rai and his friends and the Chowkidar, U Blahrington. On important points however, some checking was made, by simple questions in Khasi, which involved definite answers in the affirmative or negative. My students who had accompanied me for training in field studies, separated some of my observations, in my presence and with my help and guidance.

My best thanks are due to Mr. E. Gantlin, Deputy Commissioner, Khasi and Jaintia Hills, for furnishing me with the letter of introduction to U Soba Rai and for other facilities. His published views on Khasi law, especially the chapters on inheritance also proved to be of great value in carrying out the enquiries (I). In the subsequent portions of this article, references to the works of Gurdon and Gantlin, will be indicated merely by (G) and (CN) respectively.

[p. 1]

CHAPTER I

According to traditions preserved by the local people, the Longkhit clan were the first settlers in Mawphlang. The Lyngkhoe were invited to come and settle as the Longkhit coming priests to perform proper worship for their village. Other clans came here and settled in the State. These old clans are known as Khadar Kur. Myntris are elected from the following four clans—Longkhit, Khar Shiang, Khar Bunai and Khar Sohlia. The above traditions of the origin of the settlement were furnished by the myntri U Sohn Bai, his sister's husband U Alimon and others. The list of Khadar Kur furnished by the myntri is noted below :— 101 (124)

(1) Longkhit.	(2) Lyngkhoe.	(3) Khar Shiang.
(4) Khar Bunai	(5) Khar Sohlia.	(6) Khar Phanneng.
(7) Khar Kynnin.	(8) Khar Sohkhar.	(9) Marbaniang.
(10) Khar Narbi.	(11) Khar Mawphlang.	(12) Khar Syntiew.

The genealogy of myntri U Sohn Bai, of myntri U Onong Singh and others are shown at the end of this chapter. In collecting kinship terms, three questions were asked of the informant : 125 601

(i). What is the relationship of B to the informant A (and of A to B). This is shown in the tables as the kinship term.

(ii). What the informant A called B (and conversely). This is shown in the tables as the term of address.

(iii). How the informant A referred to the relationship of B to C, another relative. This is shown as the term of reference.

121 From the beginning of my field work, my interest lay in a comparative study of the two systems, not in preparing a complete monograph of the cultures of the two peoples. I used the period of my field research in working among the two peoples alternately, so that I could constantly check from one field to the other as new problems appeared.

122 The period of my field work was very limited (October, 1956–February, 1958). I did not know the vernacular of either the Garo or the Khasi (Since Garo language has much commonness with Tibetan language which I was used to read and speak, I could quickly get used to follow their speech during my field work, but I failed to do so in Khasi language). I employed altogether five local English-speaking interpreters (out of the five, three were pagan, and all had relatives in the villages where I worked). But I already had experience in studying the economic and social organization of other hill peoples in Assam, having carried out two years (1955–1957) field work among tribes in Tripura State and among the Tangkhul Nagas in Manipur State, as also among Himalayan peoples. This all helped me a great deal in my work among the Garo and the Khasi, and is one of the reasons why I could collect such a considerable amount of data, in spite of the above mentioned handicaps of my actual field work. (Later on, I carried out field research for four months among the Nayar of Kerala, to provide further data for comparative study.

123 The Garo and the Khasi present very different structures from each other. In order to present a more effective picture of each structure, I have used different ways of presentation, each of which brings out certain important theoretical implications. The emphasis is laid accordingly upon different features: in the case of the Garo, it is the marriage system in relation to the village community; in the case of the Khasi, it is variation in marriage forms related to the structure of descent groups.

124 I wish to express my profound gratitude, first of all, to the Ella Wagner Foundation in Stockholm, by whose generous grant the field work of this study was carried out, and next to Professor C. Lévi-Strauss, who has consistently encouraged me to complete this manuscript and has very kindly given me this opportunity for publication. I am greatly indebted also to: Professor Fred Eggan, Professor Raymond Firth, Professor Meyer Fortes, Professor C. von Fürer-Haimendorf, Dr. E. R. Leach, Dr. Audrey Richards, and Professor D. M. Schneider for much stimulating discussion and helpful comment on the theoretical problems of this study.

I am grateful for invitations from the Department of Anthropology, University of Chicago (1959–1960) and the Department of Cultural Anthropology, School of Oriental and African Studies, University of London (1960–1961), as also for an association with the Department

12: Nakano E-5 (1955-1956) 1967 A87 Khasi A87

necessary. The chances of acquiring a piece of land nowadays are small, except for very successful men, and usually the size of the plot is only just enough to maintain one household. When this land is passed on to the next generation, the youngest daughter will hold the title to it. This fact tends to exclude married older sisters from the right to use the land, since it is not sufficient for more than one household. Thus the ultimogeniture succession rule seems to have developed more sharply and to have encouraged limited inheritance in conjunction with the shortage of land. 178 623 623

This tendency creates unbalance in the economy of the households within a community. It is a usual picture in Khasi villages, for the bigger and well-built houses to be occupied by the youngest daughter's family, while the older sisters reside in poor huts. Youngest daughters are usually landowners, while their older sisters have often to become day-labourers after their marriage, unless their husbands are capable men, or their fathers wealthy enough to give them some share of their acquired property. On the whole, the variations at present between rich and poor are considerable in a Khasi community, in comparison with that of the Garo, where the economic condition of each household in a village is more or less similar. These differences are not only a matter of economic organization but arise from the nature of each social structure. 178 189 623 628 556 [171]

The economic and social patterns of Sohkynduh and Kongton are very similar, but their dialects are slightly different: my interpreter, who came from Cherrapunjo, could work quite well at Sohkynduh, but at Kongton he found some difficulty, especially with the speech of the old men, and with their religious expressions. The head man of Kongton, who was quite accustomed to the Cherra dialect, acted as an interpreter for us. Such differences in dialect in the Khasi Hills are common phenomena, it is said that every valley has its own dialect. Differences are found not only in speaking, but also, to a certain extent, in culture and in social usages. 197 [124]

II. Village Endogamy

One of the outstanding features of Khasi social organization is the predominant tendency of endogamy on the level of the village, which contrasts with the structural orientation of the Garo village exogamy. This is closely connected with the distributions of clans and the nature of the descent groups. 582 621 [171]

The Khasi population consists of a number of *kur*, matrilineal clans, whose members consider themselves to be descended from a common ancestress. The members of the same *kur* have a common 614 [765] [769]

[illegible] Explanations

1. General

Most of my informants were illiterate. The spelling of the terms was checked and corrected by my English-speaking and writing Khasi and Pnar friends, mentioned in para 1a, to whom thanks are being here once more expressed. All responsibility for spelling mistakes, however, which may have slipped into this list, is of course to be borne by me.

Blanks (—) or question marks (?) in one of the columns do not necessarily mean that there is no word used, by the respective group, for the particular term. They more often indicate that my informants did not use, or know, the particular term, or that I failed to enquire about it in a manner sufficiently clear to my informants. This is particularly true of general terms, partly or fully corresponding to English general terms, such as parents or grand-parents, or the terms No. 1(a) and 4, 13, 15(a), 19-20, and 28, which were partly explained to me, by Khasi friends in Shillong, where I stayed some time after completion of field-work during the rainy season. Hence I could no more return for verification to the little accessible War-villages on the steep southern slopes. Although I am planning to utilize a future opportunity for such checking up, I am yet publishing the present results in the hope that they may then become accessible to field-workers among other N. E.-Assam, and especially Austro-Asiatic speaking peoples.

All terms which are equal for both sexes (cf. Nos. 10, 11, 18, 19, etc.) are used with *ka* and *u* respectively. These sex-overcoming proposed articles, as also the honorific *i* are specially mentioned in the list, only if this is essential for the understanding of the respective terms as in Nos. 3-5, 7, 8, or 10.

2. Special

Term No. 1 — *to give birth to* (*ngeh*) signifies also relation on the paternal side as in *pawa kha* (paternal cousins No. 5(c)), in contradistinction to *pawa ka*, 9(b), 26 (female of the clan), i.e. maternal cousin, since the clan is a matrilineal unit. This usage of the word *ngeh* appears also significantly in the terms 15(a), 17, 20(b), 25, 32, 33 and, as an integral part of the Khasi kinship terminology, renders it highly improbable that the Khasi matrilineal system could have originated in ignorance of the biological function of the father. It is a significant feature in the matrilineal social system.

The terms 1 to 3/9 refer to unmarried but biologically marriageable youths. It will be noted that there are (any) none in 1914) no indications of puberty-rites for either girls or boys. There is also no child-marriage among Khasi. The use of special terms for mature, unmarried youths is therefore significant.

Term 6 — *i* as honorific suffix, is at the same time indicative of diminution [illegible], which is remarkable for two reasons: (firstly) the diminution is used for the oldest and most respected family members, like the diminution

[illegible] Nongpoh Statist (1926), p. 49.

[p. 3]

CHAPTER I

According to traditions preserved by the local people, the Iangtiah clan were the first settlers in Mawphlang. The Lyngkhie were invited to come and settle on the Iangtiahs wanted priests to perform proper worship for their village. Other clans came later and settled in the State. These old clans are known as Khadar Kur. Myntris are elected from the following four clans—Iangtiah, Khar Shiing, Khar Hynni and Khar Sohlia. The clans traditions of the origin of the settlement were furnished by the myntri U Sohn Rai, his sister's husband U Alisan and others. The list of Khadar Kur furnished by the myntri is noted below :— 101 [124]

(1) Iangtiah.	(2) Lyngkhi.	(3) Khar Shiing.
(4) Khar Hynni	(5) Khar Sohlia.	(6) Khar Phonnap.
(7) Khar Kynsai.	(8) Khar Sohkhar.	(9) Morbasiang.
(10) Khar Narbi.	(11) Khar Mawphlang.	(12) Khar Syntiew.

The genealogy of myntri U Sohn Rai, of myntri U Gong Singh and others are shown at the end of this chapter. In collecting kinship terms, three questions were asked of the informant : 125 601

(i). What is the relationship of B to the informant A (and of A to B). This is shown in the tables as the kinship term.

(ii). What the informant A called B (and conversely). This is shown in the tables as the term of address.

(iii). How the informant A referred to the relationship of B to C, another relative. This is shown as the term of reference.

CHAPTER IV

Result of the survey

4.1 **Distribution of sample.**—It has already been mentioned in Chapter I that purposive selection of ten villages from border area, eight villages from the proper area and a random selection of ten villages from the general area, were made for intensive investigation. 125 128

It is not our intention to dilute this Chapter on the specific levels of individual villages. Some common salient features of the villages relating to the situation of the villages, diseases occurring there and marketing, communication, educational and medical facilities obtainable in those villages are briefly described below for the purpose of giving intelligence into the condition of the sample villages.

The following table shows the group-wise distribution of the sample villages, their location by thana and subdivision and the number of families inhabiting each village at the time of the survey.

TABLE B-I

Sample villages in United K. & J. Hills and their location 621

Group	Name of village	Thana	Subdivision	No. of families
(1)	(2)	(3)	(4)	(5)
Border area—	1. Lumthiang	Jowai	Jowai	64
	2. Amki	Dowki	Do	19
	3. Syndai	Do	Do	155
	4. Dawang	Do	Do	104
	5. Lumkhar	Do	Do	20
	6. Nongpi	Chiang	Shillong	210
	7. Shadawng	Do	Do	66
	8. Mawlai	Do	Do	196

CHAPTER V

Population and Occupation

The following table shows the number of families and population of the sample villages in the different village groups.

162
161
125
621

TABLE C-1

	Border area	Project area	General area
1	2	3	4
No. of villages ..	19	8	10
No. of families ..	1,086	647	184
No. of persons	5,674	2,963	902
Average no. of families per village.	108	81	18
Average no. of persons per village.	301·9	370·8	90·2
Average no. of persons per family.	5·6	4·6	4·9

The population in the first two groups of villages is much more than in the third group because important villages were intentionally selected from border and project areas. The figures may not truely reflect the difference in the average size of villages in these areas.

The population in the selected villages were compared with the 1951 census figures. But it was found that the two sets of figures are not strictly comparable due to changes in the names and boundaries of the villages and emigrations. A note on this study is included in the appendix. [128]

*162 •125 161 621

5.2: The following table shows the classification of population by age and sex in the three areas:—

Age and Sex Composition of Population

Age Group	Border area			Project area			General area		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Below 5 yrs.	293	328	621 (16·90)	290	294	584 (20·83)	77	87	164 (18·18)
2. 5 to below 15 yrs.	435	450	885 (24·09)	260	373	733 (25·49)	127	112	239 (26·50)
3. 15 to below 65 yrs.	1025	1077	2102 (57·21)	722	862	1584 (53·42)	238	256	494 (54·76)
4. 65 yrs. & above	26	40	66 (1·80)	16	18	34 (1·15)	3	2	5 (0·56)
Total	1779	1904	3674 (100·00)	1417	1548	2965 (100·00)	445	457	902 (100·00)
No. of females per 1,000 males	..	1076	..	..	..	1092	..	..	940

It is seen that the population under 15 years of age in the border area, project area and general area were respectively 41 per cent, 45 per cent and 45 per cent of the total population in these areas, while that under age group 'between 15 to 65 years', constituted respectively 57 per cent, 53 per cents 55 per cent of the population in the three areas.

It is evident that population of females was as a whole greater than that of male in border area and project area and less in general area. The number of females per 1,000 males in border area, project area and general area were respectively 1,076, 1,092 and 940 against the 1951 census figure of 983 females per 1,000 males in the rural areas of the district of United K-J. Hills.

5.3: The following table shows the classification of population by religion.

TABLE C-3

*162 779

Classification of Population by Religion

Area	Tribal religion	Christianity	Hinduism	Other religion	Total
(1)	(2)	(3)	(4)	(5)	(6)
1. Border area	1766 (48·07)	1410 (38·33)	483 (13·15)	15 (0.41)	3674 (100·00)
2. Project area	811 (27·35)	2013 (67.89)	141 (4.76)	0.00	2965 (100·00)
3. General area	310 (34·26)	571 (63·30)	22 (2·44)	0.00	903 (100·00)

[433] [563] Population following Hinduism and other religion in the border area comprises mostly of displaced persons from East Pakistan following trade and business as their means of livelihood, while those in the general and project areas are mainly the Nepalies who are generally engaged in cattle rearing and agriculture.

*162 871 125 In border area and project area the percentage of literates is worked out at 24 and 31 respectively –a comparatively high figure for a rural area. This, however, cannot be regarded as a true index of literacy in the rural area of the district for the fact that villages from border area and project area were purposively selected almost all of which by virtue of their bigness in size and location in vantage points, happened to possess at least one school for quite a long time. The average picture for the district as a whole is brought out by the percentage of literates in the general area which is only 17. A comparison of this figure with that of 1951 census for the rural areas of the district which is only 12 per cent shows that during the last eight years there has been an increase in the percentage of literates.

As will be seen from table above the proportion of literates among males is higher than that among females throughout the district.

Economic Status

*162 434 5.5: The following table shows the number of persons in the sample villages by sex and economic status.

*162 434 464 From the above table it is seen that the proportion of earners in the Border area, Project area and General area are respectively 50 per cent, 48 per cent and 55 per cent of the corresponding total population. Thus each earner has to support himself and roughly one dependent. Thus the burden of dependency is not very heavy in the district. This is because of the fact that men, women and adolescents all join the labour force. Number of women engaged wholly on domestic works is few. Only in big families having a number of women, one or two of them are engaged in domestic works, otherwise the Khasi women attend to the domestic works in addition to their work in the field.

From table G 5·1 in the appendix it will be seen that respectively 4·7 per cent, 7.8 per cent and 10.2 per cent of the earners in Border area, Project area and General area are below 15 years of age.

5·6—Attempt was made to study the employment position in the selected villages. For this purpose the following definition of employed and unemployed persons was adopted.

• 125 464 Persons working for pay or profit on one day during a period of 30 days preceding the date of enquiry would be classified as employed. Those who did not work on any day during the last 30 days, may be employed or unemployed. The person is unemployed if—

(i) He who was without a job for the whole reference period.

(ii) Who was seeking one, and

(iii) Who was in a position to accept job if offered one.

A person is also unemployed if he did not work because of his protracted illness, believed that no work was available, or was expecting to return to a job from which he had been indefinitely laid off.

On the other hand a person is employed if he had a job, although temporarily absent from work during the reference period due to illness, vacation, industrial disputes or being laid off temporarily. Also a person would be considered employed if he was waiting to take up a new job which he had been offered or to start a new business.

by employees who comprise over 22 per cent, 13 per cent and 9 per cent respectively. It may be noted that the large number of families who engaged agricultural labourers on daily basis as and when necessary were not classed as 'employers'. 162* 164 [125]

Occupation

3.8: In the following tables attempt has been made to depict the occupational distribution of the population. 463 125

As agriculture is the principal occupation of the majority of the villagers the following schemes of classification of occupation, has been adopted—

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

0125
463

Families have been classified into three main classes, *viz.*

(1) Wholly agricultural

(2) Partly agricultural

(a) Agriculture as principal occupation

(b) Agriculture as subsidiary occupation.

(3) Independent of Agriculture.

5.9: The following table shows the distribution of families by occupational type in the three village groups :—

TABLE C·8

*162
463

Occupational distribution of families in different village groups

Occupational type	Border area	P. C. to total no. of families (house hold)	Project area	P. C. to total no. of families	General area	P.C. to total
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Wholly agricultural	511	50·80	394	60·90	128	69·57
2. Partly agricultural—						
(a) agriculture as principal occupation.	168	16·70	95	14·68	37	20·11
(b) agriculture as subsidiary occupation.	183	18·19	108	16·69	17	9·24
3. Independent of agriculture.	144	14·31	50	7·73	2	1·08
	1006	100·00	647	100·00	184	100·00

125
463

Families have been classified into three main classes, *viz.* :—

(1) Wholly agricultural

(2) Partly agricultural

(a) Agriculture as principal occupation

(b) Agriculture as subsidiary occupation.

(3) Independent of Agriculture.

5.9: The following table shows the distribution of families by occupational type in the three village groups :—

TABLE C·8

*162
463

Occupational distribution of families in different village groups

Occupational type	Border area	P. C. to total no. of families (house hold)	Project area	P. C. to total no. of families	General area	P.C. to total
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Wholly agricultural	511	50·80	394	60·90	128	69·57
2. Partly agricultural—						
(a) agriculture as principal occupation.	168	16·70	95	14·68	37	20·11
(b) agriculture as subsidiary occupation.	183	18·19	108	16·69	17	9·24
3. Independent of agriculture.	144	14·31	50	7·73	2	1·08
	1006	100·00	647	100·00	184	100·00

It will be seen that wholly agricultural families, in Border area, Project area and General area are 51, 61 and 70 p. c. respectively of the total families. Classifying the wholly agricultural families and families pursuing agriculture as principal occupation, as predominantly agricultural families—the proportion of such families for Border area, Project area and General area stand at 68 p. c. 76 p.c. and 90 p.c. respectively. Thus it is clear that in the Border area the proportion of predominantly agricultural families is the lowest. The reason for this can be safely ascribed to the set-back received due to closure of markets after partition. A close study of tables C·10 and C.11 below and table C.11.1 at the appendix will bear testimony to the fact that in Border area there is evidence of a shift of occupation from agriculture to non-agricultural enterprise especially labour (non-agricultural). 162* 463

Predominantly agricultural families have been classified into five groups— Non-cultivating owner, owner cultivator, tenants, part-owner and part-tenants and landless agricultural labourers. The number of families and the proportion of each of these groups in the three areas are as follows— 125 241 423 427 463

Apart from private lands, Raj lands possessed by a family and land possessed throug settlement by District Council have been considered as 'land owned' for the purpose of this survey. Tenants usually take in rent from lad-owners only those lands which are possessed by the later as private land or through settlement through District Council. A perusal of tale C 9 given above will show that proportion of tenants are highr in Jowai subdivision which is due to the existence in this subdivisin of some big landholders who are known as zamindars. Majority of the families shown against 'non-cultivating owner' are in fact agricultural labor families who also possess some land but due to some reason or other left it uncultivated. Among owner cultivators, tenants and part-owner ad part-tenant families also there are some whose major income is derivedfrom agricultural labour. Consideration of these two facts along with the number of landless agricultural families goes to show that the proporion of agricultural labourers in the district is rather high. 423 463 427 [125]

TABLE C1·0

Occupational distribution of families whose principal occupation is other than agriculture 162* 463

principal occupation	No. of families					
	Border area		Project area		General area	
	Total	P.C. to total	Total	P.C. to total	Total	P.C. to total
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Non-agricultural labour.	188	57·49	70	44·30	6	31·58
2. Service, profession, etc.	34	10·40	39	24·68	3	15·79
3. Trader.	65	19·88	21	13·29	4	21,05
4. Small scale manufacture & handicraft.	23	7·03	19	12·03	1	2·56
5. Poultry & dairy farming.	7	2·14	..	..	5	26·32
6. Others	10	3·06	9	5·70	...	...
Total ..	327	100·00	158	100·00	19	100·00

511 It is seen that the per family average annual expenditure is Rs.909·00 nP. in Border areas, Rs.1008·00 nP. in Project area and Rs.828·00 nP. in General area. The per family annual net income in the respective area being Rs.852·86 nP., Rs.988·84 nP, and Rs.949·51 nP. it follows that the budget of the average family is deficit in all the areas. [426] This deficit is usually made up either by restricting the consumption expenditure during the lean months of the agricultural year or by taking loans.

221 511 The field work of the survey was started during the month of February, *i.e.*, hardly after two months, of harvesting of winter paddy and during the harvesting period of cash crops like orange, betelnut, potatoes, etc. During this period people get money through the sale proceeds and naturally they [114] were tempted to spend comparatively higher amount on food. In fact, it was made clear during investigation that as lean months are approaching when people did not have money to purchase food articles, they used to lead a very austere life. This period is particularly very hard for the Border people because unlike people of other two areas they do not have [128] even paddy in store. As the above figures of annual expenditure of a [125] family were calculated on the basis of information collected for one month preceeding the date of investigation, in respect of food and non-food articles, and for one year in respect of miscellaneous items, there is every likelihood of the average per family expenditure on food and non-food articles being over-estimated.

128 511 As in the case of income, consumption of articles produced at home or at farm as well as those received out of the goods, services and gift and loan were valued in money terms on the basis of the local average retail prices in respect of the commodities concerned. Thus even firewood and other wild vegetables and fishes obtained by fishing were valued in terms of money. Of the total average expenditure on food, the food articles obtained in kind and consumed at home account for about 18 per cent in Border area, 53 per cent in Project area and 57 per cent in General area. Thus the share of food articles obtained in kind and consumed at home to the annual expenditure of a family is very low in Border area. This is natural because they depend almost exclusively on cash crop cultivation.

511 Out of the total expenditure, food account for about 68 per cent in Border area, 67 per cent in Project area and 73 per cent in General area. In all the areas cereals alone took the bulk of the expenditure on food, *i.e.*, 66 per cent, 75 per cent and 81 per cent in the respective areas

It is seen that expenditure on pulses, vegetables and milk are very low. In fact only a few of the Tribal villagers take pulses, milk and vegetables. Rice and fish or meat are the only items of the dishes of most of the villages.

Among non-food articles fuel and light accounted for 6 per cent in Border area, 5 per cent in Project area, and 5 per cent in General area. Khasis are heavy chewers of betelnut and this accounted for 5 per cent of total annual expenditure in border area, 4 per cent in Project area and about 3 per cent in General area while tobacco and tea in tea-stall accounted for about 5 per cent, 4 per cent and 4 per cent respectively of the total annual expenditure in the three areas. Expenditure on liquor

CHAPTER—X

Summary of main findings

• 125 10.1. Twenty-eight villages were selected for the purpose of the survey. Out of the 28 villages selected, 10 from Border area and 8 from Project area were selected purposively while the remaining 10 were selected at random from the entire district which is referred hereafter as general area.

166 Migration from big villages was rare but some migration was reported in respect of small villages.

164 Occurrence of Malaria, influenza and dysentery is a regular phenomenon in the area. Medical facilities were not found satisfactory and
743 as much as 78 per cent of the villages have no dispensary within a
871 radius of five miles. In regard to education, the facilities cannot also
489 be said to be unsatisfactory for more than 60 per cent of the villages
482 have a Lower Primary School. Transport facilities were not satisfactory and as much as 86 per cent of the villages still depend upon primitive mode of transport, namely head load. Correlated with outmoded form of transport, is the prevalence of unduly high cost of transport.

*162 10.2. The number of the families covered by the survey was 1006
161 in the Border area, and 647 in the Project area and 184 in the General area. The average size of a village in the respective area is 100·6, 80·9 and 18·4 families. In the Border and Project areas females out number males being respectively 1076 and 1092 females per 1,000 males as against 940 females per 1,000 males in the general area
212 Literacy is as high as 34 per cent in the border area and 31 per cen
[562] in the Project area but as low as 17 per cent in the general area In all the areas literacy among females is very low.

*162 The working population (earners and earning dependents) is as high
464 as 55 per cent in the Border area, 54 per cent in the Project area and 63 per cent in the general area. While there were no cases of unemployment in the Project and General areas, 53 persons were reported unemployed from border area.

241 10.3. 51 per cent of the families in Border area are wholly agricul-
* 162 tural, 35 per cent partly agricultural and 14 per cent independent o
463 agriculture. The corresponding figures for the Project area are 61, 31 and 8 per cent respectively while for the General area they are 70 per cent, 29 per cent, 1 per cent respectively.

Predominantly agricultural families constitute 67, 76 and 90 per cent of the families in Border, Project and General areas respectively.

*162 10.4. 31 per cent of the families in Border area, 29 per cent in Project
423 area and 10 per cent in General area were absolutely without any land while 25 per cent, 39 per cent and 24 per cent of the families in the respective areas possessed small holding ranging from 0·24 to 2·30 acres representing 11,24 and 26 per cent of the total holding area in the respective areas. 36 per cent of the families in Border and Project areas and 41 in General area possessed medium sized holding (3 to less than 10 acres)

Name of village	No. of persons according to 1951 Census	No. of persons according to survey	Variation	No. of families according to listing schedule

Total ..	924	902	−20	184	.. ...

N. B.—1951 census population figures are not shown against Border Area and Project Area villages. This is because of the fact that in some cases in the Census report, the different blocks of a village have been enumerated as different villages, *e.g.*, the village **Sohkha** has been enumerated in **1951** census as three villages, *i.e.*, **Sohkha Phlang, Sohkha mission**, etc., while in some other cases, only one population figure has been recorded against a number of villages of which possibly one is the main village, others being its satellites and as these villages were selected without any reference to the **Census** Handbook, there is every likelihood of our selected villages not coinciding with **Census** villages. So far as migration is concerned it is **very** rare in big villages, **particularly** when they have some settled occupation but it was found through investigation that in some of the border villages due to continued adversities in their agricultural and other occupation people had to move away in search of work. **Migration** of some traders was reported from **Bholaganj** and **Lyngkhat**. Some Khasi families **were** reported to have migrated to Pakistan where they had got **agricultural** land. Heaviest emigration of this type was however, reported from **Sohkha**, a village selected from **Saipung-Darrang, M. P. C. D. Block**, but located **near** the Indo-Pak Border, where about **one third** of its **total** population was **said** to have migrated to **Pakistan**. Some **families** from **Mawdon** are **said** to have migrated to a nearby village due to unhealthy condition of the village. A study of population variation in **General area** villages given above, will show that there is **a net decrease of 20 persons** in the sample villages from **total number of persons recorded** in **1951** Census. This is accounted for by migration of **people** which is considerable in smaller villages particularly those depending on **shifting** cultivation. A few families from **Mawlaiteng** are said to have migrated to **Mawlum** a village **only a** few **furlong** away from **Mawlaiteng**. Migration was also reported from **Lamyrsiang, Domrya, Asola**, and **Jowe** from **Byrhoh** and **Mawkynshian** a few families were said to have left the village a few days ahead of the **date of** investigation for their cultivation at some distant place.

/892/ The Nongkrem Puja in the Khasi Mountains (Assam) (1)

126 1. All the pictures attached to this article are prepared from photographs taken by P. Frumentius Stegmiller, S.D.S., missionary in Shillong. The photographs were in part very difficult to take as they had to be made without being observed and in some cases the day was already well advanced.

by P. Dr. C. Becker, S.D.S., Apostolic Prefect of Assam.

631 About five English miles to the east of Shillong, the chief town of the Khasi Mountains, lies the town of Nongkrem. It is the seat of the king (u S'iem) who governs the state Nongkrem of Khyrim, the largest of the 25 Khasi little states and which is partly independent (semi-independent) of the English government. Nongkrem is best 796 known for the great sacrifice, simply called Nongkrem Puja or also 782 ka Pom blang-u-S'iem Nongkrem (Slaying the goat of the S'iem of Nongkrem) which takes place there annually. This festivity offers, as little else does, an instructive insight into the religious and social views and customs of this interesting mountain people and should therefore be given a concise description, which may be divided into three parts:

I. The Preparations for the Sacrificial Feast.

II. The Sacrificial Feast.

III. The Celebration that Follows.

I. The Preparations for the Sacrificial Feast

793 Just as matriarchy prevails in the family among the Khasi so a 643 similar arrangement has been kept in the management of the Khasi state, Nongkrem. In the state the S'iem is not the actual head but a high priestess, called ka S'iem sūd. Sūd means the divinity which watches over the royal races. The temporal government is transferred by the S'iem sūd to the S'iem; he acts as her authorized agent although independent in his decisions, working with his advisers, whose advice he must obtain in matters of importance. The moneys of the kingdom

18: Godwin-Austen G-3 (ca. 1872) 1875 AR7
Khasi AR7

211 rude stone monuments. At the village of Nougshai, near
[101] Shillong, are to be seen some very striking monoliths; and
[131] although they do not come up quite to the length of those at
Nurtiang (noticed by Dr. Hooker in his "Himalayan Journals"),
[133] yet they are very worthy of being mentioned. They stand on the open spur just above the village, and have been worked out of the beds of the Shillong sandstone series, and some of the smaller blocks have been taken from the conglomerate beds, the lowest in the series, and which come in, in the bed of the ravine, to the north of the spur. There are a number of monuments on this site, large and small, arranged both in line and on two sides of a square; the two largest have their central monoliths—height, 24 ft. 3 in.; width, 5 ft. 6 in.; thickness, 8 in.; and height, 23 ft. 2 in.; width, 2 ft. 9 in.; thickness, 1 ft., respectively.

[126] Plate ii., which is taken from a photograph by Mr. William Robert, Assistant Surveyor in the Khasi Hills survey party, gives an excellent idea of the second largest structure, showing the very massive flat-stone, the "Mao Kynthai," in front. This structure consisted of thirteen upright stones, which could not all be brought into the field of the camera; but the six outside stones on the right are shown. Many of the slabs in the
175 adjacent monuments have been overthrown and broken quite
211 recently, perhaps by Sepoys and camp followers from the military station close by. At one time a mountain battery of Eurasian Artillery was quartered there, and I attribute the overthrow of so many of the stones in the neighbourhood to their handiwork, who would look on such amusement as a "great lark." The Sepoy (native of India) is not of a mischievous disposition; the European and half-European (uneducated) is markedly so. Thus the monument with the highest stone is imperfect, and it must, when perfect, have been a very handsome one. This is a sad pity, after the time and labour that must have been expended in its erection.

361 I did not observe any new slabs anywhere in the immediate
712 neighbourhood. Nougshai must formerly have been a large
[211] and powerful village; it stands on a naturally very strong position, and old lines of fortification are to be traced on many sides, especially on the approach from the direction of the Falls of the Umiam. These old lines of defence are on a curious system: a ditch and bank have been carried forward from the main defences from 200 to 300 yards down the ridge of the spurs, thus effectually preventing an enemy working round the hill sides below the villages.

174 This fortified site points to a state of things in these hills
712 when the relations between the large village communities or
628

18: Godwin-Austen G-3 (ca. 1872) 1875 AR7
Khasi AR7

clans were very much as we find them at the present day among the Nagas and Kukis, beyond and bordering our present extreme limits, viz. that of constant feud. They are now the quietest, most peaceful, and contented of all the hill people on the eastern frontier.

In my former paper I did not allude to the cairns in these hills, which I am inclined to think, are works of greater age than the stone structures. The custom is one that certainly has long since been given up, for I could not obtain any satisfactory account of them. They are only to be seen on the northern side of the Khasi plateau, and Dr. Hooker, in his account of his trips to the Kollong Rock, did not fail to notice them. About Mairaug and towards Nougstoin they are very numerous, and always stand on commanding situations. On the path leading down the grassy spur to the stone monuments previously described, near Nougshai, is a very fine large example of a cairn, about eight feet high. They are usually plain hemispherical mounds of earth; but this one is faced all round at the base with slabs of stone about four feet high; they are frequently not higher than six feet. A distant view is shown in Plate iii.

Nowhere is there any trace of the earth that forms them having been excavated close by; it must, therefore, have been carried in some short distance, to avoid unsightly hollows near the structure. I should much like to have dug into one of these cairns, but was afraid to hurt the feelings of the people by doing so. They are very probably cinerarics of an earlier form to those now made of stone, and this point it might be interesting to clear up.

Beyond the Khasi area no cairns are to be found, at least I had never come across any until visiting North Munipur last winter (1872—73), where, at the head of the Imphal river, on the direct road from Samaguting, are four fine cairns, all faced with large boulders. They are old, and the Nagas now living in the village near said they had been made by another clan of Nagas, who long ago had gone further north, and the site of whose village had been lately re-occupied by Kukis.

Mr. C. B. Clarke, in a paper read lately before your Institute, refers to the different forms of the cinerary in the Khasi Hills; but he has not quite exhausted the subject, or got further than I did, although with regard to the disposal of the ashes of the dead he gives some further interesting particulars.

As I think that drawings are of very great interest, and better exhibit the many different forms of bone depository or cinerary that have been adopted at different periods by tribes inhabiting localities very far apart, and often quite unconnected affinitively,

18: Godwin-Austen G-3 (ca. 1872) 1875 AR7
Khasi AR7

764 172 [26 I give a sketch of a form of cinerary meriting attention, and not hitherto noticed (Plate iii.). Several of this form may be seen on a low spur near the Bazar of Jeddo at Shillong. The cinerary is above ground, and stands on a slightly raised platform; it consists of four thick stones, about three feet high, set on edge, and capped with a heavy top-stone; and, so far, it resembles the usual form, a figure of which is given in my first paper.* The approach to all these depositories is from the eastward by several low steps, and the whole structure is enclosed on three sides by large flat slabs (in the rough) standing on end—the largest being placed round the cinerary itself, overtopping it by three to four feet, and the remainder, thence diminishing in size, stand on either side of the steps. There are about six such monuments along the ridge of the spur, and I have seen no others similar elsewhere. They have been broken into, and the front stone removed, very probably by camp followers from our regimental bazar, which is close by. There is thus a double probability of their ultimate destruction altogether, should the station be extended in that direction.

Discussion.

000 The President said that the paper of Lieut. de Crespigny, on the Milanows of Borneo, contained a great deal of extremely interesting information, especially in relation to their religious customs; the author, however, attempted to connect the Milanows with the inhabitants of Timor, through the similarity of their religious beliefs. He (the President) did not venture to express any opinion on this point, not having any grounds for forming one. He thought, however, that, as a general rule, evidence of identity of races, derived from the comparison of the religions of savages, must be received with caution, especially in the absence of any information as to physical resemblance. The attention that is devoted to religion arises from the interest that is taken in the subject, rather than from the value of the evidence it affords of connection with other peoples. There must always be a great liability to error in the accounts of the religious customs of savages. Inquiries into the resemblance of the arts of different people, about which there could be no mistake, were, he thought,

The following information regarding the general aspect of [127] the Khasi and Jaintia Hills district, with some additions, is 133 derived from Sir William Hunter's Statistical Account of Assam. The district consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is very steep until a table-land is met with at an elevation of about 4,000 feet at Cherrapunji. Higher up there is another plateau at Mawphlang. This is the [361] highest portion of the hills, some villages being found at as high an elevation as close on 6,000 feet above sea level. Fifteen miles to the east of Mawphlang, and in the same range, is situated the civil station of Shillong, at an average elevation of about 4,900 feet. The elevation of the Shillong Peak, the highest hill in the district, is 6,450 feet above sea level. On the northern side of the hills are two plateaux, one between 1,000 and 2,000 feet below the level of Shillong, and another at an elevation of about 2,000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where 137 the hills have been denuded of forest, the country is covered 185 with short grass, which becomes longer and more rank in the 374 lower elevations. This denudation of forest has been largely 327 due to the wood being used by the Khasis for fuel for iron smelting in days gone by. The Government, however, has taken steps to protect the remaining forests from further 137 spoliation. A remarkable feature is the presence of numerous sacred groves situated generally just below the brows of the [778] hills. In these woods are to be found principally oak and rhododendron trees. The fir-tree (Pinus Khasia) is first met with on the road from Gauhati to Shillong, at Umsning, at an elevation of about 2,500 feet. In the neighbourhood of Shillong the fir grows profusely, but the finest fir-trees are to be seen

* The figures for Khasi population in the Khasi and Jaintia Hills district will be found under "Habitat."

421 has been acquired by the man after marriage. Here the wife
428 and children would inherit the acquired property, the youngest daughter obtaining the largest share of such property on the death of the wife. If there were no daughter, the acquired property would be equally divided amongst the sons.

[127] The following examples of the Synteng law of inheritance
428 are taken from the exhaustive diaries recorded by the late Mr. Heath, who was for some years Sub-Divisional Officer of Jowai. In the Nongkli doloiship ancestral land passes from mother to her youngest daughter; again, if a youngest daughter who has so acquired dies, the next youngest in point of age succeeds. Should such direct female succession fail, the family tree has to be looked up for the nearest branch, in which the youngest female, or her youngest female descendant, succeeds. Thus, respecting ancestral land, the youngest daughter, or youngest female descendant of youngest female heir, is virtually heir to entailed property. If a woman dies leaving acquired property, her youngest daughter or youngest granddaughter of that youngest daughter succeeds to all. In default, next youngest daughter, and so on. In default of daughters, the youngest son inherits. A man can hardly, in any circumstances, possess ancestral land; his property must almost necessarily be self-acquired. If a man dies leaving acquired property, his heir will be his mother, if alive, excluding wife, sons, and daughters. If the wife undertakes, however, not to marry again, she will get half, which will descend to her youngest daughter by her deceased husband. The mother, who thus gets the whole or half of her son's property, leaves it to her youngest daughter, or youngest daughter of that daughter, and so on, as described above in the case of a woman leaving ancestral or acquired property. If there is no mother, the man's youngest sister stands next heir with the same right as her mother. If there is no mother or sister, then the sister's female descendants stand in the man's mother's place. If there are none of these, then the man's youngest daughter succeeds to all. Ancestral property
[425] cannot be alienated without the consent of all the heirs in the entail. A gift of self-acquired property to any amount can be made by a donor during his lifetime. Acquired property cannot, however, be left by will out of the course sanctioned by

PREFACE.

121 This book is an attempt to give a systematic account of the Khasi people, their manners and customs, their ethnological affinities, their laws and institutions, their religious beliefs, their folk-lore, their theories as to their origin, and their language.

114 This account would perhaps have assumed a more
128 elaborate and ambitious form were it not that the author has been able to give to it only the scanty leisure of a busy district officer. He has been somewhat hampered by the fact that his work forms part of a series of official publications issued at the expense of the Government of Eastern Bengal and Assam, and that it had to be completed within a prescribed period of time.

000 The author gladly takes this opportunity to record his grateful thanks to many kind friends who have helped him either with actual contributions to his material, or with not less valued suggestions and criticisms. The arrangement of the subjects discussed is due to Sir Bampfylde Fuller, lately Lieutenant-Governor of the Province, whose kindly interest in the Khasis will long be remembered by them with affectionate gratitude. The Introduction is from the accomplished pen of Sir Charles Lyall, to whom the author is also indebted for much other help and encou-

SECTION V.

FOLK-TALES, TRADITIONS AND SUPERSTITIONS.

FOLK-TALES.

773 THE Khasis possess a considerable amount of folk-lore. The
128 tales which will be found reproduced in the original Khasi have been obtained from a collection which was in the possession of the Rev. Dr. Roberts, of Cherrapunji, who very kindly placed it at my disposal. The translations are by U Nissor Singh, Sub-Inspector of Schools, and the author of a Khasi English Dictionary as well as certain other educational works in that language. Dr. Roberts's collections would fill a book; so I have selected only a few of what I consider typical tales. At the instance of Sir Charles Lyall, I have given the Khasi and English side by side. The stories will speak for themselves,
133 but I add a few explanatory notes. The water-fall of Ka Likai
773 is a magnificent cascade in the rainy season; it can best be viewed from the heights of Laitkynsew. The water-fall is situated close to the village of Nongriat, which is approached by a succession of stone steps from the village of Tyrna, just below the Cherrapunji Laitkynsew bridle-path. "Dingiei," which is mentioned in the second tale, is the high hill to be seen on the right-hand side of the Shillong-Cherrapunji road soon after leaving Shillong. The highest point of the range is over 6,000 ft. The third tale contains the well-known story of Ka Pah Syntiew, the fabled ancestress of the Khyrim and Mylliem Siem families. The cave where Ka Pah Syntiew is said to have made her abode is still to be seen in the neighbourhood of Nongkrem. The story of the origin of the Siems of Suhtnga, who afterwards became the Rajas of Jaintiapur, is a well-known tale in the Jaintia Hills. A description of the

P. 160

nearly seventy years of age, spoke English a little, and kindly agreed to help by acting as introducer as well as interpreter. The Chowkidar of the bungalow, a Christian Khasi who spoke Hindi tolerably well was however our principal interpreter. Before proceeding to the village, I had studied Roberts' Khasi Grammar and also learnt simple sentences in Khasi necessary for collecting genealogies, kinship terms and connected details, like the inheritance of the ancestral house and lands. This portion of the data was collected entirely through questions and answers in Khasi; the other details were obtained with the help of myntri U Subu Rai and his friends and the Chowkidar, U Hudrington. On important points however, some checking was made, by simple questions in Khasi, which involved definite answers in the affirmative or negative. My students who had accompanied me for training in field studies, repeated some of my observations, in my presence and with my help and guidance.

My best thanks are due to Mr. K. Cantlie, Deputy Commissioner, Khasi and Jaintia Hills, for furnishing me with the letter of introduction to U Subu Rai and for other facilities. His published notes on Khasi law, especially the chapters on inheritance also proved to be of great value in carrying out the enquiries (5). In the subsequent portions of this article, references to the works of Gurdon and Cantlie, will be indicated merely by (G) and (CN) respectively.

CHAPTER II

General features of the district

128 2.1 In this chapter a brief note on the geography, population and economy of the district is given in order to provide a perspective and make the report self contained.

133 2.2 **Relief.**—The whole of the district is composed of hill tracts. On the northern and western border these hills take the form of tumbled ranges which run for the most part north and south and have a general height of two to three thousand feet. None of the hills in the central and southern portions of the district has anything rocky or precipitous about them. Their sides are covered with short grasses and from one direction or another, they can generally be negotiated by a man on horseback. There is a high plateau in the centre of the district, the general level of which is not much below 6000 feet though it decreases in height towards east and west.

2.3 **Rivers.**—The high plateau that traverses the centre of the district is the watershed of the hills. The following are the principal rivers. On the west there is the Jadukata or Kynshi river, further east come the Um Maopa and the Bogani which fall into the Surma. The Umngot or Maheskhali, known as the Pyian Gang in the plains of Sylhet, forms for a considerable distance the boundary of the Khasi and Jaintia Hills. On the north the principal rivers are Kakhri, the Digaru and Umiam. Farther west comes the Umkhen, Um Myntang and the Mynriang. All these rivers possess the characteristics usually associated with hill streams. The beds are rocky and gravelly; the currents swift and after heavy rains even small streams come down in spate. The rivers of the district are not used for traffic to any appreciable extent.

135 2.4 **Minerals.**—The Geological products of economic value are lime and coal. From the earliest days of British rule, the lime quarries of Khasi Hills formed one of the principal attractions of Sylhet, drawing a large number of Europeans to that district. The lime quarries are situated all along the southern face of the hills. Coal is found both in the cretaceous and nummulitic formations. The largest deposits of nummulitic coal are found at Cherrapunjee, Laitryngew, Mawlong, Mustoh, Mawsynram, Mawdon, Thanjinath, Lakadong and Narpuh. Cretaceous coal is found in Maobchlarkar, Barsora, Wapung Laitkynsew and in the Langrin field.

137 2.5 **Forests.**—The district exhibits a varied flora reflecting the variations in the physical features, configuration of the ground, adaphic factors and climatic gradient. In the pine zone, covering areas between 2500'- 6200' elevation are found the pines, birch, schima, oak, beech, etc. The evergreen hardwood zone, which forms belt along the foothills contains useful hardwood species of which the most important species are sal, nahor, cham, chap, gomari, etc. The dry grassy belt covering the lower slopes roughly between 500'-2500' elevation form the ideal ground for graziers.

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

CHAPTER IV

Result of the survey

4.1 **Distribution of sample.**—It has already been mentioned in Chapter I that purposive selection of ten villages from border area, eight villages from the project area and a random selection of ten villages from the general area, were made for intensive investigation. 125 128

It is not our intention to devote this Chapter on the specific needs of individual villages. Some common salient features of the villages relating to the situation of the villages, diseases occurring there and marketing, communication, educational and medical facilities obtainable in those villages are briefly described below for the purpose of giving intelligence into the condition of the sample villages.

The following table shows the group-wise distribution of the sample villages, their location by thana and subdivision and the number of families inhabiting each village at the time of the survey.

TABLE B-I

Sample villages in United K. & J. Hills and their location 621

Group	Name of villages	Thana	Subdivision	No. of families
(1)	(2)	(3)	(4)	(5)
Border area—	1. Lumshnong ..	Jowai ..	Jowai ..	63
	2. Amki —	Dawki .	Do ..	18
	3. Syndai ..	Do ..	Do ..	133
	4. Darrang ..	Do ..	Do ..	104
	5. Lyngkhat ..	Do ..	Do ..	28
	6. Nongjri ..	Cherra ...	Shillong ...	229
	7. Bholaganj ...	Do ..	Do ..	84
	8. Shella .	Do ..	Do ..	236
	9 Mawdon .	Do ..	Do ..	52
	10. Bajet ..	Do ..	Do ..	65

311 423 182 The total number of fragments in 697 holding in Border of area is 2,540 giving an average of 3.64 fragments per holding, that in 462 holdings in project area is 1,080 which gives on the average 2.34 fragment per holding, while in General area 165 holdings comprise of 443 fragments, *i.e.*, 2.68 fragment per holding. A comparison of the above figures with the average fragment figures of 1.61, 4.50, 4.40 and 3.73 per holding in Mikir Hills, Darrang, Sibsagar and Lakhimpur districts respectively goes to show that incidence of fragmentation in this district is higher than that in Mikir Hills but less than that in other districts.

It will be seen from table D4.1 at the appendix that in the small holding group (less than 3 acres) average number of fragments per holding is 1.99 in Border, 1.60 in Project and 2.01 in General area. The average sizes in the corresponding holding group being 1.36 acres 1.47 acres and 1.55 acres, in Border area, Project area and General area, the average size of fragments in the respective area works out at ·68 acres, ·92 and ·76 acres. Similarly it will be seen that average sizes of fragments for medium holding group are, in Border area 1.61 acres (average size of medium holding 5.63 acres) in Project area 1.85 acres (averages size of holding 4.95 acres) and in General area 1.51 acres (average size of holding 5.02 acres), those for large holding group being 3.15 acres, 3.06 acres and 3.49 acres respectively against the average large holding sizes of 19.55 acres, 15.25 acres and 12.53 acres in the respective area.

FARMS

241 592 6.5 The operating unit in the rural agricultural system is in most cases the family farm. Functions, entrepreneur, capital and manual labour as regards to the agricultural operations in these farms are done through a joint effort of the family unit. Rarely permanent farm servants are maintained though employment of casual labourers are employed during the busy seasons.

[128] In this enquiry a farm has been defined as comprising of all agricultural land operated by a single family with or without employment of labour. The family may or may not have the right of permanent occupancy and inheritance over the farm land operated by it, and in this sense the farm is distinguised from holding which comprises of such land only over which the family concerned possesses right of occupancy and inheritance.

8·5—In the following paragraphs we have reproduced the yield rates of different crops, calculated on the basis of area harvested and total produces reported by the cultivators. For assesment of correct yield rates it is necessary to conduct a scientifically designed crops cutting survey which in view of its largeness in magnitude and other complexities associated with the type of experiments, could not be fitted in with the programme of the present survey. It is admitted that the yield estimates worked out by us are proved to be subjected to the usual limitations of this type of data. 128 433

Yield

1. **Paddy.**—It will be seen from table above that average yields of paddy per acre for Border area, General area and Project area are respectively 8.38 maunds, 12.92 maunds and 12.60 maunds and for the district as a whole it comes to 11.65 maunds though there are cases where maximum yield goes to above 18 maunds per acre. Thus it is seen that the average yield is much less than the average yield for the State of Assam (plain district) which is above 18 maunds per acre. Average yield in Border area is evidently much smaller. Apart from low fertility of land, another reason for this low average is that in a number of villages selected from Border area such as Syndai, Amki and Lumshnong, there was widespread havoc to standing crops was caused by wild elephants. 243 433 [136]

2. **Potato.**—The average for the three areas comes to 21·61 maunds per acre which is in contrast to the State average of above 40 maunds per acre. Our estimate has in fact been lowered due to inclusion of a few villages in the foot hills where potatoes don't grow well, otherwise in a number of high altitude villages, yield per acre well exceeded 40 maunds. The average for Border area is rather too low. Apart from unsuitability of Border land of high altitude potatoes another reason for this low average is that during the reference year the crop suffered from widespread incidence of pests and insects. 244 433 [136]

3. **Orange.**—yield of orange in Border area, Project area and General area was found to be 5. 27 luties or 5396 numbers against 16.76 luties or 17162 numbers and 2.80 luties or 2867 numbers respectively Thus the average yield in Border area, even considering the mixed nature of some gardens is much low. The reasons are obvious. 245 433

4. **Betelnut**—Average yield per acre from Border area, Project area and General area was found to be 2.93 luties (18752 numbers), 4.11 luties (26304 numbers) ann 3.03 luties (19392 numbers) respectively bringing the average for all the three areas to 2.95 luties per arce. 249 433

5. **Betel leaf.**—Average yield per acre works out at 17·15 kuris, 50.64 kuris and 24 kuris in Border area, Project area and General area respectively. Thus in Booder area the average is much lower. This is due to the fact that most of the gardens remained unplucked for want of market for leaf.

511 It is seen that the per family average annual expenditure is Rs.909·00 nP. in Border areas, Rs.1008 00 nP. in Project area and Rs.828·00 nP. in General area. The per family annual net income in the respective area being Rs.852·86 nP., Rs.988·84 nP, and Rs.949·51 nP. it follows that the budget of the average family is deficit in all the areas. [426] This deficit is usually made up either by restricting the consumption expenditure during the lean months of the agricultural year or by taking loans.

221 511 The field work of the survey was started during the month of February, i.e., hardly after two months, of harvesting of winter paddy and during the harvesting period of cash crops like orange, betelnut, potatoes, etc. During this period people get money through the sale proceeds and naturally they [114] were tempted to spend comparatively higher amount on food. In fact, it was made clear during investigation that as lean months are approaching when people did not have money to purchase food articles, they used to lead a very austere life. This period is particularly very hard for the Border people because unlike people of other two areas they do not have [128] even paddy in store. As the above figures of annual expenditure of a [125] family were calculated on the basis of information collected for one month preceeding the date of investigation, in respect of food and non-food articles, and for one year in respect of miscellaneous items, there is every likelihood of the average per family expenditure on food and non-food articles being over-estimated.

128 511 As in the case of income, consumption of articles produced at home or at farm as well as those received out of the goods, services and gift and loan were valued in money terms on the basis of the local average retail prices in respect of the commodities concerned. Thus even firewood and other wild vegetables and fishes obtained by fishing were valued in terms of money. Of the total average expenditure on food, the food articles obtained in kind and consumed at home account for about 18 per cent in Border area, 53 per cent in Project area and 57 per cent in General area. Thus the share of food articles obtained in kind and consumed at home to the annual expenditure of a family is very low in Border area. This is natural because they depend almost exclusively on cash crop cultivation.

511 Out of the total expenditure, food account for about 68 per cent in Border area, 67 per cent in Project area and 73 per cent in General area. In all the areas cereals alone took the bulk of the expenditure on food, i.e., 66 per cent, 75 per cent and 81 per cent in the respective areas

It is seen that expenditure on pulses, vegetables and milk are very low. In fact only a few of the Tribal villagers take pulses, milk and vegetables. Rice and fish or meat are the only items of the dishes of most of the villages.

Among non-food articles fuel and light accounted for 6 per cent in Border area, 5 per cent in Project area, and 5 per cent in General area. Khasis are heavy chewers of betelnut and this accounted for 5 per cent of total annual expenditure in border area, 4 per cent in Project area and about 3 per cent in General area while tobacco and tea in tea-stall accounted for about 5 per cent, 4 per cent and 4 per cent respectively of the total annual expenditure in the three areas. Expenditure on liquor

Bibliography

I. Introductory Remarks

601
114

Professor K. P. CHATTOPADHYAY (Calcutta University) published in 1941 an analysis of Khasi kinship terms [1] based on eight genealogies which he collected in the Mawphlang area, about sixteen miles south-west of Shillong [2]. He discussed in this paper a previous publication by Professor HODSON [3] where special features of certain Khasi kinship terms are held to prove the pre-existence of a dual system in a one-time Khasi social order and he quotes also the late RAI BAHADUR S. C. ROY's work on Khasi kinship [4] and lists of Assamese relationship terms, contained in "Census of India Reports" [5] and Khasi terms in U NISSOR SINGH's "Khasi-English Dictionary" [6], P. R. T. GURDON's monograph on the Khasi [7] and in SIR KEITH CANTLIE's "Notes on Khasi Law" [8]. Discussing these previously published papers, CHATTOPADHYAY arrives at the conclusion that HODSON's hypothesis of a dual organization in a hypothetical former Khasi society was not justified [9].

question and indeed has been compiled without knowledge of Professor CHATTOPADHYAY's work, and before he very kindly sent a private copy of this work, which had not been available to me previously.

The present paper offers data on the following subjects:

1. Khasi kinship terms from the Mawshai Khasi plateau-area in the Khyrim State, about 20 to 30 miles south-east of Shillong, which are in some minor details different from the Mawphlang data, collected by CHATTOPADHYAY, south-west of Shillong;
2. Comparative data from the Wár-Khasi;
3. from the plateau-area of Jowai in the Jaintia [10] Hills, and
4. from the Wár-Jaintia;
5. Aspects of the Khasi kinship terms, with special reference to the matrilineal order of society, and to the respective position of women and men there, especially the particular consideration which the biological relationship through the father receives in kinship terminology, in spite of the emphasis on the matrilineal structure in Khasi society (comp. term No. 1 of the list and its discussion in para 3/*b* of the present paper, on p. 408).

The data were collected in field researches to which I was enabled by two Research Grants for comparative studies in matrilineal civilizations of India, given by the Viking Fund Inc. (now: Wenner-Gren Foundation for Anthropological Research) in New York, during the periods 1949-50 and 1951-52. My gratefulness to the foundation for enabling me to carry out these field researches, as well as to the University of Madras, for granting me Sabbathical leaves for the same purpose, is here once more recorded.

My research programme was based on the first tentative working hypothesis, laid down in my book "Mother-right in India" [11], but includes also various other aspects of study which have not been pre-planned, or even considered there [12], as for instance also the present comparative study of kinship terms in areas of four Khasi dialects and their special significance to the Khasi matrilineal social system. The material was collected during a five weeks house-to-house study in the recently founded Plateau Khasi village Maw Syn Jri, during April and May 1950. This village consisted mostly of houses, owned by Khasi elder sisters and inhabited by them, with their families, after they had left the ancestral home in the main village Kharang, about one mile across the valley on the western side of the new settlement. The ancestral family houses there were in the possession of either the mother, or, if she was no more alive, the youngest daughter of the family, the *ka khun khaddu* [13].

[10] Jaintia, (Pnár or "Synteng") are the Khasi speaking eastern neighbours of the Khasi proper. As among the Khasi, so also among Jaintia the people in the cool plateau highlands are in many ways different from those who settled in the luscious tropical rainforests of the southern slopes, now situated just north of the East Pakistan frontier: — the so-called Wár-country, where economy is mainly based on pan-leaf gardening.

III. Explanations

1. General

124 Most of my informants were illiterate. The spelling of the terms was
•128 checked and corrected by my English-speaking and writing Khasi- and
601 Pnár- friends, mentioned in para one, to whom thanks are being here once more expressed. All responsibility for spelling mistakes, however, which may have slipped into this list has of course to be borne by me.

Blanks (—) or question marks (?) in one of the columns do not necessarily mean that there is no word used, by the respective group, for the particular term. They more often indicate that my informants did not use, or know, the particular term, or that I failed to enquire about it in a
[114] manner sufficiently clear to my informants. This is particularly true of general terms, partly or fully corresponding to English general terms, such as parents or grand-parents, or the terms No. 9/*a* and *b*, 13, 15/*a*, 19-21, and 26, which were partly explained to me, by Khasi friends in Shillong, where I stayed some time after completion of field-work during the rainy season. Hence I could no more return for verification to the little accessible Wár-villages in the steep southern slopes. Although I am planning to utilise a future opportunity for such checking up, I am yet publishing the present results in the hope that they may thus become accessible to field-workers among other S. E.-Asiatic, and especially Austro-Asiatic speaking peoples.

193 All terms which are equal for both sexes (cf. Nos. 10, 11, 18, 19, etc.)
601 are used with *ka* and *u* respectively. These sexdetermining preposed articles,
128 as also the honorific *i* are specially mentioned in the list, only if this is essential for the understanding of the respective terms as in Nos. 3-5, 7, 8, or 10.

2. Special

601 Term No. 1 — to give birth or beget (*kha*) signifies also relatives on the paternal side as in *para kha* (paternal cousins No. 9/*c*), in contradistinction to *para kur*, 9/*b*, (lit.: cousins of the clan), i. e. maternal cousins, since the clan is a matrilineal unit. This usage of the word *kha* appears also
[842] significantly in the terms 15/*a*, 17, 18/*b*, 20, 22, 32 and, as an integral part of the Khasi kinship terminology, renders it highly improbable that the Khasi matrilineal system could lave originated in ignorance of the biological function of the father. It is a significant feature in the matrilineal social system.

The terms 3 to 3/*b* refer to unmarried but biologically marriageable youths.
[881] It will be noted that there are (and were in 1914) no indications of puberty-
[584] rites for either girls or boys. There is also no child-marriage among Khasi. The use of special terms for mature, unmarried youths is therefore significant.

Term 6 — *i* as honorific article, is at the same time indicative of
[428] diminution [23], which is remarkable for two reasons: (firstly) the diminution is used for the oldest and most respected family members, like the diminution

[23] NISSOR SINGH (1906), p. 84.

Khasi AR7

21 rude stone monuments. At the village of Nougshai, near
[101] Shillong, are to be seen some very striking monoliths; and
[131] although they do not come up quite to the length of those at Nurtiang (noticed by Dr. Hooker in his "Himalayan Journals"), yet they are very worthy of being mentioned. They stand on
[133] the open spur just above the village, and have been worked out of the beds of the Shillong sandstone series, and some of the smaller blocks have been taken from the conglomerate beds, the lowest in the series, and which come in, in the bed of the ravine, to the north of the spur. There are a number of monuments on this site, large and small, arranged both in line and on two sides of a square; the two largest have their central monoliths—height, 24 ft. 3 in.; width, 5 ft. 6 in.; thickness, 8 in.; and height, 23 ft. 2 in.; width, 2 ft. 9 in.; thickness, 1 ft., respectively.

[126] Plate ii., which is taken from a photograph by Mr. William Robert, Assistant Surveyor in the Khasi Hills survey party, gives an excellent idea of the second largest structure, showing the very massive flat-stone, the "Mao Kynthai," in front. This structure consisted of thirteen upright stones, which could not all be brought into the field of the camera; but the six outside stones on the right are shown. Many of the slabs in the
175 adjacent monuments have been overthrown and broken quite
211 recently, perhaps by Sepoys and camp followers from the military station close by. At one time a mountain battery of Eurasian Artillery was quartered there, and I attribute the overthrow of so many of the stones in the neighbourhood to their handiwork, who would look on such amusement as a "great lark." The Sepoy (native of India) is not of a mischievous disposition; the European and half-European (uneducated) is markedly so. Thus the monument with the highest stone is imperfect, and it must, when perfect, have been a very handsome one. This is a sad pity, after the time and labour that must have been expended in its erection.

361 I did not observe any new slabs anywhere in the immediate
712 neighbourhood. Nougshai must formerly have been a large
[211] and powerful village; it stands on a naturally very strong position, and old lines of fortification are to be traced on many sides, especially on the approach from the direction of the Falls of the Umiam. These old lines of defence are on a curious system: a ditch and bank have been carried forward from the main defences from 200 to 300 yards down the ridge of the spurs, thus effectually preventing an enemy working round the hill sides below the villages.

174 This fortified site points to a state of things in these hills
712 when the relations between the large village communities or
628

Uptill now the main sources of forest revenue in the district are timber, limestone, lac, bay leaf and elephants. 13

2.6 **Agriculture.**—The greater proportion of population of the distict subsist on agriculture. The staple crops raised in the district are wet and dry rice, various kinds of millets, maize, potatoes, pineapples, oranges, arecanut, betel-leaf and bay leaf. To a smaller extent they grow in the gardens round their houses vegetables, pulses and occasionally sugarcane. 24

2.6.1 **The main crops : Rice.**—While wet rice is grown in the valleys with which the hills are intersected, dry rice is grown on the hill sides. Highland rice is seldom grown twice running on the same spot for after one crop the soil is exhausted and a fallow period of four to five years is usually allowed. Jowai subdivision is predominantly a wet rice producing area. In Shillong subdivision main wet rice pockets are the Bhoi area stretching upto the sung valley and the northern portion of the plateau, the Mylliem state, the south-western portion of the district and the southern plain portion of the district adjoining East Pakistan. Dry rice is grown more or less through out the district. While Jowai subdivision can claim self sufficiency in rice, Shillong subdivision is a deficit area and the people in this subdivision particularly those in the southern portion (border area) of the district have to depend on supplies from outside. Though there is no reliable statistices of the area under rice, a rough estimate is given elsewhere in the land utilisation table. 243

Maize and millet.—are two important food crops of the district grown more or less throughout the district.

Potatoes are extensively grown in the higher slopes and in the lower land which are well drained. Generally two crops of potatoes are raised annually in the district. In respect of production and export of potato this district occupies the topmost position in the State of Assam. 244

Orange, betel leaf and arecanut are most extensively grown in the southern base of the hills, *i.e.* all over the border areas. Oranges are also grown in Bornihat areas, in the northern portion of the district. Orange and betelnut plantations extend from the foot of the hills to a height of about 1500 feet and are carried up the ravines which score the southern face of the high plateau. The district is an important producer of Bay-leaf which is abundantly found in the border areas of the district. Other valuable cash crops of the district are black pepper, turmeric, chillies, ginger, pineapple and various other fruits. 245

·26.2 **Agricultural seasons.**—For wet rice, the lands which are naturally irrigated by virtue of their very location, are ploughed or hoed by about the middle of February and seed sown in May or June. Harvesting takes place in October and November. For dry rice, the land is hoed by about the middle of September, the solds are collected into little heaps and burnt and by February the land is again hoed up and the seed sown in April - May. Harvesting goes 243

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of

THE KHASIS

SECTION I.

HABITAT.

101 162 THE Khasis reside in the Khasi and Jaintia Hills district of Assam. They number 176,614 souls, which total is made up of:—

Khasis	107,515
Syntengs	47,883
Christian Khasis	17,125
Khasis inhabiting other districts	4,091
	176,614

131 162 563 The Khasi and Jaintia Hills district is situated between 25° 1′ and 26° 5′ North Latitude, and between 90° 47′ and 92° 52′ East Longitude. It contains an area of 6,157 square miles, with a total population at the Census of 1901 of 202,250 souls. In addition to the Khasis there are some members of Bodo tribes inhabiting parts of the district.

The Lyngam tribe appears to have been reckoned in 1901 as Khasi, there being no separate record at the last Census of these people.

101 131 [133] 563 The district is split up into two divisions, the Khasi Hills proper and the Jaintia Hills. The Khasi Hills form the western portion of the district and the Jaintia Hills the eastern. The Khasis inhabit the Khasi Hills proper, and the Syntengs, or Pnars, the Jaintia Hills. The latter hills take their name from the Rajas of Jaintia, the former rulers of this part of the country, who had as their capital Jaintiapur, a place situated at the foot of the Jaintia Hills on the southern side, which now falls within the boundaries of the Sylhet

[P.]

1-Gordon E-4.5 (no date) 1907 AR7 Khasi AR7

101 district. The Lynngams inhabit the western portion of the
131 Khasi Hills proper. A line drawn north and south through
563 the village of Nongstoin may be said to form their eastern boundary, and the Kamrup and Sylhet districts their northern and southern boundaries, respectively. The people known as *Bhois* in these hills, who are many of them really Mikirs, live in the low hills to the north and north-east of the district, the term "Bhoi" being a territorial name rather than tribal. The eastern boundary of the Lynngam country may be said to form their north-western boundary. The Wárs inhabit the precipitous slopes and deep valleys to the south of the district. Their country extends along the entire southern boundary of the district to the Jadukata, or Kenchi-iong, river where the Lynngam territory may be said to commence towards the south. There are some Hadem colonies in the extreme eastern portions of the Jaintia Hills. It is these colonies which are sometimes referred to by other writers as "Kuki Colonies." They are settlers from the North Cachar Sub-division of the Cachar district within recent years. It is possible that the title Hadem may have some connection with *Hidimba*, the ancient name for the North Cachar Hills.

APPEARANCE.

142 The colour of the Khasi skin may be described as being usually brown, varying from dark to a light yellowish brown, according to locality. The complexion of the people who inhabit the uplands is of a somewhat lighter shade, and many of the women, especially those who live at Nongkrem, Laitlyngkot, [361] Mawphlang, and other villages of the surrounding high plateaux, possess that pretty gipsy complexion that is seen in the South of Europe amongst the peasants. The people of Cherrapunji village are specially fair. The Syntengs of the Jaintia Hills are darker than the Khasi uplanders. The Wárs who live in the low valleys are frequently more swarthy than the Khasis. The Bhois have the flabby-looking yellow skin of the Mikirs, and the Lynngams are darker than the Khasis. The Lynngams are probably the darkest complexioned people in the

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Khasi Hills.	Jaintia Hills.
1. Lyngkah (Barpani or Khawang)	Kyllon. (Sohtaga).
2. Nongkrem	Pynsing.
3. Um-long (Maslong the hat at Laban)	Maslong. (Nartiang).
4. Rangbap (Iew-lah at Cherra) (Mawtawar in Mylliem) (Umsaw in Nongkhlaw)	Mawiang. (Jowai).
5. Shillong (Laitlyngkot)	Mawlai. (Shangpung).
6. Pomtih or Pomtiah (Mawkhar, small market)	Pynkat. (Mynsi).
7. Umsih	Thyne-blein.
8. Yeo-duh (Mawkhar, large market)	Ka-lut. (Jaintiapur).

In the War country, markets are usually held every fourth day, e.g. at Nongjri, Mawlang, Tyllap, and Shella. At Thoria the market is held every Friday, and at Hat-majai, or Bholagunj, every Tuesday.

THE LYNGAMS.

Although mention has been made incidentally in various parts of this monograph of Lyngam customs, it has been thought necessary to give the Lyngams a separate chapter, as these people differ so very greatly from the Khasis in their manner of life, and in their customs. *Lyngam* is the Khasi name; the Garo name for the Lyngams is *Mopem*. There are several *Mopem* villages in the north-eastern corner of the Garo Hills district, and there is regular communication kept up between these villages and the Lyngam inhabitants of the Khasi Hills district. The Lyngams must not be confused with the *Bimi* or *Nimdonigra* Garos who inhabit the low hills to the north of the Khasi Hills district, and are called by the Khasis *Dio*. All Lyngams claim to be Khasis, they dislike being called Garos; but although it is true they speak what may be called a dialect of Khasi, and observe some of the Khasi customs, the Lyngams are more Garo than Khasi.* Before proceeding further, it should be stated that the Assamese of Boko call the Lyngams *Nonipá* Garos, all hill people being Garos to the Assamese of that region, without distinction

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

or difference. It is owing to these three different names being 101
used for the same people that there has been so much confusion about Lyungams previously; e.g. at one census they were named *Lyungam*, at another they received the appellation of Garo, and at a third enumeration they were called Khasis. In Section I. 131
the habitat of the Lyungams has been roughly defined. It is 361
impossible to define the Lyungam country exactly, because 173
these people are continually shifting their village sites owing to the exigencies of *jhum* cultivation, which has been described in Section II. Some of the Lyungams preserve a tradition that they originally came from the Kamrup plains. It is interesting that a people, like the Garos in so many respects, should have the same idea as the Garos as to the hills on the south bank of the Brahmaputra not always having been their abode. The Garo legend is that they dwelt for 173
some years in the Goalpara and Kamrup plains after they 361
descended from Thibet, and before they moved to the Garo 144
Hills; and there is unmistakable evidence of their occupation of both districts in the shape of certain Garo villages on both banks of the Brahmaputra for some little distance up the river. If, as I suspect, the Lyungams are an offshoot of the Garos, it is, perhaps, possible that they entered the Khasi Hills much in the same way as the Garos entered the hill district to which they have given their name. The Lyungams are much darker 142
than the Khasis, and possess the Thibeto-Burman type of 177
feature often to a marked degree. It is not extraordinary that they should have adopted some of the Khasi customs, for the Khasis, being the stronger people, would in course of time be bound to influence them in this respect. That the Lyungams 411
observe the matriarchate and erect (some clans) memorial 211
stones is not peculiar, because the Garos, like the Khasis, are 764
also a matriarchal people (to a limited degree), and the custom of erecting memorial stones is not confined to the Khasis, for other hill tribes in Assam observe the practice, e.g. certain Naga tribes and the Mikirs; and the Garos themselves put up carved posts, called *hima*, in honour of the departed. Although 582
there is not much intermarriage between the Khasis and the 101
Lyungams nowadays, perhaps in days gone by there was a 144
mixture of blood, the result being the hybrid race we are now

10: Clarke U-3 (no date)1874 AR7 Khasi AR7

The STONE MONUMENTS *of the* KHASI HILLS. By C. B. CLARKE. [Communicated by Professor H. Fawcett, through Sir John Lubbock, Bart].*

131 THE Khasi Hills form a plateau, at a mean elevation of 4,500 feet above the sea, between the plain of Assam on the north and the plain of Sylhet on the south. They are inhabited by the 101 Khasi tribe, a people very distinct from the Hindoos north and south of them, and who are a branch of a race which extends eastward as far as South China. Immediately east of them are the Jaintea people, also called Sintengs, who are very closely allied in race and customs to the Khasi tribe. The 133 Jaintea country is physically a portion of the same plateau as the Khasi, and is only arbitrarily divided from it, and exhibits the same grassy hill-tops. The Khasi and Jaintea tribes together occupy the political district administered by the Deputy-Commissioner of Shillong, and the whole plateau is accordingly called the Shillong Plateau by Mr. Medlicott, the Dep.-Superintendent of the Geological Survey in India. Shillong is the English station which is the political capital. The plateau is remarkable for its freedom from the dense jungle which covers the neighbouring Himalayas at similar elevations; it is a fine rocky moor-like plateau, with isolated

* The woodcuts illustrating this paper have been kindly lent by Mr. Murray.

[p. 481]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

133 the highest point is the Shillong Peak, 6,445 feet, covered with scrub,
137 grassland and forests (mostly oak, rhododendron and pine trees). The Jaintia Hills are considerably lower, with much flat land; wet paddy cultivation is practised here and there where sufficient water is available. From the plateau of the Khasi Hills northwards to the Assam Brahmaputra Valley there is a gentle slope covered with thick jungle, and the southern slope towards the Bengal plain is very steep, so that

101
102
619

MAP. 8. — *Map of the Khasi-Jaintia Hills with Classification of Groups.*

133 the upland remained practically cut off from the plains until the
137 middle of the 19th century.

Following the geographical and ecological differences, the five
619 groups are segregated into fairly well-defined cultural areas, each developing a different economy and dialect:

[131]
[24]

1. The Jaintia[1] — associated mostly with wet rice cultivation.
2. The Khasi (upland Khasi) — practise potato cultivation with small-scale rice and maize cultivation.
3. The War — inhabit the southern slope of the Khasi and Jaintia Hills (they are called geographically the Khasi War and the Jaintia War). Due to the heavy rainfall, the soil is the most fertile in the Khasi and Jaintia Hills. The Khasi War practise jhuming of which the main yield is millet. In the lower part of this area, pan-leaf, betel-nut, and orange gardens are cultivated. The Jaintia War practise wet rice cultivation like most of the Jaintias, as well as pan-leaf cultivation.

1. They are called also the Synteng or the Pnar.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

I. Setting and Economic Background of Sohkynduh and Kongton

361 632 [131] Sohkynduh and Kongton are villages of the Kadashinong,[1] one of the areas under the Cherra Chief. The Kadashinong is situated on the southern slope of the Khasi Hills, in what is called War country. These two villages are situated at the farthest point from both Shella, the centre bordered by the plain, and Cherrapunjee, the seat of the Cherra Chief, one of the centres of the upland Khasi Hills. The people 184 at Cherrapunjee say that these villages are one of the most backward 121 parts of the Khasi Hills. They correspond to Rombagiri in the Garo [171] Hills, as they lie in the innermost parts and more traditional economic and social settings have been preserved there than in other villages. These are also the reasons why I selected those villages as my field.

361 It is nine miles to Sohkynduh from Cherrapunjee, crossing two [131] deep valleys towards the east. Kongton is located at the heart of the mountain ranges, ten miles from Cherrapunjee, towards the north- [487] east. It is about twelve miles from Sohkynduh to Kongton, and the way leads through one of the most difficult passes, where even [162] villagers seldom travel. In December, 1955, Sohkynduh was a community of 48 households (List 6), and Kongton of 62 households (List 9). The settlements of both villages are clustered in the southern depressions of a mountain, not far from the summit, a typical location [134] of Khasi villages. Sohkynduh has poor soil, covered with plenty of pieces of stones. The yield therefore is very poor. On the other hand, Kongton, a much older village, enjoys fertile soil, and is one of the most prosperous communities in the Kadashinong.

241 The major economy of both villages is shifting cultivation. We have already seen, in the chapters on the Garo, the fundamental technique of "Jhuming cultivation." The differences between the 423 Garo and the Khasi shifting cultivation are to be found in two aspects: one is the nature of the crops and the other is the type of landowner- [171] ship. In this area, the main crop is millet, while that of the Garo is [241] rice. Besides the shifting cultivation, the Khasi have pan-leaf gardens and sometimes pineapple gardens, though on a small scale and not in every household. The most important feature of Khasi shifting cultivation is the development of private ownership. In the tribal areas in Assam, such private ownership of the jhum field is quite an

1. Kadashinong is the name of a group of villages. Its literal meaning is "twelve villages," and it comprises the following villages: Sohkynduh, Rymmai, Mawbawein, Mawshiut, Mawmang, Kongton, Shyntiang, Krohiawhiar, Pdei, Tenshun, Nongpriang, and Diengsaw. (Khasi spelling follows the customary usage in Cherra State.)

APPENDIX

SOME ADDITIONAL INFORMATION FROM SHELLA AND JATINGA

SHELLA

Shella is situated on the lowest of the southern slopes of the Khasi Hills, bordering on the Sylhet plain of East Pakistan. For centuries the people of Shella maintained close trading connections with the people of the plain, so that they have been much influenced by the Hindu. They have been to some extent divorced economically and culturally from their own people who live in the uplands and on higher part of the slopes. Actually, this is a natural result of their geographical location. From Cherrapunjee, the southern edge of the upland Khasi Hills, only a narrow footpath goes down to Shella. The altitude of Cherrapunjee is about 5,000 feet and of Shella from 500 to 1,000 feet, and the distance between them is 8 miles. The path descends very steeply and is full of hard stones. This difficulty of communication is also why the Hindu influence did not penetrate the upland Khasi, as in the case of the Jaintia Hills.[1]

This area has a unique political organization which differs from the majority of Khasi states who are traditionally ruled by the members of the Siem clan. Shella is organized as a confederation, called 'Shella Confederacy,' and consists of four local villages. The head of the village is called *wadadhar*, and is elected by the villagers every three years. The number of households of the Shella Confederacy was about 900 in January 1956. The names of the four villages and their *wadadhar* in 1956 were:

Name of village	*Name of wadadhar*
1. Shella	Devish Mohan Roy
2. Mushtoh	Ditojou Roy
3. Nongtrai	Orju Roy
4. Tyngnger	Jabuni Roy

Each village is divided into sections. For instance, Shella village has nine sections: (1) Jasir, (2) Disong, (3) Duba, (4) Jamau, (5) Nongrum, (6) Nongnong,

1. However, Shella was the only way out and the main gateway from the Khasi Hills to the plain; it was here that the British first entered the Khasi Hills. They proceeded from Shella to Cherrapunjee and made the latter headquarters of the Khasi Hills in 1833.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Shella

Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards 131
along the steep slope, looking down towards the Bengal plain. The climate
of this part of the hills is considered to be one of the worst in tropical India 132
for human habitation. The Bengal plain, though warmer than this area, is
considered more healthy. This border land is the zone of malaria, typhoid, 164
black fever, cholera, etc. None of the Bengalee peasants dare to live in such
an area. However, it is the most fertile for products such as betel-nuts, pan- 433
leaves, oranges, bananas and pineapples, and it also produces limestone. These
people seem to prefer to settle in this zone and to enjoy its prosperity, at the 164
expense of human lives: every year, especially between March and September,
the inhabitants suffer from various fevers and dysentry and other diseaes, many
of the weaker facing death. 648

Before the Partition of India and Pakistan, the products of Shella were 177
carried down the Shella River to Sylhet, one of the biggest centres in East 178
Bengal, which brought unimaginable wealth to the Shella people. Their houses
were built by carpenters from Sylhet. The style and structure of these houses 434
were exceptionally elaborate for the Khasi. They purchased vast rice fields [439]
in the plain, which used to be cultivated by Bengalee and Garo labourers [342]
engaged by them. These Khasi do not themselves know how to cultivate [166]
rice fields; they have always been managers or landowners. Their boys used [464]
to be sent to high schools and colleges in Sylhet. As a result of their trading [871]
with the Bengalee, many of them read and speak fluent Bengalee. There is [191]
no difference between their style of clothing and that of the Bengalee, though [291]
the women maintain their traditional dress in the Shella style.

They have thus been distinguished from the rest of the Khasi not only
geographically, but also economically and culturally. Their personality also
differs sharply from the rest of the Khasi. They are very sociable, and quick, 157
a quality lacking among the Khasi of Sohkynduh and Kongton. They are
clever enough to deal with strangers. The upland Khasi say Shella people 184
are very cunning. This remark shows one side of these people. They had to 648
be cunning, since they traded with the Sylhet Bengalee who were said to be the
most cunning of their race. Their role in the trade and in the history of the 177
modernization of the Hills was considerable. For centuries they represented 178
intellectual Khasi owing to their contact with Hindu civilization, while the
Hills remained in darkness. They assumed an important role when the British [439]
established an administration in the Hills, and even up to now, many leading
Khasi originated from this area: for instance, Lati Hat, the first interpreter
of the British Headquarters at Cherrapunjee; Jeebon Roy, who was the first
Magistrate among the Khasi; Maham Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jeebon Roy); Nichols Roy, Minister of Health
and Prisons of the Assam Government, Member of the Legislative Assembly,
and Missionary of the Church of God; R. R. Thomas (brother of Nichols Roy),
Principal of the Gauhati University, etc.

Through constant cultural contact with Hindu, and encouraged by their 177
economic prosperity, the Shella Khasi, like the Jaintias, have been much
influenced by Hindu culture. However, this does not mean that the people 648
of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, 771
and some ceremonial elements were borrowed from the Hindu, most of the 795

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

[Shella]

wife who lives with him. The Khasi woman lives with her mother. Some say the Khasi woman is his second wife, other say their marriage is not recognized by the public. 563

Actually, owing to the bad climate, very few non-Khasi live in this area. Besides the two non-Khasi just mentioned, there were a Bengalee tax collector and an Assamese Forest Officer, both of whom lived at Shella Bazaar. Bengalee villages are situated about five miles south of Shella. Except in the bazaar, Bengalee and Khasi have no social contact with each other, and intermarriages have been rare.

However, it is obvious that in the past the Khasi must have had many cases of intermarriage with Bengalee. Among the Khasi there is a clan called 'Dkhar.' The term 'Dkhar' is also used for the peoples of the plains: Bengalee are called 'Dkhar' by the Khasi. They say that the Dkhar clan originated in Bengalee girls who married Khasi men and who went to live in the Hills. It is said that in older days, the Khasi often raided the Sylhet plain and kidnapped Bengalee girls as well as goods. In Bengalee records of Sylhet, Khasi appear as 'bloody Khasi.' Khasi old men say that in order to increase their population they did sometimes kidnap Bengalee girls, but that they treated these girls very nicely and kindly, no differently from their own people. Since they follow the matrilineal system, they decided to name their descendants 'Dkhar.' It is said that all the present Dkhar people are descendants of such marriages. The Dkhar are found more on the southern slopes of the Khasi Hills i.e. among the Wars. 101 563

It seems there were many reasons for the descendants by marriage between the Khasi and the Bengalee to become Khasi. First of all, it is said that in the olden days the Khasi wanted to increase the population by such marriages. At the same time, a Bengalee who married a Khasi became an outcast from his or her own society owing to the caste system, and this inevitably made them Khasi. Secondly, the Khasi were primarily grouped into the *iing*, and they considered the marriage relation as of secondary importance. Hence it was rather difficult to remove by marriage a Khasi man or woman from their native place. Thirdly, Khasi could hardly live in the plain where no betel-nut or pan-leaf gardens were available; they could not engage in rice cultivation in the plain, as the technique is entirely different from the cultivation of betel-nut or pan-leaf. Moreover, they said they could not stand the heat in the plain. Therefore, the orientation of intermarriages was always towards the Khasi community: the Khasi brought outsiders to their own land; they did not themselves leave.

Such a marked tendency on the part of the Khasi to remain attached to their own homeland, is in no way contradictory with the phenomena of their migration to places outside the Khasi Hills, owing to the exploitation of their homeland and to the increase in population. The formation of Jatinga represents such an instance; there are also the cases of modern Khasi women from sophisticated urban areas, who easily leave their homeland, after marriage with a non-Khasi; this also appears in the following data on Jatinga. 161 167 [563]

JATINGA

Jatinga is a Khasi village situated in the North Cachar Hills, three miles west from Haflong, the headquarters of the North Cachar Hills. The number of households was about sixty in February 1956. Their economy depends on the pan-leaf, orange and pineapple gardens, similar to that of the Shella people. 131 621 433

[p. 208]

SOCIAL GROUPINGS AMONG THE KHASIS OF ASSAM

by BHABANANDA MUKHERJEE

Dept. of Anthropology, Govt. of India

Calcutta

(Received on 20th October, 1957)

Introduction

THE Khasis, who inhabit the United Khasi and Jaintia Hills district of Assam, are matrilineal. Like the Garos, they, are matrilocal in residence. Exclusive ownership over family property is claimed by the Khasi women and the youngest daughter (*Ka-Khadduh*) who lives permanently in the house of her mother, is the custodian of the family property and the holder of religion (*Ka bat ka-niam*)[1].

This paper deals with the social groupings, namely, the clan, sub-clan and family, of the Khasis. The materials were collected in 1954 from Mawphlang, Cherapunji and Mamluh and Mawsmai villages farther south of the Chera State.

Discussion

In the language of the Khasi, the prefix *Ka* is usually used before the name of a woman or any object belonging to a woman (or considered feminine). The use of *Ka* as a prefix before the name of each social group is suggested to have bearing on Khasi matriliny. *Kur* is not a very expressive and exact term for a clan. *Kakur*, which is supposed to have sprung from the woman (*long jaid na ka kynthei*)[2] is more exact. Similarly, *Ka-K'poh* and *Ka-iing* denote the sub-clan and family respectively.

IV. THE PLACE OF THE KHASI IN THE WORLD.

By

David Roy

131 The Khasi country lies in the hills of the province of Assam in North East India. Khasi clans are exogamous and matrilneal, and the Khasis speak a MonKhmer language.

121 In speaking of the place of the Khasi in the world I intend to explain the Khasi's own view of his relation to other peoples of the world.*

829 The Khasi is very conscious of his importance. He says a Khasi claims to be the centre of the world. The Khasi has acquired such a feeling of self-importance from his great confidence in himself; and this confidence he has derived from the position in which his relationship-terminology represents him as standing with respect to himself and the world around him. Or, rather, his relationshisp terms and language are an expression of his attitude and notions.

601 The Khasi says—*Ka Kamie* (mother)

U Khun (son) — *Ka Kmie* (mother)

Which is = His mother

Himself (male) — His sister (female)

He calls this the family. Then he says—

Ka Kamie Kha (Father's mother)

U Kpa Kha (Father, Father's brother) (male) — *Ka Nia Kha* Father Father's sister (female)

* The writer of th is article is himself a Khasi (Christian).

[2] This account of Khasi culture, contributed by Anna P. McCormack, is based on field work during 1956-58 in the United Khasi-Jaintia Hills District. The author wishes to emphasize that her data are on the upland Khasis who inhabit the center of the District. She gratefully acknowledges support of the field work from the Department of Anthropology of the University of Chicago, the Wenner-Gren Foundation for Anthropological Research, Inc., and the Ford Foundation, for one of its Foreign Area Training Fellowships.

group of matrilineal and Mon-Khmer-speaking people who claim as their ancestral homeland the present-day United Khasi–Jaintia Hills District (within approximately 90° 47′ and 92° 52′ E. and 25° 5′ and 26° 5′ N.). This group includes the Jaintias (also Pnar or Synteng) in the southeast, who differ from the Khasis primarily in their duolocal residence pattern and less virulent forms of sorcery. (The Hadem in eastern Jaintia are a Kuki people.) It also includes the Lyngngams (also spelled Lynngam) in the west, who practice migratory swidden agriculture and certain peculiar funerary rites, and are said by Ehrenfels (1955) to be culturally intermediate between Khasis and Garos. Finally, it includes Bhois, Wars, and upland Khasis, which terms are primarily territorial. Bhoi country is the north-central part of the District, and is culturally complicated by the presence of Mikirs, Lalungs, and Nepalis. War country spans the entire southern length of the District, so that Wars divide into Jaintia Wars and Khasi Wars; of these, the Khasi Wars have traditionally transmitted property to sons as well as to daughters. The upland center of the District is the country of the Khasis proper, those whose culture provides the most useful model for interpreting the variations found elsewhere. [For general reference on all categories of Khasi culture, cf. Costa 1936 and 1937; also Gurdon 1907, especially for data on regional variations.] **Geography.** The District is 5,554 square miles of hilly tableland, intricately dissected by numerous rivers, and marked by significant ecological variation over very short distances. The tablelands step gently downward north from Shillong Peak, which at 6,445 feet is the highest point in the District, and over about 55 miles ease into the Brahmaputra valley where this is some 250 feet above sea level. To the south, the land slopes more steeply downward for about 20 miles, and then drops abruptly, in cliff and steep-slope formations, to the Ganges sea-level delta that begins at its north with Sylhet. The annual southwest monsoons drop torrential rains around Cherrapunji and Mawsynram villages (for Cherrapunji, a record 805 inches in 1861), but then, reaching Shillong 33 miles to the northeast, provide only about 100 inches per year. Rainfall is again greater in Bhoi, which shares the Brahmaputra valley climate. Climate is temperate on the high Shillong plateau, where it seldom freezes and never snows. To the north, climate becomes subtropical, forest is jungly, and fauna abound. The climate to the south is also subtropical. [Cf. Hooker 1891: chap. XXIX.] **Linguistic affiliation.** Khasi is one of the major Mon-Khmer languages, related to Mon, Khmer, Semang-Sakai, Nicobarese, and Palaung-Wa. The major Khasi dialects are Khasi, Jaintia, and Lyngngam, to which Grierson adds War. Further minor variations occur from village to village. The Khasis had no script until 1842, when the roman alphabet was successfully applied to the Cherrapunji dialect of Khasi proper. [Cf. Rabel 1961; Grierson 1903-28: 2; Bareh 1962.]

THE KHASI FESTIVAL OF 'POMBLANG'

S. BANERJEE

INTRODUCTION

The Khasi inhabit the upland of the central part of the United Khasi and Jaintia Hills district of Assam. They reckon descent through mother and the youngest daughter (Ka khadduh) of the house is the custodian of the ancestral property. Belief in the existence of spirits is strong among them and the causes of diseases are ascertained by taking recourse to the process of divination. They are ruled by different categories of Chief. The *Siem* is the highest official responsible for the administration of the state but a few small states are also governed by *Sirdars* with same powers as vested in the former although does not possess the same status. It is interesting to note that their priest whose rank is next to *Siem*, have also been allotted to perform this secular duties in some of the regions of the Khasi country. The Chief function through their respective council comprising elected members from different administrative units. He is rather subservient to this body as he is liable to be censured or even dismissed, if his activities are not in conformity with the Khasi traditional usage. Most of his directives are implemented through the assistance of his subordinates who are in-charge of various sections of the State. The Khasi place his grievance first to these junior officers for redress and justice, after which an appeal can be preferred to the *Siem* or any other higher officer as the case may be. One of the eminent States of the Khasi people known as Khyriem, where this festival is celebrated, consists of eight units for administrative convenience under the supervision of different grades of officials who participated in this celebration along with the *Siem* as representatives of the people.

The Khasi festival of *Pomblang* (Goat killing) described below used to be celebrated at one time in Shillong when the Khasi states of Khyriem and Mylliem were not separated. The first chief of the Khyriem state U Singh Manik shifted his headquarters to Nongkrem village after partition of the kingdom, which occured before the arrival of the British. He again moved to Langkerdem after a brief stay at the village of Lyneshing. He performed this festival as long as he was there, transferring it again to Nongkrem where he re-settled again. It was celebrated here for a long time and consequently it was named after this village. Although the ruling family had later on shifted its residence about sixty years ago to the present village Smit, during the time of U Klur Singh, Siem, it is performed regularly as *Nongkrem dance* which was observed by the author from 21st June to 25th June, 1955.

OBJECT OF THE FESTIVAL

It is being held every year since the days of U Shillong who was supposed to be the founder of original Khyriem State. They celebrate it to perpetuate his memory and pay homage with a view to ensure rain, good harvest, eliminating diseases and famine. He was worshipped along with other ancestors with view to guide the present Chief in his discharge of his duties and for the welfare of the people.

The house of Siem (iing-sad) where the rites are observed, is considered sacred. It consists of a big-hall (shlur) in the centre, surrounded by rooms. One of these on the north is used as a kitchen room (iing-chetja) where ritual

CHAPTER III

The Border Area

121 131 **3. 1 Definition of Border Area.**—The term 'border areas' although very frequently used does not refer to any well demarcated area. It was, therefore, decided after a joint discussion between the Director of Statistics with the Deputy Commissioner of the district and Subdivisional Officer, Jowai, that area within 20 miles of the Indo-Pak border line would be considered as the 'border area' for the purpose of the present survey. The list of the villages falling in this area was supplied by the Deputy Commissioner and the Subdivisional Officer.

3. 2 Condition of the Border Area before partition.—The border area under review thus comprised of the southern slopes of the Khasi and Jaintia Hills and a narrow strip of plains adjoining the southern slopes running along the Pakistan border. The area extends laterally over a length of about 120 miles, roughly from Maheskhola on the west to Sonapur on the east thus covering an area of 2,400 sq. miles approximately, comprising of 454 villages inhabited by population of 74 thousands. [161]

245 311 Barring the barren and rocky top plateaus the slopes are utilised or the production of valuable cash crops on intensive scale. These slopes provide suitable soil and climate for the production crops like arecanut, tezpatta, betel-leaf, oranges; pineapples and other fruits. On account of rich yields which such plantations give to the cultivators these slopes were, more densely inhabited and intensively cultivated than would appear possible from the topography of the area. Even the most inaccessible tracts in the slopes has been converted into rich orchards, wherefrom the produce was carried by headloads over steep gradients for several miles. Due to steep gradients little other use, except some jhuming here and there, could be made of this area. [482]

439 Because of the very topography, this land had its natural connections with Sylhet district now forming part of East Pakistan. From time immemorial the area had a flourishing trade with Sylhet district. It was a two-way traffic. The cash crops found eager buyers in the people of Sylhet, from whom in turn the people in the border area obtained supplies of rice, fish, vegetables and other necessities of daily life. Thus in prepartition days they enjoyed a very prosperous and settled economy. The rich buildings in the border area villages which are now lottering away, bear eloquent testimony to the past prosperity of the border economy.

439 458 648 With the partition of the country in 1947, trade with the plains of Sylhet, now forming part of East Pakistan, was restricted. As a result the whole economy of this region was completely shattered and the countryside which once hummed with activity and abundance was over-shadowed with unemployment, poverty and despair. All the cash crops-the mainstay of the border people lost the market in East Pakistan. for want of communication facilities the produce could not be

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

STATISTICAL ACCOUNT

OF THE

KHASI AND JAINTIA HILLS.

THE DISTRICT OF THE KHASI AND JAINTIA HILLS, called by the inhabitants Ka Ri Khási and Ka Ri Synteng, is situated between 26° 9′ 30″ and 25° 8′ 28″ north latitude, and between 91° 9′ 0″ and 92° 51′ 30″ east longitude. It contains an approximate area of 6157 square miles, and a population, according to the Census of 1872, of 141,838 souls. The principal town and Civil Station, which is also the headquarters of the Chief Commissioner of Assam, is Shillong, situated in 25° 32′ 39″ north latitude and 91° 55′ 32″ east longitude. 131 [101] [161] [632] [648]

BOUNDARIES.—The Khási and Jáintiá Hills District is bounded on the north by the Districts of Kámrúp and Nowgong; on the east by Northern Cáchár, the Nágá Hills District, and the Kapilí river; on the south by Sylhet District; and on the west by the Gáro Hills.

JURISDICTION.—The Khási and Jáintiá Hills constitute a Political District, removed from the jurisdiction of the ordinary Criminal, Civil, and Revenue Courts, and of the offices established under the General Regulations and Acts. The administration of the country is vested in the Chief Commissioner of Assam, the Deputy-Commissioner of the Khási and Jáintiá Hills and his Assistants, and the native Chiefs, who are variously styled Siems, Wáhadádárs, Sardárs, Dollois, Pathors, and Lyngdohs. Siem, or more properly Seim, is derived from the Khási word for 'soul, life;' Wáhadádár, from the Hindu term *uhdádár*, meaning an 'officer;' Lyngdoh strictly means a 'sacrificial soothsayer,' from the Khási *ong*, 'to speak,' and *doh*, 'flesh.' The District is divided into three portions, —namely, British possessions in the Khási Hills; petty dependent 648 631

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of

Hills, the kindred Synteng in the Jaintia Hills. The Lynn Gam who are classified by Gurdon as half Khasi and half Garo live in the western part of the Khasi Hills, the people who inhabit the low hill country in the north of the district, which is usually called "Bhoi," are named the Bhoi. Many of them are really Mikir. My obser-
361 vations of the Khasi are limited to the surrounding of Shillong from where I visited the village of Nongkrem which is about 13 kilometers away (75).

75. Cf. C. Becker, Anthropos 4 (1909), pp. 892-902.

The place is located in a trough between low hills which are covered by large stone boulders. A small water course runs through the village. The huts are partly built along the slopes of the hills which surround the village. The houses
342 (Plate X, 4) all stand on small plots of land which are separated from each other by low stone walls; a narrow passage leads to them from the front side. Sometimes this passage is completely missing, in which event one has to climb over the wall. The houses stand on foundations of layers of irregular stone boulders. The walls are made of wooden boards--sometimes of bamboo--and are covered on the outside by grass. Grass is also used for roofing. Each strand is tied individually to bamboo poles, as in Burma (not as in Bengal where it is squeezed together between bamboo poles). Especially typical is the form of the roof; it is high and steep in the middle and the roof ridge is curved. The roof slopes down

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

most of the neighbouring chiefs to resist the British, /77 and a long and harassing war, which was not brought /648 to a close till 1833. Cherrapunji then became the head- /175 quarters of the Sylhet Light Infantry, whose commandant was placed in political charge of the district, including the former dominions in the hills of the Raja of Jaintia, which he voluntarily relinquished in 1835 on the confiscation of his territory in the plains.

Cherrapunji, celebrated as the place which has the [132] greatest measured rainfall on the globe, became a popular station, and the discovery of coal there, and at several other places in the hills, attracted to it many visitors, some of whom published accounts of the country and people. The first detailed description /114 was apparently that of the Rev. W. Lish, a Baptist missionary, which appeared in a missionary journal in 1838. In 1840 Capt. Fisher, an officer of the Survey Department, published in the Journal of the Asiatic Society of Bengal * an account which showed that the leading characteristics of the Khasi race had already been apprehended; he mentions the prevalence of matriarchy or mother-kinship, notes the absence of polyandry, except in so far as its place was taken by facile divorce, describes the religion as a worship of gods of valleys and hills, draws attention to the system of augury used to ascertain the will of the gods, and gives an account of the remarkable megalithic monuments which everywhere stud the higher plateaus. He also recognizes the fact that the Khasis as a race are totally distinct from the neighbouring hill tribes. In 1841 Mr. W. Robinson, Inspector of Schools in Assam, included an account of the Khasis in a volume on that province which was printed at Calcutta. In 1844 Lieut.

* Vol. ix., pp. 833 sqq.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

limestone caves and underground water-courses on the southern face of the hills. This series contains coal-beds, e.g. the Cherra-field and that at Lakadong in the Jaintia Hills. Some description of the remarkable Kyllang Rock may not be out of place. Sir Joseph Hooker describes it as a dome of red granite, 5,400 feet above sea level, accessible from the north and east, but almost perpendicular to the southward where the slope is 80° for 600 feet. The elevation is said by Hooker to be 400 feet above the mean level of the surrounding ridges and 700 feet above the bottom of the valleys. The south or steepest side is encumbered with enormous detached blocks, while the north is clothed with forests containing red tree-rhododendrons and oaks. Hooker says that on its skirts grows a "white bushy rhododendron" which he found nowhere else. There is, however, a specimen of it now in the Shillong Lake garden. Numerous orchids are to be found in the Kyllang wood, notably a beautiful white one, called by the Khasis *u'tiw kyllang synrai*, which blooms in the autumn. The view from the top of the rock is very extensive, especially towards the north, where a magnificent panorama of the Himalayas is obtained in the autumn. The most remarkable phenomenon of any kind in the country is undoubtedly the enormous quantity of rain which falls at Cherrapunji.* Practically the whole of the rainfall occurs in the rains, i.e. from May to October. The remainder of the district is less rainy. The climate of the central plateau of the Shillong range is very salubrious, but the low hills in parts of the district are malarious. The effect of the different climates can at once be seen by examining the physique of the inhabitants. The Khasis who live in the high central plateaux are exceptionally healthy and strong, but those who live in the unhealthy "Bhoi country" to the north, and in the Lyngngam portion to the west of the district, are often stunted and sickly. Not so, however, the Wars who live on the southern slopes, for although their country is very hot at certain times of the year, it does not appear to be abnormally unhealthy except in certain

* The average rainfall at the Cherrapunji Police Station during the last twenty years, from figures obtained from the office of the Director of Land Records and Agriculture, has been 448 inches. The greatest rainfall registered in any one year during the period was in 1899, when it amounted to 641 inches.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

147 villages, such as Shella, Borpunji, Umniuh, and in Narpuh in
132 the Jaintia Hills.
361

ORIGIN.

173 The origin of the Khasis is a very vexed question. Although it is probable that the Khasis have inhabited their present abode for at any rate a considerable period, there seems to be a fairly general belief amongst them that they originally came from elsewhere. The Rev. H. Roberts, in the introduction to his Khasi Grammar, states that "tradition, such as it is, connects them politically with the Burmese, to whose king they were up to a comparatively recent date rendering homage, by sending him an annual tribute in the shape of an axe, as an emblem merely of submission." Another tradition points out the north as the direction from which they migrated, and Sylhet as the terminus of their wanderings, from which they were ultimately driven back into their present hill fastnesses by a great flood, after a more or less peaceful occupation of that district. It was on the occasion of this great flood, the legend runs, that the Khasi lost the art of writing, the Khasi losing his book whilst he was swimming at the time of this flood, whereas the Bengali
[212] managed to preserve his. Owing to the Khasis having possessed no written character before the advent of the Welsh missionaries, there are no histories as is the case with the Ahoms of the Assam Valley, and therefore no record of their journeys.
114 Mr. Shadwell, the oldest living authority we have on the
173 Khasis, and one who has been in close touch with the people for more than half a century, mentions a tradition amongst them that they originally came into Assam from Burma *viâ* the Patkoi range, having followed the route of one of the Burmese invasions. Mr. Shadwell has heard them mention the name Patkoi as a hill they met with on their journey. All this sort of
144 thing is, however, inexpressibly vague. In the chapter dealing
173 with "Affinities" have been given some reasons for supposing that the Khasis and other tribes of the Mon-Anam family, originally occupied a large portion of the Indian continent. Where the actual cradle of the Mon-Anam race was, is as

work is done. In order to ascend to a Bhoi house, you have to climb up a notched pole. The Bhois sacrifice a he-goat and a fowl to *Rik-ioplong* (Khasi, *Rymiew ling*), the household god, when they build a new house.

VILLAGES.

Unlike the Nagas and Kukis, the Khasis do not build their villages on the extreme summits of hills, but a little below the tops, generally in small depressions, in order to obtain some protection from the strong winds and storms which prevail in these hills at certain times of the year. According to the late U Jeelon Roy, it is *sang*, or taboo, to the Khasis to build a house on the last eminence of a range of hills, this custom having perhaps arisen owing to the necessity of locating villages with reference to their defence against an enemy. Khasis build their houses fairly close together, but not as close as houses in the Bhoi and Lyngam villages. Khasis seldom change the sites of their villages, to which they are very much attached, where, as a rule, the family tombs are standing and the *mainbynna* or memorial stones. In many villages stone cromlechs and memorial stones are to be seen which from their appearance show that the villages have been there for many generations. During the Jaintia rebellion the village of Jowai was almost entirely destroyed, but as soon as the rebellion was over the people returned to the old site and rebuilt their village. Similarly, after the earthquake, the ancient village sites were not abandoned in many cases, but the people rebuilt their houses in their former positions, although in Shillong and Cherrapunji they rebuilt the walls of the houses of wooden materials instead of stone. There is no such thing as a specially reserved area in the village for the Siem and the nobility, all the people, rich or poor, living together in one village, their houses being scattered about indiscriminately. To the democratic Khasi the idea of the Siem living apart from his people would be repugnant. In the vicinity of the Khasi village, often just below the brow of the hill to the leeward side, are to be seen dark woods of oak

SECTION VI.

MISCELLANEOUS.

TEKNONYMY.

551 The Khasis, like the Alfoors of Poso in Celebes, seem to be somewhat reluctant to utter the names of their own immediate relations, and of other people's also. Parents are very frequently called the mother of so and so (the child's name being mentioned), or the father of so and so, *cf. Ka kmi ka Hari, U kyn u Philip.* The actual names of the parents, after falling into desuetude, are often entirely forgotten. The origin of the practice may be that the Khasis, like the Alfoors, were reluctant to mention their parents by name for fear of attracting the notice of evil spirits. The practice of *teknonymy*, however, is not confined to the Khasis or the Alfoors of Celebes (see footnote to page 412 of the "Golden Bough"). The custom is also believed to have been prevalent to some extent not long ago in some parts of Ireland.

797 177 551 The advent of the Welsh Missionaries and the partial dissemination of English education has in some cases produced rather peculiar names. I quote some instances:—

U Water Kingdom, Ka Mediterranean Sea, Ka Red Sea; U Stickewell Bones, U Overland, Ka Brindisi, Ka Medina, Ka Mary Jones, U Mission, and Ka India.

KHASI METHOD OF CALCULATING TIME.

505 The Khasis adopt the lunar month, *u lynai*, twelve of which go to the year *ka sora*. They have no system of reckoning cycles, as is the custom with some of the Shan tribes. The following are the names of the months:—

505 *U Iylla-Iynplet*, corresponding to January. This month in the Khasi Hills is the coldest in the year. The Khasis turn

l: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

(*kylla*) the fire-brand (*iyngkot*) in order to keep themselves warm in this month, hence its name *kylla-lyngkot*. 805 132

U Rymphang, the windy month, corresponding with February.

U Lyber, March. In this month the hills are again clothed with verdure, and the grass sprouts up (*lyber*), hence the name of the month, *u Lyber*.

U Iaiong, April. This name may possibly be a corruption of *u bynai-iong*, i.e. the black moon, the changeable weather month.

U Jymmang, May. This is the month when the plant called by the Khasis *ut'ieu jymmang*, or snake-plant, blooms, hence the name.

U Jyllieu. The deep water month, the word *jyllieu* meaning deep. This corresponds to June.

U ndiitung. The evil-smelling month, when the vegetation rots owing to excessive moisture. This corresponds with July.

U'ndilar. The month when the weather is supposed to become clear, *synlar*, and when the plant called *ja'nailar* blooms. This is August.

U'ndi-lur. September. The month for weeding the ground.

U Ri-saw. The month when the Autumn tints first appear, literally, when the country, *ri*, becomes red, *saw*. This is October.

U'ndi sieng. The month when cultivators fry the produce of their fields in *sieng* or earthen pots, corresponding with November.

U Noh-prih. The month when the *prih* or baskets for carrying the crops are put away (*buh noh*). Another interpretation given by Bivar is "the month of the fall of the leaf." December.

The Khasi week has the peculiarity that it almost universally consists of eight days. The reason of the eight-day week is because the markets are usually held every eighth day. The names of the days of the week are not those of planets, but of places where the principal markets are held, or used to be held, in the Khasi and Jaintia Hills. The following are the names of the days of the week and of the principal markets in the district :— 805 443

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Shella

Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards along the steep slope, looking down towards the Bengal plain. The climate of this part of the hills is considered to be one of the worst in tropical India for human habitation. The Bengal plain, though warmer than this area, is considered more healthy. This border land is the zone of malaria, typhoid, black fever, cholera, etc. None of the Bengalee peasants dare to live in such an area. However, it is the most fertile for products such as betel-nuts, pan-leaves, oranges, bananas and pineapples, and it also produces limestone. These people seem to prefer to settle in this zone and to enjoy its prosperity, at the expense of human lives: every year, especially between March and September, the inhabitants suffer from various fevers and dysentry and other diseaes, many of the weaker facing death. 131 132 164 433 164 648

Before the Partition of India and Pakistan, the products of Shella were carried down the Shella River to Sylhet, one of the biggest centres in East Bengal, which brought unimaginable wealth to the Shella people. Their houses were built by carpenters from Sylhet. The style and structure of these houses were exceptionally elaborate for the Khasi. They purchased vast rice fields in the plain, which used to be cultivated by Bengalee and Garo labourers engaged by them. These Khasi do not themselves know how to cultivate rice fields; they have always been managers or landowners. Their boys used to be sent to high schools and colleges in Sylhet. As a result of their trading with the Bengalee, many of them read and speak fluent Bengalee. There is no difference between their style of clothing and that of the Bengalee, though the women maintain their traditional dress in the Shella style. 177 178 434 [439] [342] [166] [464] [871] [191] [291]

They have thus been distinguished from the rest of the Khasi not only geographically, but also economically and culturally. Their personality also differs sharply from the rest of the Khasi. They are very sociable, and quick, a quality lacking among the Khasi of Sohkynduh and Kongton. They are clever enough to deal with strangers. The upland Khasi say Shella people are very cunning. This remark shows one side of these people. They had to be cunning, since they traded with the Sylhet Bengalee who were said to be the most cunning of their race. Their role in the trade and in the history of the modernization of the Hills was considerable. For centuries they represented intellectual Khasi owing to their contact with Hindu civilization, while the Hills remained in darkness. They assumed an important role when the British established an administration in the Hills, and even up to now, many leading Khasi originated from this area: for instance, Lati Hat, the first interpreter of the British Headquarters at Cherrapunjee; Jeebon Roy, who was the first Magistrate among the Khasi; Maham Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jeebon Roy); Nichols Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nichols Roy), Principal of the Gauhati University, etc. 157 184 648 177 178 [439]

Through constant cultural contact with Hindu, and encouraged by their economic prosperity, the Shella Khasi, like the Jaintias, have been much influenced by Hindu culture. However, this does not mean that the people of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, and some ceremonial elements were borrowed from the Hindu, most of the 177 648 771 795

group of matrilineal and Mon-Khmer-speaking people who claim as their ancestral homeland the present-day United Khasi–Jaintia Hills District (within approximately 90° 47′ and 92° 52′ E. and 25° 5′ and 26° 5′ N.). This group includes the Jaintias (also Pnar or Synteng) in the southeast, who differ from the Khasis primarily in their duolocal residence pattern and less virulent forms of sorcery. (The Hadem in eastern Jaintia are a Kuki people.) It also includes the Lyngngams (also spelled Lynngam) in the west, who practice migratory swidden agriculture and certain peculiar funerary rites, and are said by Ehrenfels (1953) to be culturally intermediate between Khasis and Garos. Finally, it includes Bhois, Wars, and upland Khasis, which terms are primarily territorial. Bhoi country is the north-central part of the District, and is culturally complicated by the presence of Mikirs, Lalungs, and Nepalis. War country spans the entire southern length of the District, so that Wars divide into Jaintia Wars and Khasi Wars: of these, the Khasi Wars have traditionally transmitted property to sons as well as to daughters. The upland center of the District is the country of the Khasis proper, those whose culture provides the most useful model for interpreting the variations found elsewhere. [For general reference on all categories of Khasi culture, cf. Costa 1936 and 1937; also Gurdon 1907, especially for data on regional variations.] **Geography.** The District is 5,554 square miles of hilly tableland, intricately dissected by numerous rivers, and marked by significant ecological variation over very short distances. The tablelands step gently downward north from Shillong Peak, which at 6,445 feet is the highest point in the District, and over about 55 miles ease into the Brahmaputra valley where this is some 250 feet above sea level. To the south, the land slopes more steeply downward for about 20 miles, and then drops abruptly, in cliff and steep-slope formations, to the Ganges sea-level delta that begins at its north with Sylhet. The annual southwest monsoons drop torrential rains around Cherrapunji and Mawsynram villages (for Cherrapunji, a record 805 inches in 1861), but then, reaching Shillong 33 miles to the northeast, provide only about 100 inches per year. Rainfall is again greater in Bhoi, which shares the Brahmaputra valley climate. Climate is temperate on the high Shillong plateau, where it seldom freezes and never snows. To the north, climate becomes subtropical, forest is jungly, and fauna abound. The climate to the south is also subtropical. [Cf. Hooker 1891: chap. XXIX.] **Linguistic affiliation.** Khasi is one of the major Mon-Khmer languages, related to Mon, Khmer, Semang-Sakai, Nicobarese, and Palaung-Wa. The major Khasi dialects are Khasi, Jaintia, and Lyngngam, to which Grierson adds War. Further minor variations occur from village to village. The Khasis had no script until 1842, when the roman alphabet was successfully applied to the Cherrapunji dialect of Khasi proper. [Cf. Rabel 1961; Grierson 1903-28: 2; Bareh 1962.]

4.2 Natural calamities.—The villages are free from severe natural calamities like flood, erosion, earthquake and the like. Excessive rain has rendered the higher lands barren near Cherapunjee, Mawsynram, etc. During the monsoon after heavy rains, the small rivulets and streams come in spate dislocating communication from village to village which cause much inconvenience to the people in carrying on trade, marketing and other day to day activities.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

disfigured from the practice. Adults will chew as many as four or five betel-nuts a day, with the usual accompaniment of *pán* leaves. The estimated cost of maintaining an average family of the labouring class is about Rs. 8 or 16s. a month. 276 [434]

TOWNS: SHILLONG.—There are no towns in the usual acceptance of the word; but the chief places in the Hills, looked upon by the inhabitants as cities, are Shillong, Jowái, Cherrá Púnjí, and Shellá. According to the Census of 1872, Shillong had only 1363 inhabitants, Cherrá Púnjí 443, and Jowái 4502. Jowái, however, is a collection of rural hamlets, and the population of Shillong has entirely altered since the date of the Census. The latter place first became the Civil Station in 1864, in substitution for Cherrá Púnjí; and when Assam was erected into an independent Province in 1874, it was selected as the permanent seat of the Local Government. The Chief-Commissioner resides there, and also the heads of all departments in the Administration. The area of the Station is 7 miles in length by 1½ to 1¾ miles in breadth. A considerable native population is already settled, and is increasing from day to day. One of the largest weekly markets is held in the *bázár*; and with a view to facilitate access to the Station, which is the sanitarium for the Province of Assam, a cart road has recently been completed to Gauháti on the Brahmaputra, which will tend to make the place more and more important. An excellent water supply is introduced into Shillong through an aqueduct which has its source in the neighbouring hill streams, and sanitary measures are carefully enforced. Large sums of money have annually been expended on the erection of the public buildings necessary for the offices of the administration. A printing-press has been established, from which issue all the official documents and reports of the Province. The climate is excellent, the temperature being more equable than that of any other hill station in India, and therefore admirably suited to the constitution of Europeans. There is a church at Shillong, and a chaplain on the Bengal establishment officiates both there and at Gauháti. The cantonments were occupied in 1875 by the 43d Regiment of Assam Light Infantry, with three outposts. The strength was 9 European officers, 16 native commissioned officers, 80 non-commissioned officers, 772 fighting men, and 58 paid camp followers and non-combatants; grand total, 935. The total cost, including contingencies, was Rs. 189,190, or £18,919.

632

[443] [743] [491] [365] [364] [344] [213] [132] [346] [712]

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

253; revenue, *nil;* products, millet, oranges, betel-nuts, jack-fruit, pine-apples, chillies, and bay leaves; minerals, lime and coal. 631 651

These statistics give the following totals for the nineteen Khási States or Democracies:—Population, 78,992; revenue, Rs. 49,856. 8, or £4985, 13s., of which Rs. 22,732. 8, or £2273, 5s., is derived from lime quarries. The aggregate area of these States is elsewhere returned at 3997 square miles. 433

SUBDIVISIONAL ADMINISTRATION.—The twenty-five fiscal divisions which constitute the Jáintiá Hills are regarded as forming a separate Subdivision, under the charge of an Assistant-Commissioner, whose headquarters are at the village of Jowái. This Subdivision dates from 1869, for which year the separate cost of administration is returned at £1091. The following statistics, referring only to the Jáintiá Hills, are taken from the Report of the Assistant-Commissioner for 1876-77; for the rest, all information is included in the preceding sections of this Statistical Account, which apply generally to the whole District of the Khási and Jáintiá Hills. In the year 1876-77 the total revenue of the Jowái Subdivision amounted to Rs. 12,713, or £1271, 6s., of which Rs. 10,654 was derived from the house tax. The total value of the exports from the Subdivision was estimated at Rs. 197,575, or £19,757, 10s., including 16,000 *maunds* of raw cotton, valued at Rs. 120,000, and 5490 *maunds* of lac, valued at Rs. 54,900. The total value of the imports was estimated at Rs. 345,600, or £34,560, chiefly cotton and woollen cloth from Bengal, valued at Rs. 81,000; silk cloth from Assam, Rs. 25,000; 15,000 *maunds* of rice, value Rs. 60,000; 6229 loads of dried fish, value Rs. 35,344; 5287 *maunds* of salt, value Rs. 37,009; 609 *maunds* of tobacco, value Rs. 44,872. These figures are compiled from reports submitted by the police stationed at Jarán, on the Jáintiápur road, and from information collected from the chief traders of Jowái. They show an apparent balance of trade against the Subdivision amounting to Rs. 148,025, or £14,802, 10s. The population of Jowái and the surrounding villages is 4502 souls. 63 648 651

MEDICAL ASPECTS—METEOROLOGY.—The climate of the Khási and Jáintiá Hills is mild and equable. At Shillong the thermometer within doors ranges from about 58° in December to 70° or 75° in the hottest months. Out of doors the dry bulb varies between about 38° in the cold weather and 80° in May and June. A temperature higher than 80° is seldom recorded. During the three years ending 132

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

132 in 1876, the highest maximum temperature was registered in the month of August, the lowest minimum in January. From November until the end of March the weather is dry and bracing. Hoar-frost lies upon the ground almost every morning in the months of December, January, and February. Shallow water occasionally freezes over, but snow never falls.

The rainfall at Cherrá Púnjí is enormous, varying between 300 and 500 inches per annum. The heaviest fall is in the months of June and July. As much as 30 inches has been collected in one day in July, and 157 inches has been registered as the total rainfall of that month. The average rainfall of the three years ending in 1876 is returned at 368·41 inches. It is affirmed that a total of 805 inches fell in 1861, of which 366 inches is assigned to the single month of July. This excessive rainfall can be readily accounted for by the abrupt manner in which the hills at Cherrá Púnjí rise from the plains on the south. The vapour-bearing breezes of the south-west monsoon, sweeping across the heated, flooded plains of Lower Bengal, suddenly strike against the hills. The vapour as it ascends gets condensed into fogs and mists, and finally, when it reaches the crest of the range, discharges itself in torrents of rain, unequalled by that recorded in any other part of the world.

At Shillong, which is only 30 miles north and a little higher than Cherrá Púnjí, the average rainfall is only about 85 inches; but between these two Stations three higher ranges intervene, which deprive the clouds in passage of a considerable portion of their moisture. During the three years ending in 1876, the average rainfall at Shillong was 83·65 inches.

The rainfall at Jowái, a subdivisional Station in the Jáintiá Hills, 26 miles distant from the plains, holds a mid place between that of Cherrá Púnjí and Shillong, and is estimated at 150 inches in the year. During the three years ending in 1876, the average rainfall at Jowái was 145·62 inches; but in the last of these years alone as much as 309·21 inches was registered, of which 134·34 inches fell in the month of June.

133 The District is liable to shocks of earthquake. In September 1875 considerable damage was done to the houses in Shillong by a shock which extended with great severity as far as Gauhátí; and several minor shocks were experienced in the year 1876-77.

164 132 Diseases, etc.—Generally speaking, the climate of Shillong is pleasant and congenial to Europeans. English children thrive

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

remarkably, and there are few indigenous diseases of any kind. Malarious fevers of local origin are unknown, and cholera never prevails in the Hills except when directly imported from the plains. Notwithstanding the excessive rainfall, the climate of Cherrá Púnjí also is pleasant and salubrious. The rainfall is confined in great part to the five months from May to the end of September. For the rest of the year the weather is mild and very equable, and in the winter months almost pleasanter than that of Shillong. 164 132

Small-pox is the chief scourge amongst the Khásiás. The faces of more than half the people are seamed by the marks of this disease. Strenuous efforts have recently been made to introduce vaccination, and with some success. Within the past three years nearly 5000 children have been vaccinated. The number of vaccinations in 1876 was 1309, as compared with 1628 in the preceding year. 164 [751] [648]

Dysentery and bowel complaints generally prevail to a considerable extent; and, as at most other hill stations in India, the English residents at Shillong occasionally suffer from these diseases. Disorders of the liver are also not uncommon, usually affecting persons who have recently arrived from the plains, probably from unhealthy localities. When they have once passed through a short period of acclimatizing indisposition, most English residents at Shillong enjoy excellent health.

The *tarái* country lying along the foot of the Hills, especially on the northern side, is extremely malarious; and people passing through, especially pedestrians who travel without comforts and expose themselves to great fatigue, contract remittent fevers and agues of a severe type.

EPIDEMICS.—The following is a brief notice of some recent epidemics. Cholera made its appearance in the Hills in May 1869, travelling from the direction of Jáintiápur, on the borders of Sylhet. It only showed its presence by a few sporadic cases from time to time until the 11th July, when the disease broke out in an epidemic form among the police and in the jail. The police and the prisoners were at once moved into camp, and communication restricted as much as possible. These precautions probably had the effect of preventing the spread of the disease at Shillong. The epidemic lasted a week; it attacked twenty-four persons, of whom fifteen died. From Shillong the disease travelled southwards, the people deserting their villages as the plague broke out. In the 731

THE KHASIS

SECTION I.

HABITAT.

101 162 THE Khasis reside in the Khasi and Jaintia Hills district of Assam. They number 176,614 souls, which total is made up of:—

Khasis	107,515
Syntengs	47,883
Christian Khasis	17,125
Khasis inhabiting other districts	4,091
	176,614

131 162 563 The Khasi and Jaintia Hills district is situated between 25° 1′ and 26° 5′ North Latitude, and between 90° 47′ and 92° 52′ East Longitude. It contains an area of 6,157 square miles, with a total population at the Census of 1901 of 202,250 souls. In addition to the Khasis there are some members of Bodo tribes inhabiting parts of the district.

The Lyngam tribe appears to have been reckoned in 1901 as Khasi, there being no separate record at the last Census of these people.

101 131 [133] 563 The district is split up into two divisions, the Khasi Hills proper and the Jaintia Hills. The Khasi Hills form the western portion of the district and the Jaintia Hills the eastern. The Khasis inhabit the Khasi Hills proper, and the Syntengs, or Pnars, the Jaintia Hills. The latter hills take their name from the Rajas of Jaintia, the former rulers of this part of the country, who had as their capital Jaintiapur, a place situated at the foot of the Jaintia Hills on the southern side, which now falls within the boundaries of the Sylhet

Garo Hills	117	162
Manipur	69	101
Total	4,091*	

The following information regarding the general aspect of [127] the Khasi and Jaintia Hills district, with some additions, is 133 derived from Sir William Hunter's Statistical Account of Assam. The district consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is very steep until a table-land is met with at an elevation of about 4,000 feet at Cherrapunji. Higher up there is another plateau at Mawphlang. This is the [361] highest portion of the hills, some villages being found at as high an elevation as close on 6,000 feet above sea level. Fifteen miles to the east of Mawphlang, and in the same range, is situated the civil station of Shillong, at an average elevation of about 4,900 feet. The elevation of the Shillong Peak, the highest hill in the district, is 6,450 feet above sea level. On the northern side of the hills are two plateaux, one between 1,000 and 2,000 feet below the level of Shillong, and another at an elevation of about 2,000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where 137 the hills have been denuded of forest, the country is covered 185 with short grass, which becomes longer and more rank in the 374 lower elevations. This denudation of forest has been largely 327 due to the wood being used by the Khasis for fuel for iron smelting in days gone by. The Government, however, has taken steps to protect the remaining forests from further 137 spoliation. A remarkable feature is the presence of numerous sacred groves situated generally just below the brows of the [778] hills. In these woods are to be found principally oak and rhododendron trees. The fir-tree (Pinus Khasia) is first met with on the road from Gauhati to Shillong, at Umsning, at an elevation of about 2,500 feet. In the neighbourhood of Shillong the fir grows profusely, but the finest fir-trees are to be seen

* The figures for Khasi population in the Khasi and Jaintia Hills district will be found under "Habitat."

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

137 in the Jowai sub-division. In the vicinity of Nongpoh is observed the beautiful *nahor* or *nageswar*, the iron-wood tree. The latter is also to be found on the southern slopes of the hills in the Jowai sub-division. There are some *sal* forests to the west and south of Nongpoh, where the *sal* trees are almost as large as those to be found in the Garo Hills. Between Shillong and Jowai there are forests of oak, the country being beautifully wooded. Chestnuts and birches are also fairly common. The low hills on the northern and western sides of the district are clad with dense forests of bamboo, of which there are many varieties. The Pandanus or screw-pine is to 135 be met with on the southern slopes. Regarding the geological 133 formation of the hills, I extract a few general remarks from the Physical and Political Geography of Assam. The Shillong plateau consists of a great mass of gneiss, bare on the northern border, where it is broken into hills, for the most part low and very irregular in outline, with numerous outliers in the Lower Assam Valley, even close up to the Himalayas. In the central region the gneiss is covered by transition or sub-metamorphic rocks, consisting of a strong band of quartzites overlying a mass of earthy schists. In the very centre of the range, where the table-land attains its highest elevation, great masses of intrusive diorite and granite occur; and the latter is found in dykes piercing the gneiss and sub-metamorphic series throughout the southern half of the boundary of the plains. To the south, in contact with the gneiss and sub-metamorphics is a great volcanic outburst of trap, which is stratified, and is brought to the surface with the general rise of elevation along the face of the hills between Shella and Theriaghat south of Cherrapunji. This has been described as the "Sylhet trap." South of the main axis of this metamorphic and volcanic mass are to be found strata of two well defined series: (1) the cretaceous, and (2) nummulitic. The cretaceous contains several important coalfields. The nummulitic series, which overlies the cretaceous, attains a thickness of 900 feet in the Theria river, consisting of alternating strata of compact limestones and sandstones. It is at the exposure of these rocks on their downward dip from the edge of the plateau that are situated the extensive limestone quarries of the Khasi Hills. There are numerous

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

limestone caves and underground water-courses on the southern face of the hills. This series contains coal-beds, e.g. the Cherra-field and that at Lakadong in the Jaintia Hills. Some description of the remarkable Kyllang Rock may not be out of place. Sir Joseph Hooker describes it as a dome of red granite, 5,400 feet above sea level, accessible from the north and east, but almost perpendicular to the southward where the slope is 80° for 600 feet. The elevation is said by Hooker to be 400 feet above the mean level of the surrounding ridges and 700 feet above the bottom of the valleys. The south or steepest side is encumbered with enormous detached blocks, while the north is clothed with forests containing red tree-rhododendrons and oaks. Hooker says that on its skirts grows a "white bushy rhododendron" which he found nowhere else. There is, however, a specimen of it now in the Shillong Lake garden. Numerous orchids are to be found in the Kyllang wood, notably a beautiful *white one, called by the Khasis u'tiw kyllang synrai*, which blooms in the autumn. The view from the top of the rock is very extensive, especially towards the north, where a magnificent panorama of the Himalayas is obtained in the autumn. The most remarkable phenomenon of any kind in the country is undoubtedly the enormous quantity of rain which falls at Cherrapunji.* Practically the whole of the rainfall occurs in the rains, i.e. from May to October. The remainder of the district is less rainy. The climate of the central plateau of the Shillong range is very salubrious, but the low hills in parts of the district are malarious. The effect of the different climates can at once be seen by examining the physique of the inhabitants. The Khasis who live in the high central plateaux are exceptionally healthy and strong, but those who live in the unhealthy "Bhoi country" to the north, and in the Lynngam portion to the west of the district, are often stunted and sickly. Not so, however, the Wárs who live on the southern slopes, for although their country is very hot at certain times of the year, it does not appear to be abnormally unhealthy except in certain

* The average rainfall at the Cherrapunji Police Station during the last twenty years, from figures obtained from the office of the Director of Land Records and Agriculture, has been 448 inches. The greatest rainfall registered in any one year during the period was in 1890, when it amounted to 641 inches.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

WORSHIP OF NATURAL FORCES AND OF DEITIES.

133 In the Khasi Hills, especially on the southern side, there are numerous rivers, sometimes of considerable size, which find their way to the Sylhet plains through very deep valleys, the rivers flowing through narrow channels flanked by beetling cliffs which rise to considerable altitudes. The scenery in the neighbourhood of these beautiful rivers is of the most romantic description, and the traveller might imagine himself in Switzerland were it not for the absence of the snowy ranges. Of such a description is the scenery on the banks of the river Kenchi-
823 yong, the Jádukátá * or Punatit of the plains. It is in the bed
776 of the river, a few miles below Rilang, that there is the
782 curiously-arched cavity in the rock which resembles an upturned boat, which the Khasis call *Ka lieng blei* (the god's boat), and the plains people Bashanya's ship. Near to this, on the opposite side of the river, there is a rock bearing a Persian inscription, but so defaced by the action of the water as to be impossible to decipher. Like other inhabitants of mountainous countries, the Khasis reverence the spirits of fell and fall, and
226 propitiate them with offerings at stated times. A brief descrip-
782 tion of the ceremonies which are performed at Rilang, on the
776 occasion when the annual fishing in the river Punatit takes
787 place, may be of interest. The three Siems of Nongstoin, Langrin, and Nobosohpoh each sacrifice a goat to *Ka blei sam um* (the goddess of the river) before the boatmen can cast in their nets. In former times they say the passage up the river was obstructed by the goddess, who took the form of an immense crocodile: but she was propitiated by the gift of a goat, and the boatmen were then allowed to pass up the river in their boats. Hence it became necessary for the owners of the fishery to sacrifice annually a goat each to the goddess. At the time of my visit each Siem's party erected an altar in the bed of the river, in the midst of which a bough of the Khasi oak (*dieng saing*) was planted. The goats were then decapitated, it being considered an essential that the head

SECTION V.

FOLK-TALES, TRADITIONS AND SUPERSTITIONS.

FOLK-TALES.

773 THE Khasis possess a considerable amount of folk-lore. The
128 tales which will be found reproduced in the original Khasi have been obtained from a collection which was in the possession of the Rev. Dr. Roberts, of Cherrapunji, who very kindly placed it at my disposal. The translations are by U Nissor Singh, Sub-Inspector of Schools, and the author of a Khasi English Dictionary as well as certain other educational works in that language. Dr. Roberts's collections would fill a book; so I have selected only a few of what I consider typical tales. At the instance of Sir Charles Lyall, I have given the Khasi and English side by side. The stories will speak for themselves,
133 but I add a few explanatory notes. The water-fall of Ka Likai
773 is a magnificent cascade in the rainy season; it can best be viewed from the heights of Laitkynsew. The water-fall is situated close to the village of Nongriat, which is approached by a succession of stone steps from the village of Tyrna, just below the Cherrapunji Laitkynsew bridle-path. "Dingiei," which is mentioned in the second tale, is the high hill to be seen on the right-hand side of the Shillong-Cherrapunji road soon after leaving Shillong. The highest point of the range is over 6,000 ft. The third tale contains the well-known story of Ka Pah Syntiew, the fabled ancestress of the Khyrim and Mylliem Siem families. The cave where Ka Pah Syntiew is said to have made her abode is still to be seen in the neighbourhood of Nongkrem. The story of the origin of the Siems of Suhtnga, who afterwards became the Rajas of Jaintiapur, is a well-known tale in the Jaintia Hills. A description of the

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

wonderful mass of granite known by the name of the Kyllang Rock will be found in the section of the monograph which deals with geographical distribution. I have also added a photograph of the rock. The Syntengs have a story that when the strong west wind blows in the spring this is due to the advent of *U Kyllang*, who comes to visit his wife, the river *Umngot*, at that season: amongst the Khasis hills are all of them masculine, but to rivers is usually attributed the feminine gender. U Symper is another isolated rocky eminence rising from the Maharam plain close to the village of K'mawan. The best view of the hill is obtainable from Laitmawsiang on the path to Mawsynram. The village of Mawsmai every traveller from Therria to Cherrapunji knows. It is chiefly remarkable for a fairly large limestone cave, and its fine memorial stones. The Khasi theory to explain how the moon got its spots is, I believe, original, but is no more extraordinary than our own nursery tale about the "man in the moon." The *Sohpet Byneng* hill is the first hill of any size that the traveller sees on the Gauhati road when journeying to Shillong. It is close to Umsning Dak Bungalow. There are caves in the hill which are tenanted by bears. Strange to say, according to Khasi ideas, this is one of the highest points in the hills; in reality *Sophet Byneng* is some 2,000 ft. lower than the Shillong Peak. As mentioned elsewhere, the Khasis are very fond of dogs; so I have given their version of how the dog came to live with man. The well-known *thles* superstition will be found fully described under the heading of "Human sacrifices." I have, however, thought the tale of sufficient interest to reproduce at length here. The story of the river Rupatylli is a pretty tale, and is just such a one as would appeal to the imagination of mountaineers like the Khasis. The Kopili story is important, in that it indicates the origin of human sacrifices in the Jaintia Hills; it also throws, perhaps, some light on the question of the use to which the flat table memorial stones were put in years gone by. The superstition about the crossing of the Kopili can be vouched for by many who have taken the journey from the Jaintia Hills to North Cachar by the Kopili route. Mawpunkyrtiang is a small village close to Cherrapunji. The weird tale about the Siem of Malyniang is the pride of the Maskut people, for in olden days their King,

L. Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

i.e. the Siem of Malyniang, is supposed to have been a very powerful monarch amongst the Khasis. The story of Manick Raitong is interesting, in that it explains the origin of the use of the *sharati*, a bamboo flute of special make which is played only at funerals. The pool of water, which was formed after U Manick and the erring queen were burnt, may be connected with the *Umkoi*, or tank, which is dug to cleanse the souls of those who have died violent deaths. The idea of the bamboo, which bore leaves that grew upside-down, springing up from the buried flute, is also to be found in the Synteng tale regarding U Loh Ryndi's fishing-rod. Owing to considerations of space, I have had to curtail largely the folk-lore section. I have, however, kept the materials by me, and if at any future time there is reason to believe that the reproduction of more Khasi folk-lore is called for, I shall be glad to try to arrange that some of the other folk-tales be printed.

THE WATER-FALL OF KA LIKAI.

The water-fall of Ka Likai is one of the most beautiful water-falls in the Khasi Hills. Its stream flows from a certain river from the village of Rangjirteh and passes by the village of Nongriat. The fall can be seen distinctly from the village of Laitkynsew. What a beautiful fall it is when viewed in the autumn. It is also a very high fall. There was in olden days in the village of Rangjirteh a woman called Ka Likai. She was a poor woman who had a husband. When she had given birth to a child, the husband died. Whilst the child was yet a baby, she experienced much trouble in taking care of it on account of her poverty. After the child was able to walk, what a pleasure it was to her to see it growing, and able to play with other children. Then that woman married

another man; but he did not love the little child, and many a time he got angry because she could not take care of him more, on account of that child.

One day when she went to carry iron ore, her husband took the child and killed it. When he had cut up the body into pieces, he prepared curry with it, and placed the curry where the mother would come and eat it. When he had finished doing so, he threw the head and the bones of the child far away, but he forgot to throw away the fingers, which he had placed in a basket where the betel-nut was kept. When the mother returned from her journey, she inquired "Where is the child?" "She has just gone somewhere, I don't know where," he said. She remained silent awhile; then she said, "Is there any rice and curry?" He said "Yes, it is ready," and went out at the same time. When she ate, she found the curry very tasty, and she thought that he had got the flesh of a young pig from some one who had performed a sacrifice. When she had finished eating, she took up the betel-nut basket, but found the fingers of her child there. She shrieked and threw herself down, and then ran to the precipice and cast herself down it. All the villagers wondered, but no one ventured to prevent her as she held a *da* in her hand. From that time the waterfall was called the "Fall of Ka Likai."

country, resembling in height and size the Shillong "Peak" which lies opposite and to the north of it. There are many villages on this hill belonging to the Shillong Siem. In olden days on the top of this hill grew a gigantic tree overshadowing the whole world, the name of that tree was "ka Dingiei." The Khasis came to a determination that if this tree were cut down (lit. destroyed) the world would become good and would have light, for as long as it (the tree) remained standing, the world remained dark and unfruitful. They accordingly came to an unanimous decision to fell it. When they cut (the tree) during the day and went back next morning, they found that the marks of cutting had been obliterated. Thus they cut each day, and next morning they found that the marks had disappeared. This was the case always. Then they marvelled why this thing was thus. They asked questions and they investigated; ka phreid (a very small bird) said "all this has happened because a tiger comes every night to (the foot of) the tree and licks the part of the tree which has been cut." Thereupon the men, having plied their axes and knives the whole day in cutting the tree (instead of carrying them away as usual), tied them to the incisions, with their edges pointing outwards. So when the tiger went as usual at night to lick the incisions, the sharp blades of the axes and knives cut his tongue. Thenceforth the tiger ceased to go to the tree; and as the tiger ceased

Kyllang and Synger.

Kyllang is a hill which is near the village of Mawmai in Khadsawphra, and Synger is a hill which is situated in the Siemship of Maharam. The old folks say that these are gods which inhabit these hills, which are called U Kyllang and U Synger. These gods had a quarrel for some reason that we mortals do not know. They fought by throwing mud at one another. After they had fought, once or twice, U Kyllang proved victorious. So U Synger, having been humiliated, sits quietly in his own place to this day, and U Kyllang sits very proudly because he was victorious in the fight. The holes which are like tanks in U Synger's sides remain to this day; it is said that U Kyllang made those holes during the battle.

U Kyllang* and U Synger.

On the outskirts of Mawmai village, and to the west of it,

U Mawjong Sakhi ha Mawmai.

Hynñ 'mong Mawmai dei u wei u lim sha shughong 539 [22]

* Another version is that it was U Kynthai, another idol in Sumyapong territory, who fought with U Synger.

539 (535) stands a hill; it is a very beautiful hill. From a distance it looks like the hump of a bull. It has big trees growing on it, as people are afraid to cut them because they believe that the god "Ryngkew" is there, who takes care of and protects the country. This hill has two names, U Mawlong Siem and U Lyngkrem. U Mawlong Siem is the smaller (peak) on the southern side, and U Lyngkrem the taller one, in which there is a cave. The Mawsmai people sacrifice once or twice a year according to the god's demand. The Mawsmai people have, besides U Mawlong Siem, other village gods (called "Ryngkew"). The name of the one is "U Rangjabong," and the name of the other "U Ramsong." Sacrifices are offered to these two also. U Mawlong Siem is a very great and stern god. The other gods dare not engage in battle with him. He has a daughter called "Ka Khynat Khasi" (i.e. the sinuth of the Khasi). The god of the Umwai people fell in love with this daughter, but he was unable to obtain her in marriage, as U Mawlong Siem did not like him. It is not possible to know the exact reason why the name of U Mawlong Siem was given to him, but at any rate it appears that the name arose from the fact that in olden days before the death of a Siem there used to be heard at "Mawlong Siem" a great noise of beating of drums. The Mawsmai and the Mawmluh people used to hear it, and they attributed it to the god "Mawlong Siem," who beat the drum for his

The Kupli (Kopili).

539 133 484 782

The Kopili river rises in the "Black Mountains,"† and flows northwards into the Brahmaputra. It is the boundary between the country of the Syntengs and that of the Hadems.‡ Any traveller who wishes to cross this river must leave behind him the rice which he has taken for his journey, and any other food that he may have taken with him. If he does not do so, even if he crosses the river at an unforbidden point, he is liable to offer a sacrifice to the Kopili goddess. The people offer to her three fowls and three goats outside the village, i.e. one to the goddess herself, and the other two to her sons, U Shyngkram and U Jali; and five fowls, that

* Both rivers, Umngot and Umiew, or Umiam, have their sources in or close to the Shillong Peak. The word "*Rupatylli*" signifies in Khasi a solid silver necklace of a peculiar shape. In order to appreciate this pretty tale thoroughly, the reader ought to view the river "Rupatylli" from the heights of Laitkynsew, or Mahadeo, whence it is to be seen glistening in the sun like a veritable rupatylli or silver necklace.

† These mountains are the high hills which lie to the east of the Jowai Sub-Division, and which form part of the boundary line between the Khasi and Jaintia Hills District and North Cachar.

‡ The word Hadem is possibly a corruption of "Hidimba," the old name for North Cachar.

[101]

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

they may all three feast together; this is in the case of one transgression only. But in the case of a man who has committed more than one, it is not possible to say how many goats and fowls must be sacrificed, because the river often demands offerings on account of a man's parents or relatives having crossed the river at some time or other.

From the time of the old Siem to that of U Ram Singh Siem, they used to sacrifice to this great goddess two persons during the months of November and December at the time of offering a sacrifice at Jaintiapur. After a ceremony performed by the Brahmins at Jaintiapur, the victims are led to the Mawshai (Shangpung) market, where they are allowed to take and eat anything they like. After that they conduct them to Sumer; but some say that the stone on which the victims are beheaded is situated below the village of Ka Iew Ksi, near a stream which falls into the Kopili, and where there is a *mawkynthei* (flat table-stone) close to that sacred river.

They place the victims on that stone, where the executioner beheads them with a terrible sword. After that they throw the dead bodies and their heads into the river. But in the days of U Markuhain (U Raj Indro Singh) "who was our contemporary," they have ceased to do so out of fear of the East India Company. The victims are known by the name of "Mugha Khara."

782

782 One month before the celebration rice liquor is poured into a hollowed-
796 out gourd bottle in the house of the S'iem sīd and offered before the rishot Blei as a 'suit' (sacrifice of drink). This is done in order to in-
[769] form the u Suidnia long S'iem (the spirit of the first great-uncle on
[776] the maternal side who was the first king), the ka Blei long S'iem (the divinity who makes kings kings) and the u Blei Shillong (the god Shillong), that preparations are now being made for the Puja and that they might help with them.

776 The u-Blei Shillong plays the chief part in the whole ceremony. He enjoys great reverence among the Khasi, especially in the kingdom Nongkrem and Nylliem. Not far from Nongkrem a mountain
[133] peak rises 6,450 feet above the sea. It is the highest peak in the Khasi Mountains, its name is "Shillong Peak." Here is the seat of
[778] the god Shillong. The story goes that a man appeared here once, who said he /894/ had not been born but came of himself (shu long). He also told the people that they would receive the kings, S'iem. So the god who lives here was called u Shu long (he who is out of him-
[163] self), from which the Europeans gradually made the word Shillong and also gave this name to the splendid mountain station in the heart of the Khasi Mountains.

796 After the S'iem sīd has determined exactly the day of the cere-
782 monies, the news of this is sent out two weeks prior to the ceremony to the village elders (Rangbah shnong). This is done on the day of the large market (jū duh), which takes place every eighth day. Two weeks after is the pom blang, also on the day of the large market, which is discussed below.

The way in which the invitation is issued is interesting. A num-
[211] ber of chains about an ell long are made of bamboo rings. These are called kyrwoh. One of these is sent to the oldest man of each village. Since the Khasi formerly had no script, this bamboo chain always served as a sign of invitation or summons to the S'iem for ceremonies, or of danger of war, or of court matters and such. The degree of urgency was shown by the form of the links; in the case of great haste the form was longish and flat, otherwise correspondingly rounder. The sending of the kyrwoh to the village elders serves now as a sign of invitation for the whole village to appear at the ceremonies and at the same time as a demand to gather together the prescribed sacri-
[651] ficial gifts. Each of the six districts, into which the kingdom Nongkrem is divided, must furnish a goat; each individual but must pay a tax (called pynthok) of one rupee and four annas in addition. Very poor people only have to pay one anna or even only a half. The sacrificial gifts, such as rice, various sacrificial animals, fish, brandy

Family Property and Maternal Rights

/127/ by C. Becker S.D.S., Wurzburg

The fall of 1910 and the entire following year found the distin-
114 guished head of the Ethnographic Museum in Munich, to whom this anniversary volume is dedicated, on a research and collection trip in the extensive and inexhaustible territories of India. He was accompanied by his active wife, who served as his scientific assistant. From Burma, a mine of rich, ethnographic treasure and where the greatest part of their Indian stay was spent, their journey led the research couple into Assam, situated in the northeast of India, a country of equal significance. Assam certainly belongs politically to an-
101 terior India, but forms a bridge to interior India both ethnographically and linguistically.

Among the mountain peoples who inhabit the chain of hills which traverses the length of present-day Assam, and which separates the two largest parts of the country from each other, the Brahmaputra Valley in the north and the Surma Plain in the south, is one of the most interesting and doubtless the most advanced of the tribes, the Khasi, who inhabit the so-called Khasi and Jaintia Mountains. It
[631] was in Shillong, the center of this area, which is now the capital of the country Assam under the English government, where towards the end of September, 1911, I first became acquainted with Professor D. L. Scherman and his wife and where a friendship of many years
133 had its beginning. Therefore this little study will lead us to the Khasi Mountains, to its slopes overgrown with its peculiar pine trees, which receive greetings across the plains from the snow-crowned peaks of the Himalayas, which are flooded by the mighty waves of the Brahmaputra River and the alternating inundations of the Surma River. Here a contented and cheerful little people live who have maintained their own special characteristics in spite of the many European influences and those of neighboring cultures.

162 /128/ Of the entire population of 243,263 people, who form the inhabitants of the Khasi and Jaintai Mountains (1), 203,855 are Khasi.

1. The following statistical estimates are taken from the Census of India 1921, Vol. III, Assam, (Shillong, 1923) pp. I and II.

162
177 Of those, 37,852 have adopted Christianity, while the others are still adherents of ancient animistic cults, with the exception of somewhat

The STONE MONUMENTS *of the* KHASI HILLS. By C. B. CLARKE. [Communicated by Professor H. Fawcett, through Sir John Lubbock, Bart].*

131 THE Khasi Hills form a plateau, at a mean elevation of 4,500 feet above the sea, between the plain of Assam on the north and the plain of Sylhet on the south. They are inhabited by the 101 Khasi tribe, a people very distinct from the Hindoos north and south of them, and who are a branch of a race which extends eastward as far as South China. Immediately east of them are the Jaintea people, also called Sintengs, who are very closely allied in race and customs to the Khasi tribe. The 133 Jaintea country is physically a portion of the same plateau as the Khasi, and is only arbitrarily divided from it, and exhibits the same grassy hill-tops. The Khasi and Jaintea tribes together occupy the political district administered by the Deputy-Commissioner of Shillong, and the whole plateau is accordingly called the Shillong Plateau by Mr. Medlicott, the Dep.-Superintendent of the Geological Survey in India. Shillong is the English station which is the political capital. The plateau is remarkable for its freedom from the dense jungle which covers the neighbouring Himalayas at similar elevations; it is a fine rocky moor-like plateau, with isolated

* The woodcuts illustrating this paper have been kindly lent by Mr. Murray.

[p. 481]

10:Clarke U-3 (no date)1874 AR7 Khasi AR7

133 patches of open forest, and with scattered fir trees and oaks. Though south of the Himalaya range the character of the
137 country is more like that found in the Himalayas at 4,000 feet higher elevation, and many plants, never collected in the Himalayas below 9,000 feet above sea-level, are found in the Khasi Hills between 4,500—6,000 feet. In this marvellous plateau the sub-alpine and the sub-tropical forms overlap; at the very foot of elegant palms may be gathered the identical stag's horn moss, which, in Britain, is found only on mountains. On a fir tree much resembling a scraggy Scotch-fir is seen growing the Vanda cœrulea, the king of epiphytic orchids; a gnarled oak will carry a gigantic tropical liane; the painted lady and many other British species of lepidoptera will be accompanied by gorgeous tropical papilios and by window moths eleven inches across the wing; the cuckoo and Himalayan pheasant are above, while the tiger, the wild elephant and the green python are below. Justly has Dr. Hooker observed, "I know no spot in the world more calculated to fascinate the naturalist who, while appreciating the elements of which a landscape is composed, is also keenly alive to the beauty and grandeur of tropical scenery."

211 2. Almost throughout Khasi-land, and in a less degree through the Jaintea country, monumental stones are common. They are numerous in villages in the valleys, but are specially prominent, and sometimes of gigantic size, scattered over the rounded hill-tops where they form a feature in the landscape. In all modern treatises of Archæology and Anthropology the study of monumental stones forms an important chapter. Monuments of a remarkable similarity in design are found alike in Europe, Asia, and isolated islands in the Pacific Ocean, and these are in general of such extreme antiquity that they are treated as belonging to the prehistoric age. The Khasi stone monuments have attracted already much attention; first because of their great number and size; and, secondly and chiefly, because on these hills the erection of these monuments is now in full practice. It is reasonably supposed that a careful study of the Khasi method of raising the stones, and of the traditions or customs in accordance with which they raise them, may throw some light upon more ancient monuments of the same kind, even upon Stonehenge. It has been proposed to send out a commission from England to survey these Khasi stone monuments. They are described by Dr. Hooker, in his work (Min. Journ. II. 276), also by Colonel Raban in the *Calcutta Review*, and some account has been lately given by Major Godwin-Austen in the "Journal of the Anthropological Institute," No. 2, Oct. 1871.[1] The present memoir was written

CHAPTER I

INTRODUCTION

The homeland of the Khasi is the hilly country situated in the northeast of India and known at present as the District of United Khasi and Jaintia Hills, under the Assam State Government. The area is bounded by the plains of the Kamrup and the Nowgong Districts to the north, by the Cachar Hills and East Pakistan (District of Sylhet) to the south, and by the United Mikir and North Cachar Hills Districts to the east. The Khasi and Jaintia Hills are divided politically into two subdivisions, with headquarters at Shillong for the Khasi Hills, and at Jowai for the Jaintia Hills, respectively. The peoples of both subdivisions are called "Khasi" in a broad sense, and are distinctly marked off from other neighbouring tribes and peoples by language and social structure. The population of the Khasi in the District is 363,599 *(Census of India, 1951, Assam)*. Their language belongs to one of the Mon group of the Austro-Asiatic family to which the Munda in central India also belongs.[1]

Though all Khasis share fundamentally the same language and social structure, their culture, dialects, economy, social usage, and political organization vary greatly, owing to the ecological and politico-historical differences among them. The United Khasi and Jaintia Hills are much higher than the neighbouring Garo Hills. The plateau of the Khasi Hills ranges from about 5,000 feet to 6,000 feet, of which

1. The *Census of India, 1951, Assam*, makes the following remarks on their language: "Their nearest kinsmen have been discovered to be the Palaungs, a tribe inhabiting one of the Shan States to the northeast of Mandalay on the middle Salween. Later the relationship of the Khasi language has been traced not only to the Mon-Khmer language, but also to the Nicobarese and several dialects spoken by some tribes in the Malay Peninsula. In Assam, this special form of speech is only found in the Khasi and Jaintias while nearly all the other primitive languages with which it is surrounded belong to the great Bodo family. The Khasi language is the only member of the Mon-Khmer family which possesses a grammatical gender distinguishing all nouns as masculine and feminine, and here also the feminine nouns immensely preponderate."

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

133 the highest point is the Shillong Peak, 6,445 feet, covered with scrub, grassland and forests (mostly oak, rhododendron and pine trees). The 137 Jaintia Hills are considerably lower, with much flat land; wet paddy cultivation is practised here and there where sufficient water is available. From the plateau of the Khasi Hills northwards to the Assam Brahmaputra Valley there is a gentle slope covered with thick jungle, and the southern slope towards the Bengal plain is very steep, so that

101
102
619

MAP. . — *Map of the Khasi-Jaintia Hills with Classification of Groups.*

133 the upland remained practically cut off from the plains until the 137 middle of the 19th century.

Following the geographical and ecological differences, the five 619 groups are segregated into fairly well-defined cultural areas, each developing a different economy and dialect:

[131]
[24]

1. The Jaintia[1] — associated mostly with wet rice cultivation.
2. The Khasi (upland Khasi) — practise potato cultivation with small-scale rice and maize cultivation.
3. The War — inhabit the southern slope of the Khasi and Jaintia Hills (they are called geographically the Khasi War and the Jaintia War). Due to the heavy rainfall, the soil is the most fertile in the Khasi and Jaintia Hills. The Khasi War practise jhuming of which the main yield is millet. In the lower part of this area, pan-leaf, betel-nut, and orange gardens are cultivated. The Jaintia War practise wet rice cultivation like most of the Jaintias, as well as pan-leaf cultivation.

1. They are called also the Synteng or the Pnar.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

APPENDIX

SOME ADDITIONAL INFORMATION FROM SHELLA AND JATINGA

SHELLA

Shella is situated on the lowest of the southern slopes of the Khasi Hills, bordering on the Sylhet plain of East Pakistan. For centuries the people of Shella maintained close trading connections with the people of the plain, so that they have been much influenced by the Hindu. They have been to some extent divorced economically and culturally from their own people who live in the uplands and on higher part of the slopes. Actually, this is a natural result of their geographical location. From Cherrapunjee, the southern edge of the upland Khasi Hills, only a narrow footpath goes down to Shella. The altitude of Cherrapunjee is about 5,000 feet and of Shella from 500 to 1,000 feet, and the distance between them is 8 miles. The path descends very steeply and is full of hard stones. This difficulty of communication is also why the Hindu influence did not penetrate the upland Khasi, as in the case of the Jaintia Hills.[1]

This area has a unique political organization which differs from the majority of Khasi states who are traditionally ruled by the members of the Siem clan. Shella is organized as a confederation, called 'Shella Confederacy,' and consists of four local villages. The head of the village is called *wadadhar*, and is elected by the villagers every three years. The number of households of the Shella Confederacy was about 900 in January 1956. The names of the four villages and their *wadadhar* in 1956 were:

Name of village	*Name of wadadhar*
1. Shella	Devish Mohan Roy
2. Mushtoh	Ditojou Roy
3. Nongtrai	Orju Roy
4. Tyngnger	Jabuni Roy

Each village is divided into sections. For instance, Shella village has nine sections: (1) Jasir, (2) Disong, (3) Duba, (4) Jamau, (5) Nongrum, (6) Nongnong,

1. However, Shella was the only way out and the main gateway from the Khasi Hills to the plain; it was here that the British first entered the Khasi Hills. They proceeded from Shella to Cherrapunjee and made the latter headquarters of the Khasi Hills in 1833.

group of matrilineal and Mon-Khmer-speaking people who claim as their ancestral homeland the present-day United Khasi–Jaintia Hills District (within approximately 90° 47′ and 92° 52′ E. and 25° 5′ and 26° 5′ N.). This group includes the Jaintias (also Pnar or Synteng) in the southeast, who differ from the Khasis primarily in their duolocal residence pattern and less virulent forms of sorcery. (The Hadem in eastern Jaintia are a Kuki people.) It also includes the Lyngngams (also spelled Lynngam) in the west, who practice migratory swidden agriculture and certain peculiar funerary rites, and are said by Ehrenfels (1955) to be culturally intermediate between Khasis and Garos. Finally, it includes Bhois, Wars, and upland Khasis, which terms are primarily territorial. Bhoi country is the north-central part of the District, and is culturally complicated by the presence of Mikirs, Lalungs, and Nepalis. War country spans the entire southern length of the District, so that Wars divide into Jaintia Wars and Khasi Wars; of these, the Khasi Wars have traditionally transmitted property to sons as well as to daughters. The upland center of the District is the country of the Khasis proper, those whose culture provides the most useful model for interpreting the variations found elsewhere. [For general reference on all categories of Khasi culture, cf. Costa 1936 and 1937; also Gurdon 1907, especially for data on regional variations.] **Geography.** The District is 5,554 square miles of hilly tableland, intricately dissected by numerous rivers, and marked by significant ecological variation over very short distances. The tablelands step gently downward north from Shillong Peak, which at 6,445 feet is the highest point in the District, and over about 55 miles ease into the Brahmaputra valley where this is some 250 feet above sea level. To the south, the land slopes more steeply downward for about 20 miles, and then drops abruptly, in cliff and steep-slope formations, to the Ganges sea-level delta that begins at its north with Sylhet. The annual southwest monsoons drop torrential rains around Cherrapunji and Mawsynram villages (for Cherrapunji, a record 805 inches in 1861), but then, reaching Shillong 33 miles to the northeast, provide only about 100 inches per year. Rainfall is again greater in Bhoi, which shares the Brahmaputra valley climate. Climate is temperate on the high Shillong plateau, where it seldom freezes and never snows. To the north, climate becomes subtropical, forest is jungly, and fauna abound. The climate to the south is also subtropical. [Cf. Hooker 1891: chap. XXIX.] **Linguistic affiliation.** Khasi is one of the major Mon-Khmer languages, related to Mon, Khmer, Semang-Sakai, Nicobarese, and Palaung-Wa. The major Khasi dialects are Khasi, Jaintia, and Lyngngam, to which Grierson adds War. Further minor variations occur from village to village. The Khasis had no script until 1842, when the roman alphabet was successfully applied to the Cherrapunji dialect of Khasi proper. [Cf. Rabel 1961; Grierson 1903-28: 2; Bareh 1962.]

211 rude stone monuments. At the village of Nougshai, near
[101] Shillong, are to be seen some very striking monoliths; and
[131] although they do not come up quite to the length of those at Nurtiang (noticed by Dr. Hooker in his "Himalayan Journals"), yet they are very worthy of being mentioned. They stand on
[133] the open spur just above the village, and have been worked out of the beds of the Shillong sandstone series, and some of the smaller blocks have been taken from the conglomerate beds, the lowest in the series, and which come in, in the bed of the ravine, to the north of the spur. There are a number of monuments on this site, large and small, arranged both in line and on two sides of a square; the two largest have their central monoliths—height, 24 ft. 3 in.; width, 5 ft. 6 in.; thickness, 8 in.; and height, 23 ft. 2 in.; width, 2 ft. 9 in.; thickness, 1 ft., respectively.

[126 Plate ii., which is taken from a photograph by Mr. William Robert, Assistant Surveyor in the Khasi Hills survey party, gives an excellent idea of the second largest structure, showing the very massive flat-stone, the "Mao Kynthai," in front. This structure consisted of thirteen upright stones, which could not all be brought into the field of the camera; but the six outside stones on the right are shown. Many of the slabs in the
175 adjacent monuments have been overthrown and broken quite
211 recently, perhaps by Sepoys and camp followers from the military station close by. At one time a mountain battery of Eurasian Artillery was quartered there, and I attribute the overthrow of so many of the stones in the neighbourhood to their handiwork, who would look on such amusement as a "great lark." The Sepoy (native of India) is not of a mischievous disposition; the European and half-European (uneducated) is markedly so. Thus the monument with the highest stone is imperfect, and it must, when perfect, have been a very handsome one. This is a sad pity, after the time and labour that must have been expended in its erection.

361 I did not observe any new slabs anywhere in the immediate
1710 neighbourhood. Nougshai must formerly have been a large
[211] and powerful village; it stands on a naturally very strong position, and old lines of fortification are to be traced on many sides, especially on the approach from the direction of the Falls of the Umiam. These old lines of defence are on a curious system: a ditch and bank have been carried forward from the main defences from 200 to 300 yards down the ridge of the spurs, thus effectually preventing an enemy working round the hill sides below the villages.

174 This fortified site points to a state of things in these hills
912 when the relations between the large village communities or
628

CHAPTER II

General features of the district

128 2.1 In this chapter a brief note on the geography, population and economy of the district is given in order to provide a perspective and make the report self contained.

133 2.2 **Relief.**—The whole of the district is composed of hill tracts. On the northern and western border these hills take the form of tumbled ranges which run for the most part north and south and have a general height of two to three thousand feet. None of the hills in the central and southern portions of the district has anything rocky or precipitous about them. Their sides are covered with short grasses and from one direction or another, they can generally be negotiated by a man on horseback. There is a high plateau in the centre of the district, the general level of which is not much below 6000 feet though it decreases in height towards east and west.

2.3 **Rivers.**—The high plateau that traverses the centre of the district is the watershed of the hills. The following are the principal rivers. On the west there is the Jadukata, or Kynshi river, further east come the Um Maoda and the Bogani which fall into the Surma. The Umngot or Maheskhali, known as the Pyian Gang in the plains of Sylhet, forms for a considerable distance the boundary of the Khasi and Jaintia Hills. On the north the principal rivers are Kakhri, the Digaru and Umiam. Farther west comes the Umkhen, Um Myntang and the Mynriang. All these rivers possess the characteristics usually associated with hill streams. The beds are rocky and gravelly; the currents swift and after heavy rains even small streams come down in spate. The rivers of the district are not used for traffic to any appreciable extent.

135 2.4 **Minerals.**—The Geological products of economic value are lime and coal. From the earliest days of British rule, the lime quarries of Khasi Hills formed one of the principal attractions of Sylhet, drawing a large number of Europeans to that district. The lime quarries are situated all along the southern face of the hills. Coal is found both in the cretaceous and nummulitic formations. The largest deposits of nummulitic coal are found at Cherrapunjee, Laitryngew, Mawlong, Mustoh, Mawsynram, Mawdon, Thanjinath, Lakadong and Narpuh. Cretaceous coal is found in Maobchlarkar, Barsora, Wapung Laitkynsew and in the Langrin field.

137 2.5 **Forests.**—The district exhibits a varied flora reflecting the variations in the physical features, configuration of the ground, adaphic factors and climatic gradient. In the pine zone, covering areas between 2500'- 6200' elevation are found the pines, birch, schima, oak, beech, etc. The evergreen hardwood zone, which forms belt along the foothills contains useful hardwood species of which the most important species are sal, nahor, chain, chap, gomari, etc. The dry grassy belt covering the lower slopes roughly between 500'-2500' elevation form the ideal ground for graziers.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

175 Khásiás, have, ever since the measures of improvement which
648 followed, remained peaceable and contented.

General Aspect of the District.—The District consists
133 almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is steep, until a table-land is met with at an elevation of about 4000 feet. Higher up there is another plateau at Máo-flang, ten miles to the eastward of which, and in the same mountain range, the Civil Station of Shillong is situated at an elevation of 4900 feet above sea level. On the northern side of the hills are two plateaux, one between 1000 and 2000 feet below the level of Shillong, and the second lower down, about 3000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken
137 here and there by the valleys of the larger hill streams. In the higher ranges, where the hills have been denuded of forest, the country is covered with short grass, which becomes longer and more rank in the lower elevations. A remarkable feature in the
[778] aspect of the country throughout the hills is the numerous sacred groves which superstition has preserved from time immemorial from the destructive hand of the woodcutter. These sacred groves contain beautiful timber-trees of various kinds, rare orchids, rhododendrons, and wild cinnamon. On the more elevated table-lands, pine trees and stunted oak are met with; and in the lower hills, in every direction, are dense forests of the usual Indian trees, containing valuable timber.

134 The geological formation is mainly granitic, with stratified rocks
135 of sandstone, limestone, and shale. The coal-beds rest on trap and metamorphic rocks. The prevailing surface soil is a red ferruginous loam.

133 Mountains.—The principal mountain ranges and highest peaks in the Khási and Jáintiá Hills are as follow:—(1) The Shillong range—height of principal peak, 6449 feet above sea level. (2) Dingiei range—principal peak, 6400 feet. (3) Máo-thad-ráí-shán range—highest peak, 6297 feet. (4) Láo-syn-niá range—highest peak, 5775 feet. (5) Láit-máo-doh range—highest peak, 5377 feet. (6) Láo-ber-sát—highest peak, 5400 feet. (7) Láo-bah range—highest peak, 4464 feet. (8) Lyng-ker-dem range—highest peak, 5000 feet. (9) Lúm-baiong range—highest peak, 4646 feet. (10) Máo-syn-rám range—highest peak, 5810 feet.

The principal mountains are:—(1) Rap-leng—height, 5671 feet.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

(2) Soh-pet-byneng, literally 'The Navel of the Sky.' This is supposed by the Khásiás to be the centre of the world, and to be the highest peak in the hills. Its real altitude, however, is only about 4000 feet. (3) Sywer—height, 6050 feet. (4) Shillong—height, 6449 feet. (5) Dingiei—height, 6400 feet. (6) Kyl-lang rock, one huge mass of stone, about 500 feet high, and of a rounded form—height above sea level, 5684 feet. (7) Láit-blih—height, 5800 feet. (8) Láit-derá—height, 6000 feet. (9) Thanji-náth—height, 4448 feet. (10) Nong-jrong—height, 4995 feet. (11) U Mún—height, 6221 feet. (12) Máo-flang—height, 5931 feet. (13) Máo-ká-leng—height, 5900 feet. (14) Már-py-nuá—height, 5600 feet. (15) Symper—height, 5700 feet. (16) Máo-sngi—height, 5810 feet. (17) Láit-már-kán—height, 5313 feet. (18) Nong-syn-rih—height, 5585 feet. (19) Más-keyn—height, 5306 feet. (20) Nong-khrong—height, 5606 feet. (21) Kalái-long-sngún—height, 5128. (22) Máo-lih-bah—height, 4252 feet. (23) Pattar-kyl-lang—height, 5755 feet. 133 •

The mountain peaks are of various forms and shapes, but generally conical, and capped by sacred groves. No roads exist to permit the ascent of carriages, but most of the hills can be ascended by beasts of burden, even without made tracks. In the eastern portion of the District the hills are covered with forest. 491 137

RIVERS.—No navigable rivers flow through the hills, the streams being all mountain torrents. On some of the large streams, however, near the point where they debouch upon the plains, small canoes are used for short distances below the rapids. The principal streams flowing south to the Surmá river in Sylhet are the following:—(1) The Kyn-chi-ong, named Jádukátá by the Bengális in the plains; (2) the Tanglá, called Mukái in the plains; (3) the Bograh, called Bogápání in the plains; (4) the Soh-ryng-kew, called Dhulái in the plains; (5) the Mungít, called Pein in the plains; (6) the Mán-tyh-du, called Hári in the plains; and (7) the Lukí or Lubá. The principal tributaries to the Brahmaputra are:—(1) The Kapilí; (2) the Um-khen, called Barpáni in the plains; (3) the Um-ifm; (4) the Um-tru, called Digru in the plains; and (5) the Ka-khri, called Kulsi in the plains. All the foregoing streams have numerous feeders of their own, but none of them are of any importance. 133 [501]

The Khási and Jáintiá Hills are, like all mountainous countries, intricately watered, and the streams run over rocky beds, some passing through cultivated lands. As they approach the plains,

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

133 they form rapids, the waters precipitating themselves down deep, rocky gorges and chasms, choked with huge boulders. Some of these gorges are very beautiful; the streams, being hemmed in between stupendous mountains and rocks covered with primeval forest, run in narrow but very deep channels swarming with fish. No islands or lakes are formed by any of the rivers, although several of them have large, deep pools. They are all unfordable during the rains.

312 UTILIZATION OF THE WATER SUPPLY.—None of the rivers are utilized as a motive power for turning machinery, although the streams on the higher plateaux might be easily turned to such an account. Their waters, however, are extensively used for the purposes of irrigation, and the hill people display great ingenuity in cutting channels or aqueducts for leading the water on to their [365] fields. It is in this manner that the Civil Station of Shillong receives its water supply. Aqueducts convey water to the houses of all the European residents; and branch channels from the main aqueduct flow through the *bázár*, and along the streets occupied [226] by the native inhabitants. No fishing towns exist in the hills; but [563] near where the rivers debouch upon the plain are some valuable fisheries, which are annually let in farm, the lessees being generally Bengális. These fisheries yield an annual Government revenue of about £300. Embankments in order to protect the land against floods do not exist. A few embankments, or rather dams, are thrown across narrow valleys between hills, so as to create reservoirs for water. At Shillong there are a few tanks thus formed, which are both useful and ornamental.

135 MINERALS, ETC.—Coal and limestone, both of excellent quality, are found in abundance. Lower Bengal obtains nearly the whole of its lime supply from the Khási and Jáintiá Hills. The lime is known as 'Sylhet lime,' and is obtained by quarrying from the beds of stone which line the base of the mountains along the whole length of the Sylhet boundary. The supply is literally inexhaustible. Coal out-crops at Cherrá Pánji, Lá-kí-long, Shellá, Mío-ym-ním, and at several other places; but as a rule it is scattered, and found in places difficult of access. The coal, however, is of excellent quality, and leaves very little ash. Stone, well adapted for building purposes, is also found. Ironstone exists almost everywhere throughout the Hills, but principally in the dependent States of Khyrim, Nongpung, Cherrá, and Mylliem. In former years the Khásás were 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

In former years the Khásiás were great iron-smelters, and enormous excavations in the most favourable localities for obtaining ironstone prove the extent to which this manufacture was carried on. In some places the whole surface of the ground appears to have been dug up for a depth of several feet, leaving huge boulders standing up here and there. Of late years, however, as the price of labour in the Hills has risen, the trade in iron has died away, and there is now little demand for the Khási article, the cheaper English metal having driven it out of the market. 178 316 325

NATURAL PHENOMENA.—Many peculiar caves and caverns are found in the limestone rock formation, the most notable being the caves at Cherrá Pinji and at Rápnáth in Amwi. At the latter place the caverns extend a great distance beneath the earth, one being imagined by the people to reach as far as China, and a Hindu legend states that a Chinese army once marched by this route to the invasion of India. In another cave, the limestone stalactites have been carved into images representing the gods of the Hindu pantheon. On the banks of the Kapili river on the Cáchár border, at a place called Sumir, there is a hot spring, the water of which contains carbonate of lime. All the rivers in the Hills flow through gorges in certain parts of their course, the most picturesque being at Tobrá, where a small stream is compressed into deep pools among limestone rocks; and at Dumang and Borghát, where the Mangot and Mantidoo rivers respectively debouch upon the plains. 133 [323]

FORESTS, ETC.—The India-rubber or caoutchouc tree is found in many forests throughout the Hills, but not in great numbers, and the supply and value of the gum has much decreased of late years. In 1870 the right of tapping the trees in the Jíntiá Hills was leased out for a sum of £56, 12s. 0d.; but by 1876 the trade had almost entirely ceased. There are some tracts of timber forest on the lower hills towards the Brahmaputra valley, but through the want of water carriage they are of no great value. Vigorous efforts are being made to preserve the forests in the higher plateaux. Owing to the habit of firing the jungle in spring prior to sowing, great waste of valuable timber has taken place; but since the country has been separated from Bengal and placed under the administration of the Chief Commissioner of Assam, attention has been given to the matter, and special areas are now being set apart for the preservation and growth of forest timber. Cinnamon grows wild in some parts of the country. There is a considerable trade carried on in 137 [314] 137 648 659 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

132 in 1876, the highest maximum temperature was registered in the month of August, the lowest minimum in January. From November until the end of March the weather is dry and bracing. Hoar-frost lies upon the ground almost every morning in the months of December, January, and February. Shallow water occasionally freezes over, but snow never falls.

The rainfall at Cherrá Pínji is enormous, varying between 300 and 500 inches per annum. The heaviest fall is in the months of June and July. As much as 30 inches has been collected in one day in July, and 157 inches has been registered as the total rainfall of that month. The average rainfall of the three years ending in 1876 is returned at 368·41 inches. It is affirmed that a total of 805 inches fell in 1861, of which 366 inches is assigned to the single month of July. This excessive rainfall can be readily accounted for by the abrupt manner in which the hills at Cherrá Pínji rise from the plains on the south. The vapour-bearing breezes of the south-west monsoon, sweeping across the heated, flooded plains of Lower Bengal, suddenly strike against the hills. The vapour as it ascends gets condensed into fogs and mists, and finally, when it reaches the crest of the range, discharges itself in torrents of rain, unequalled by that recorded in any other part of the world.

At Shillong, which is only 30 miles north and a little higher than Cherrá Pínji, the average rainfall is only about 85 inches; but between these two Stations three higher ranges intervene, which deprive the clouds in passage of a considerable portion of their moisture. During the three years ending in 1876, the average rainfall at Shillong was 85·65 inches.

The rainfall at Jowái, a subdivisional Station in the Jáintiá Hills, 26 miles distant from the plains, holds a mid place between that of Cherrá Pínji and Shillong, and is estimated at 150 inches in the year. During the three years ending in 1876, the average rainfall at Jowái was 145·60 inches; but in the last of these years alone as much as 309·21 inches was registered, of which 134·34 inches fell in the month of June.

• 133 The District is liable to shocks of earthquake. In September 1875 considerable damage was done to the houses in Shillong by a shock which extended with great severity as far as Gauhátí; and several minor shocks were experienced in the year 1876-77.

164 132 DISEASES, ETC.—Generally speaking, the climate of Shillong is pleasant and congenial to Europeans. English children thrive

I. Setting and Economic Background of Sohkyndih and Kongton

361 Sohkyndih and Kongton are villages of the Kadashinong,[1] one of
692 the areas under the Cherra Chief. The Kadashinong is situated on
[131] the southern slope of the Khasi Hills, in what is called War country.
These two villages are situated at the farthest point from both Shella,
the centre bordered by the plain, and Cherrapunjee, the seat of the
184 Cherra Chief, one of the centres of the upland Khasi Hills. The people
121 at Cherrapunjee say that these villages are one of the most backward
[171] parts of the Khasi Hills. They correspond to Rombagiri in the Garo
Hills, as they lie in the innermost parts and more traditional economic
and social settings have been preserved there than in other villages.
These are also the reasons why I selected those villages as my field.

361 It is nine miles to Sohkyndih from Cherrapunjee, crossing two
[131] deep valleys towards the east. Kongton is located at the heart of
[487] the mountain ranges, ten miles from Cherrapunjee, towards the north-
east. It is about twelve miles from Sohkyndih to Kongton, and
[162] the way leads through one of the most difficult passes, where even
villagers seldom travel. In December, 1955, Sohkyndih was a com-
munity of 48 households (List 6), and Kongton of 62 households
(List 9). The settlements of both villages are clustered in the southern
depressions of a mountain, not far from the summit, a typical location
[134] of Khasi villages. Sohkyndih has poor soil, covered with plenty of
pieces of stones. The yield therefore is very poor. On the other
hand, Kongton, a much older village, enjoys fertile soil, and is one of
the most prosperous communities in the Kadashinong.

241 The major economy of both villages is shifting cultivation. We
have already seen, in the chapters on the Garo, the fundamental
technique of "Jhuming cultivation." The differences between the
423 Garo and the Khasi shifting cultivation are to be found in two aspects:
one is the nature of the crops and the other is the type of landowner-
[171] ship. In this area, the main crop is millet, while that of the Garo is
[241] rice. Besides the shifting cultivation, the Khasi have [illegible]
and sometimes pineapple gardens, though on a small scale and not
in every household. The most important feature of Khasi shifting
cultivation is the development of private ownership. In the tribal
areas in Assam, such private ownership of the jhum field is quite un-

1. Kadashinong is the name of a group of villages. Its literal meaning is "twelve villages," and it comprises the following villages: Sohkyndih, Rymmai, Mawbawon, Mawshisit, Mawmang, Kongton, Shwetong, Kodhupthiat, Pilli, Tendon, Nongpyrang, and Dongpaw. (Khasi spelling follows the customary usage in Cherra State.)

[illegible] the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contended that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, trying cases of heinous crimes, approving the popular selection of any new chief and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Hills (vol.) - (1) The British introduced the potato which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive speculation exhausted the soil and made far-reaching changes. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should observe practices that traditionally was outmoded for lack of relevance of non-Christian religious rituals. (3) About 1866 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to mingle with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the widespread enrollment in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi-Jaintia Hills District became a Part B, or autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The subversion system and the chiefs and rent, and the District Council, lack a difficult to effect legislation which a nation offensive to regional culture are a simple blueprint of drifting all India is between Jaintias, who are accustomed to central and authority and taxation, and Khasis, who resent the notion of taxation to support the work of a central District Council. (2) Cat 1000, [illegible] Khasis 1000, Wang 1000.

SETTLEMENT PATTERN AND MORTAR: Settlement patterns. Khasis live primarily in nuclear, nucleated, and clustered villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a do-

[illegible] Khasis, here, ever since the measures of improvement which followed, remained peaceable and contented.

[illegible] GENERAL ASPECT OF THE DISTRICT.—The District consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is steep, until a table-land is met with at an elevation of about [illegible] feet. Higher up there is another plateau at Nongkhlaw, ten miles to the eastward of which, and in the same mountain range, the Civil Station of Shillong is situated at an elevation of [illegible] feet above sea level. On the northern side of the hills are two plateaus, one between [illegible] and [illegible] feet below the level of Shillong, and the second lower down, about [illegible] feet above sea level. In general features all these plateaus are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where the hills have been denuded of trees, the country is covered with short grass, which becomes longer and more rank in the lower elevations. A remarkable feature in the aspect of the country throughout the hills is the numerous sacred groves which superstition has preserved from time immemorial from the destructive hand of the woodcutter. These sacred groves contain beautiful timber-trees of various kinds, rare orchids, rhododendrons, and wild cinnamon. On the more elevated table-lands, pine trees and stunted oak are met with; and in the lower hills, in every direction, are dense forests of the usual Indian trees, containing valuable timber.

[illegible] The geological formation is mostly granitic, with stratified rocks of sandstone, limestone, and shale. The rock beds rest on trap and metamorphic rocks. The prevailing surface soil is a red ferruginous loam.

[illegible] MOUNTAINS.—The principal mountain ranges and highest peaks in the Khasi and Jaintia Hills are as follows:—(i) The Shillong range—height of principal peak, [illegible] feet above sea level. (ii) [illegible] range—highest peak, [illegible] feet. (iii) Lika-syi-ruid range—highest peak, [illegible] feet. (iv) Lika-mlo-doh range—highest peak, [illegible] feet. (v) Lika-ber-ch—highest peak, [illegible] feet. (vi) Lika-bah range—highest peak, [illegible] feet. (vii) Lang-kor-dow range—highest peak, [illegible] feet. (viii) Lum-lalong range—highest peak, [illegible] feet. (ix) Mlo-sya-ram range—highest peak, [illegible] feet.

The principal mountains are:—(i) Rup-lang—height, [illegible] feet.

20: Mundy G-4 (no date) 1897 AR? Khasi AR?

extent of waste land, some is cultivated in a manner resembling the jum system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *jhum* tenure. Any owning of land is unknown, and there are no recognized rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 [427]

Manure is generally used in raising rice and potatoes. It is seldom purchased, the dung and litter of the cattle and other animals about the house being generally utilized for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 10. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 10s. to 18s. per acre. 243 244 [435]

Irrigation for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills. 312

Model Farm.—The Shillong Model Farm, established in 1871, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red maple' and 'pheasant's eye'—were successfully introduced in 1893-94, but these are not looked upon favourably by the Khásiás, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, mulberry, and plum; and the tables of the European gardeners are supplied with vegetables from the garden attached to the Model Farm. [illegible] the experimenters has been transferred into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the unfitness of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1894-95 the sum of Rs. 1,344 177 177 244 [illegible] 654 177 245 [illegible] 654 [134] [134] 231 648 654

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

157 in the Jowai sub-division. In the vicinity of Nongpoh is observed the beautiful *sakor* or *sapowar*, the iron-wood tree. The latter is also to be found on the southern slopes of the hills in the Jowai sub-division. There are some *sal* forests to the west and south of Nongpoh, where the *sal* trees are almost as large as those to be found in the Garo Hills. Between Shillong and Jowai there are forests of oak, the country being beautifully wooded. Chestnuts and birches are also fairly common. The low hills on the northern and western sides of the district are clad with dense forests of bamboo, of which there are many varieties. The Pandanus or screw-pine is to 136 be met with on the southern slopes. Regarding the geological 133 formation of the hills, I extract a few general remarks from the Physical and Political Geography of Assam. The Shillong plateau consists of a great mass of gneiss, here on the northern border, where it is broken into hills, for the most part low and very irregular in outline, with numerous outliers in the Lower Assam Valley, even close up to the Himalayas. In the central region the gneiss is covered by transition or sub-metamorphic rocks, consisting of a strong band of quartzites overlying a mass of earthy schists. In the very centre of the range, where the table-land attains its highest elevation, great masses of intrusive diorite and granite occur; and the latter is found in dikes piercing the gneiss and sub-metamorphic series throughout the southern half of the boundary of the plain. To the south, in contact with the gneiss and sub-metamorphics is a great volcanic outburst of trap, which is stratified, and is brought to the surface with the general rise of elevation along the face of the hills between Shella and Thringhat south of [illegible] which are called collectively the Cherra trap. South of the main axis of this metamorphic and volcanic mass are to be found strata of two well defined series: (1) the cretaceous, and (2) nummulitic. The cretaceous contains several important coal-fields. The nummulitic series, which overlies the cretaceous, attains a thickness of 500 feet in the Thevia river, consisting of alternating strata of compact limestones and sandstones. It is at the exposure of these rocks on their downward dip to the edge of the plateau that are situated the extensive limestone quarries of the Khasi Hills. There are numerous

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

limestone caves and underground water-courses on the southern face of the hills. This series contains coal-beds, e.g. the Cherra-field and that at Lakadong in the Jaintia Hills. Some description of the remarkable Kyllang Rock may not be out of place. Sir Joseph Hooker describes it as a dome of red granite, 5,400 feet above sea level, accessible from the north and east, but almost perpendicular to the southward where the slope is 80° for 600 feet. The elevation is said by Hooker to be 400 feet above the mean level of the surrounding ridges and 700 feet above the bottom of the valleys. The south or steepest side is encumbered with enormous detached blocks, while the north is clothed with forests containing red tree-rhododendrons and oaks. Hooker says that on its skirts grows a "white bushy rhododendron" which he found nowhere else. There is, however, a specimen of it now in the Shillong Lake garden. Numerous orchids are to be found in the Kyllang wood, notably a beautiful white one, called by the Khasis *u'lior kyllang synrai*, which blooms in the autumn. The view from the top of the rock is very extensive, especially towards the north, where a magnificent panorama of the Himalayas is obtained in the autumn. The most remarkable phenomenon of any kind in the country is undoubtedly the enormous quantity of rain which falls at Cherrapunji.* Practically the whole of the rainfall occurs in the rains, i.e. from May to October. The remainder of the district is less rainy. The climate of the central plateau of the Shillong range is very salubrious, but the low hills in parts of the district are malarious. The effect of the different climates can at once be seen by examining the physique of the inhabitants. The Khasis who live in the high central plateaux are exceptionally healthy and strong, but those who live in the unhealthy "Bhoi country" to the north, and in the Lyngngam [illegible] in the west of the district, are often stunted and sickly. Not so, however, the Wars who live on the southern slopes, for although their country is very hot at certain times of the year, it does not appear to be abnormally unhealthy except in certain

* The average rainfall at the Cherrapunji Police Station during the last twenty years, from figures obtained from the office of the Director of Land Records and Agriculture, has been 426 inches. The greatest rainfall registered in any one year during the period was in 1906, when it amounted to 641 inches.

10: Clarke U-3 (no date)1874 AR7 Khasi AR7

In these hills a dozen monuments on the binary type may soon be found in which there are two equal upright slabs in the middle, and the other stones placed symmetrically on each side of them.

7. There are three kinds of rock employed by the Khasis for stone monuments, viz.:—

a. The Cherra sandstones.
b. The Shillong sandstones.
c. The granite.

Small stones are conveyed considerable distances from the place of manufacture before they are set up—large stones are not—hence the material of the monuments is determined everywhere geologically.

a. The Cherra sandstones are tertiary and cretaceous rocks spread along the southern edge of the plateau and producing the ledges which mark its abrupt termination. In the great thickness of these sandstones are many beds in which the rock occurs in large sheets with very few joints, and well-adapted for working out large slabs therefrom. The sandstone is generally very hard, but not so hard but that the Khasis can work it with their own native-made iron tools.

There is a quarry, now in full work, about half-a-mile out of the old Cherra cantonment, upon the Mawloo path, where slabs may be seen in preparation. The slabs made from the Cherra sandstones, admitting of being worked, are generally hewn pretty fairly to a shape and smoothed before being set up. The ancient monuments are, however, often made of very rough slabs.

All the well-known monuments near the old Cherra station are made of these sandstones, as also the large monuments at Mawloo, Mawsmai, and Lirinow. These three monuments all stand on sheets of Cherra sandstone and the stones were cut out of the rock hard by where they now stand. The stones quarried now outside the Cherra cantonment, being for transport, are none of great size.

The Khasis also work gigantic slabs of stone for bridges. Where the span is anything under twenty feet a single slab [illegible] of enormous blocks of sandstone are raised on each side, on which the slab may rest, if there is the remotest fear that the water can, in any flood, reach the under surface of the slab. As compared with such a bridge the Khasis regard the best efforts of the English engineers as mere makeshifts. The arch at Amwee figured by Dr. Hooker is Bengali work.

b. The Shillong sandstones extend over a large area of the northern portion of the plateau: they are often more argillaceous

10:Clarke U-3 (no date)1874 AR7 Khasi AR7

135 (sometimes slaty) than the Cherra sandstones, and are geologically ancient, probably being of palæozoic age, but containing no fossils. They are generally inclined at high angles and the beds are full of joints, and do not admit of large slabs being got out of them. I know of no monument of the first class made out of 211 Shillong rocks, but slabs of six feet high are very common. They are generally obtained by splitting out with wooden wedges and are not often finished with iron tools. The monuments on the Shillong sandstone area are therefore of a much rougher character than the Cherra monuments, the stones irregular in shape, and the stones that should correspond in size only corresponding very roughly. It is often very difficult to say whether these monuments are of the regular 3-5-7 stoned type or not, but they all are designed in general accord with the two great types of upright and horizontal slabs.

135 *c.* A large area, perhaps 1,000 square miles, of the Shillong plateau, is covered with scattered blocks of granite, varying in size up to masses as large as cottages: perhaps the Kollong rock itself (figured by Hooker) might be counted as the extreme size

211

135 such blocks here reach. This granite area runs east and west through the centre (or somewhat through the northern half) of the plateau. It is of great width and continuity westward, becomes broken into isolated areas in the centre of the hills, and becomes very narrow in the Jâintea territory, finally dying out

10: Clarke U-3 (no date)1874 AR7 Khasi AR7

in East Jaintea, according to the Khasis, who are good geologists. 135

These granite blocks are found on the steep hill sides and on the hill tops, the valleys between being often entirely destitute of them. The highest hills of the plateau are especially favoured with them as Nonglas (Nunklow) and Laitlankote. On the edges of the granite area and on the isolated peaks of the country, outlying heaps of granite blocks are found. Around Jowye (the Jaintea capital), the country is very uniformly at a level of about 4000–4500 feet above the sea, and not a granite block is to be seen there, nor in marching east thence, where you keep at the same level, until you reach the Ralliang hill about twelve miles east of Jowye, where the blocks appear again in full force all over the summit of the hill.

From these granite blocks, slabs of almost any size might be obtained, but the Khasi native iron tools will not work this granite, which is very hard, and the granite slabs used in the Khasi monuments are merely flakes obtained by heating the block with fire along a line and then pouring cold water upon it. The upright granite slabs thus frequently exhibit one convex and one concave face, as also do the horizontal slabs which are round or oval, not quadrangular. The flakes are entirely unworked in the Khasi territory, so that the granite monuments have an extreme rudeness and ruggedness about them which has been commonly supposed to indicate extreme antiquity. This I believe is altogether a mistake, but at the present time the taste of the people appears educated up to a preference for worked stones, and I have not seen any granite monument in process of construction, though I am told that many have been made within the memory of man. 316

There is an important difference in the Jaintea granitic monuments which are neatly worked to the approved form. The Bengali Rajahs of the plains, Jaintea and Jaintaspore, have long established an influence in the hills, and Bengali workmen have thus penetrated the hills from Jaintaspore by Amwee up to Jowye, the hill capital, and further. The Bengali tools are able to [illegible] for monuments or for bridges, are commonly found neatly hewn, all the way from Jaintaspore up to Nartiung, north of Jowye.

Large granite stones are rather more difficult to move than sandstones of the same dimensions, and the first class granite monuments are found on the spot where the granite blocks abound. Where an isolated hill was covered with large blocks, and no blocks were seen anywhere else near, this seems at once to have suggested such a hill as a suitable spot for monumental erections. In just the same way at Stonehenge the large stones

CHAPTER II

General features of the district

128 2.1 In this chapter a brief note on the geography, population and economy of the district is given in order to provide a perspective and make the report self contained.

133 **2.2 Relief.**—The whole of the district is composed of hill tracts. On the northern and western border these hills take the form of tumbled ranges which run for the most part north and south and have a general height of two to three thousand feet. None of the hills in the central and southern portions of the district has anything rocky or precipitous about them. Their sides are covered with short grass and from one direction or another, they can generally be negotiated by a man on horseback. There is a high plateau in the centre of the district, the general level of which is not much below 6000 ft though it decreases in height towards east and west.

2.3 Rivers.—The high plateau that traverses the centre of the district the watershed of the hills. The following are the principal rivers. In the west there is the Jadukata or Kynshi river, further east cor the Um Mantha and the Bogapani which fall into the Surma. The Umgot or Mahrokhah, known as the Pylon Gang in the plains of Sylhet forms for a considerable distance the boundary of the Khasi and Jaintia Hills. On the north the principal rivers are Kakhri, the Digaru and Umiam. Farther west comes the Umkhen, Um Myntang and the Myrang. All these rivers possess the characteristics usually associated with hill streams. The beds are rocky and gravelly, the current swift and after heavy rains even small streams come down in spate. The rivers of the district are not used for traffic to any appreciable extent.

135 **2.4 Minerals.**—The Geological products of economic value are lime and coal. From the earliest days of British rule, the lime quarries of Khasi Hills formed one of the principal attractions of Sylhet, drawing large number of Europeans to that district. The lime quarries are situated all along the southern face of the hills. Coal is found both in the cretaceous and nummulitic formations. The largest deposits of nummulitic coal are found at Cherrapunjee, Laitryngew, Mawlon Mawsynram, Mowdon, Thangjrath, Lakadong and Narai. Cretaceous coal is found in Mooleblakar, Berseu, Wapung Laitkynsew and in the Langrin field.

137 **2.5 Forests.**—The district exhibits a varied flora reflecting the variations in the physical features, configuration of the ground, edaphic factors and climatic gradient. In the pine zone, covering areas between 2500'-6200' elevation are found the pines, birch, uhima, oak, beech, etc. The evergreen hardwood zone, which forms belt along the foothills contains useful hardwood species of which the most important species are sal, nahor, cham, chap, gomari, etc. The dry grass belt covering the lower slopes roughly between 500'-2500' elevation form the best ground for grasses.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

homicide), in which their own subjects are concerned. All cases of homicide, or matters involving disputes between people belonging to different States, are adjudicated upon by the British officers of the District. 648 692

In the British possessions, the principal sources of revenue are rents and royalties derived from mineral workings, such as lime and coal; rents of fisheries; and a house tax, which varies, according to situation and productiveness of the soil, from R. 1 to Rs. 2 or from 2s. to 4s. per house. A land tax is only levied in tracts where the Government possesses the actual proprietary right in the soil. Again, in the Khási States, the British Government, which undertakes the management of the natural products of the country, such as waste lands, coal, lime, etc., receives a half-share of the rents realized from these sources, the other half belonging to the native Chiefs. The other sources of revenue of the Chiefs are market dues, cesses levied occasionally for State purposes, and fines realized in the administration of justice. 648 651 [135]

HISTORY.—Our first knowledge of the Khási Hills dates from the time when the East India Company acquired the *diwani* of Bengal in 1765. The adjoining District of Sylhet was included in that grant; but as the hillmen had never acknowledged any subjection to the Muhammadans, so they still remained absolutely independent of the British power. However, the necessities of commerce, arising from their monopoly of the lime quarries, from which Bengal has drawn its supply from time immemorial, soon attracted European enterprise to the country. As stated in the Appendix to the Statistical Account of Sylhet, the control of the profits of the lime trade formed in early times one of the most valuable advantages attaching to the position of the official in charge of that District. It does not appear that any European had been attracted to reside in the Hills before 1826. In that year the Raja of Nongkloo entered into an agreement with certain European British subjects to allow a road to be made across the Hills, to connect the Surma valley with Assam Proper. These Europeans took up their residence at Nongkloo. Misunderstandings unfortunately arose, and, partly by the misconduct of some of their Bengali followers, the growing discontent and apprehension were fanned into a flame. On 4th April 1829 the Khásiás rose in arms and massacred Lieutenants Bedingfield and Burlton, together with some sepoys. This led to military operations on the part of the British Government, which 175 648 [135] [437]

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

175 Khásás, have, ever since the measures of improvement which
648 followed, remained peaceable and contented.

General Aspect of the District.—The District consists
133 almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is steep, until a table-land is met with at an elevation of about 4000 feet. Higher up there is another plateau at Máo-flang, ten miles to the eastward of which, and in the same mountain range, the Civil Station of Shillong is situated at an elevation of 4900 feet above sea level. On the northern side of the hills are two plateaux, one between 1000 and 2000 feet below the level of Shillong, and the second lower down, about 3000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken
137 here and there by the valleys of the larger hill streams. In the higher ranges, where the hills have been denuded of forest, the country is covered with short grass, which becomes longer and
[778] more rank in the lower elevations. A remarkable feature in the aspect of the country throughout the hills is the numerous sacred groves which superstition has preserved from time immemorial from the destructive hand of the woodcutter. These sacred groves contain beautiful timber-trees of various kinds, rare orchids, rhododendrons, and wild cinnamon. On the more elevated table-lands, pine trees and stunted oak are met with; and in the lower hills, in every direction, are dense forests of the usual Indian trees, containing valuable timber.

134 The geological formation is mainly granitic, with stratified rocks
135 of sandstone, limestone, and shale. The coal-beds rest on trap and metamorphic rocks. The prevailing surface soil is a red ferruginous loam.

133 Mountains.—The principal mountain ranges and highest peaks in the Khási and Jaintiá Hills are as follow:—(1) The Shillong range—height of principal peak, 6449 feet above sea level. (2) Dongiei range—principal peak, 6400 feet. (3) Máo-thad-ei-shin range—highest peak, 6297 feet. (4) Lúo-syn-nid range—highest peak, 5775 feet. (5) Lúit-máo-dah range—highest peak, 5377 feet. (6) Lúo-ber-sit—highest peak, 5400 feet. (7) Lúo-bah range—highest peak, 4264 feet. (8) Lyng-ker-dem range—highest peak, 3000 feet. (9) Lúm-luiong range—highest peak, 4646 feet. (10) Máo-syn-rim range—highest peak, 5810 feet.

The principal mountains are:—(1) Rap-leng—height, 3671 feet.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

133 they form rapids, the waters precipitating themselves down deep, rocky gorges and chasms, choked with huge boulders. Some of these gorges are very beautiful; the streams, being hemmed in between stupendous mountains and rocks covered with primeval forest, run in narrow but very deep channels swarming with fish. No islands or lakes are formed by any of the rivers, although several of them have large, deep pools. They are all unfordable during the rains.

312 Utilization of the Water Supply.—None of the rivers are utilized as a motive power for turning machinery, although the streams on the higher plateaux might be easily turned to such an account. Their waters, however, are extensively used for the purposes of irrigation, and the hill people display great ingenuity in cutting channels or aqueducts for leading the water on to their [365] fields. It is in this manner that the Civil Station of Shillong receives its water supply. Aqueducts convey water to the houses of all the European residents; and branch channels from the main aqueduct flow through the *bázár*, and along the streets occupied [226] by the native inhabitants. No fishing towns exist in the hills; but [563] near where the rivers debouch upon the plain are some valuable fisheries, which are annually let in farm, the lessees being generally Bengalis. These fisheries yield an annual Government revenue of about £300. Embankments in order to protect the land against floods do not exist. A few embankments, or rather dams, are thrown across narrow valleys between hills, so as to create reservoirs for water. At Shillong there are a few tanks thus formed, which are both useful and ornamental.

135 Minerals, etc.—Coal and limestone, both of excellent quality, are found in abundance. Lower Bengal obtains nearly the whole of its lime supply from the Khásí and Jaintia Hills. The lime is known as 'Sylhet lime,' and is obtained by quarrying from the beds of stone which line the base of the mountains along the whole length of the Sylhet boundary. The supply is literally inexhaustible. Coal out-crops at Cherrá Pínji, Lá-ká-dong, Shellá, Máo-syn-rám, and at several other places; but as a rule it is scattered, and found in places difficult of access. The coal, however, is of excellent quality, and leaves very little ash. Stone, well adapted for building purposes, is also found. Ironstone exists almost everywhere throughout the Hills, but principally in the dependent States of Khyrim, Nongpoh, Cherrá, and Mylliem. In former years the Khásís were
000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

491 Pínji, and Tharighát, to Bholáganj in Sylhet; length, about 130 miles. Repairs to this road are effected partly by the inhabitants of the Native States, and partly by Government. (3) Cart road from Shillong to Máo-ílong, 14 miles. This road has been opened for cart traffic throughout. (4) Road from Shillong, *via* Jowái and Mukhtápur, to Jaintápur in Sylhet; length, about 70 miles. This road is being improved from year to year, and when finished the cost may amount to £50 per mile. (5) Road to connect Shillong with the Garo Hills, opened out from Márbisú, *via* Sob-iong, Kynchi, Máo-ker-chá, and Nongstoin, to within 10 miles of the boundary between the two Districts; length, about 52 miles. This road is at present only a fair-weather road. It was made in 1872-73, and when completed may cost £50 a mile. (6) Road to connect Shillong with the Confederate State of Sheilá, bordering on Sylhet, from Lyn-kyn-tyng-noh *via* Pom-ran-ngát to Sym-pher; length, about 16 miles. This road, when completed, will be about 60 miles in length. (7) Road leading *via* Lait-tyng-kat to Sob-rá-rim and Cherrá Pínji; length, about 22 miles. This is at present a bridle path, but may eventually be the line for a cart road to Cherrá Pínji. (8) Road from Jowái, in the Jaintiá Hills, to Nong-ritiong; length, about 12 miles. This road, when extended, will connect Jowái with the District of Nowgong in the Brahmaputra valley, and the estimated total length will be about 90 miles. Besides the above-mentioned eight roads, there are other bridle paths which facilitate access to remote places.

• 135 COAL MINES.—Coal exists in the Khási and Jaintiá Hills in connection with the limestone formation. As a rule the carboniferous strata are not extensive, and they are for the most part found in localities more or less inaccessible. In the Khási Hills coal has been discovered at the eleven following places:—(1) By-rang, altitude about 1242 feet above sea level; (2) Cherrá, 4118 feet; (3) Lait-tyng-iew, 4800 feet; (4) Máo-long, 600 feet; (5) Máo-noh, 1500 feet; (6) Máo-syn-ram, 4000 feet; (7) Máo-dun, 400 feet; (8) Máo-nai-chhord, 300 feet; (9) Máo-beh-lyrkár, 5000 feet; (10) Sheilá, 800 feet; (11) Thinjindih, 4400 feet. In the Jaintiá Hills at the five following localities:—(1) Am-wi, altitude about 3800 feet above sea level; (2) Lá-kú-dong, 2000 feet; (3) Náo-pá, 300 feet; (4) Sob-tyng-gih, 3500 feet; (5) Sher-mung, 4000 feet. The most extensive of the coal beds are those situated at Cherrá Pínji in the Khási Hills, and at Lá-kú-dong in the Jaintiá Hills.

20: Hunter G-4 (no date) 1897 AR 7 Khasi AR 7

The coal strata at the former place are calculated to extend over one-third of a square mile, with an average thickness of from 3 feet 6 inches to 4 feet; and the yield of the coal, if it could be worked, is estimated at 447,000 tons. At the latter spot the area of the coal-fields is computed to extend over 0·394 of a square mile, and the estimated yield of the mineral is about 1,100,000 tons. The coal at Cherrá Púnji and at Lá-kká-dong is in quality equal to some English coals; it is quick in its action, and consequently would generate steam rapidly; it cakes well, but gives out a large amount of smoke; it is fragile and easily broken. From the absence of that definite structure which produces the planes of division known to English miners as 'backs,' or joints in the coal, it breaks into unsymmetrical pieces, and consequently does not stow well. From its composition, quick combustion, and irregular cleavage, it is estimated to be from 5 to 7 per cent. inferior to good English coal; but as a gas-producing coal it is considered superior to English produce, both as regards quality and purity of the gas. It is also calculated to yield a good quality of coke. The market value of coal found in the Khási and Jáintiá Hills cannot be given with any approach to accuracy, owing to the expense of labour in the Hills and of carriage to the plains. The Station of Shillong, which consumes coal as fuel, derives its supply from the coal beds at Mawlongkhi, 18 miles distant, and the price is as high as £3 per ton. Lá-kká-dong is within six miles of Borghát, a village on an affluent of the Surmá, which is accessible all the year round by boats of 300 maunds, or 18 tons burden; but at present only coolie-carriage is available between Lá-kká-dong and Borghát.

The following is a brief history of the mines at Cherrá Púnji in the Khási Hills, and at Lá-kká-dong in the Jáintiá Hills:—Government holds a perpetual lease of the Cherrá Púnji mines from the chief or Siem of Cherrá, conditionally upon the payment by Government of a royalty of two shillings and eightpence for every five tons of coal quarried and removed from the mine, and also upon the terms that the people of Cherrá shall be permitted to work the beds on their own account. In 1862 Government transferred its right to work the mine to Captain Engledue, then agent of the Peninsular and Oriental Company, for a period of twenty years; but in the following year this gentleman, with the permission of Government, made over his lease to Messrs. Gisborne & Co., of Calcutta, who worked the mine for about two years,

1:Gurdon E-4.5 (no date) 1907 AR7 Khasi AR7

226 the streams. Khasis, except the Wárs and the people of Shella, unlike the Assamese and Bengalis, do not fish with nets, nor do they use the bamboo-work device known by the Assamese as *pale* (পলি) and *jak* (জাক). The method of fish-poisoning of the Khasis is the same as that described by Soppitt in his account of the tribes inhabiting North Cachar. The following is a description of how Khasis poison fish in the western portion of the district; it may be taken as a sample of the whole. A [204] large quantity of the bark of the tree *la nyuto* and the creeper *u khariew* is first brought to the river-side to a place on the stream a little above the pool which it is proposed to poison, where it is thoroughly beaten with sticks till the juice exudes and flows into the water, the juice being of a milky white colour. In a few minutes the fish begin to rise and splash about, and, becoming stupefied, allow themselves to be caught in the shallows. If the beating of the bark has been well carried out, many of the fish soon die and after a time float on the surface of the water. A large number of Khasis stand on the banks around with bamboo scoops shaped like small landing nets, to catch the fish, and fish traps (*ki khoraw*) Assamese *khoki* (খোকি) are laid between the stones in the rapids to secure any fish that may escape the fishing party. Another fish poison [204] is the leaves *u sah lim*, the juice of which is beaten out in the same manner as described above.

226 Soppitt says, certain fish do not appear to be susceptible to 136 the poison, and not nearly the destruction takes place that is popularly supposed. The mahseer and the carp family generally do not suffer much, whereas, on the other hand, the river shark, the *hangsa* *mas* of the Bengalis, is killed in large numbers. It is [illegible], however, [illegible] of the [illegible], which the mahseer fry, which abound in these hill rivers in the spring and early summer months, can escape being destroyed in great numbers when the streams are frequently poisoned. In the neighbourhood of lime quarries and other large works where dynamite is used for blasting, this explosive is sometimes 226 employed for killing fish. The practice, however, has been strictly prohibited, and there have been some cases in which the offenders have been punished in the courts. Fish-poisoning is bad enough, but dynamiting is still worse, as with an effective

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

wonderful mass of granite known by the name of the Kyllang Rock will be found in the section of the monograph which deals with geographical distribution. I have also added a photograph of the rock. The Syntengs have a story that when the strong west wind blows in the spring this is due to the advent of *U Kyllang*, who comes to visit his wife, the river *U'mngot*, at that season: amongst the Khasis hills are all of them masculine, but to rivers is usually attributed the feminine gender. U Symper is another isolated rocky eminence rising from the Maharam plain close to the village of K'mawan. The best view of the hill is obtainable from Laitmawsiang on the path to Mawsynram. The village of Mawmai every traveller from Therria to Cherrapunji knows. It is chiefly remarkable for a fairly large limestone cave, and its fine memorial stones. The Khasi theory to explain how the moon got its spots is, I believe, original, but is no more extraordinary than our own nursery tale about the "man in the moon." The *Sohpet Byung* hill is the first hill of any size that the traveller sees on the Gauhati road when journeying to Shillong. It is close to U'msning Dak Bungalow. There are caves in the hill which are tenanted by bears. Strange to say, according to Khasi ideas, this is one of the highest points in the hills; in reality *Sophet Byung* is some 2,000 ft. lower than the Shillong Peak. As mentioned elsewhere, the Khasis are very fond of dogs; so I have given their version of how the dog came to live with man. The well-known *Ishiw* superstition will be found fully described under the heading of "Human sacrifices." I have, however, thought the tale of sufficient interest to reproduce at length here. The story of the river Rapatylli is a pretty tale, and is just such a one as would appeal to the imagination of mountaineers like the Khasis. The Kopili story is important, in that it indicates the origin of human sacrifices in the Jaintia Hills; it also throws, perhaps, some light on the question of the use to which the flat table memorial stones were put in years gone by. The superstition about the crossing of the Kopili can be vouched for by many who have taken the journey from the Jaintia Hills to North Cachar by the Kopili route. Mawpunkyrtiang is a small village close to Cherrapunji. The weird tale about the Siem of Malyniang is the pride of the Maskut people, for in olden days their King,

527

won the money in the archery contest and now we should have a big feast. It is full moon now and much more beautiful during the night than the day. Oh, we are just having a good time." At once he swung his bunches of leaves and hopped away. The women take care of stirring the cooking pots. They are not choosy about the spoon. A bamboo, which a tired dancer might have just thrown away, is quite adequate for this purpose. When everything is ready, the people sit down in groups and eat the meat. Rice brandy is handed around. When the archers and other guests at the festival are more than sated and exhausted from all the dancing, they leave the place towards morning.

It should be pointed out that contrary to their usual customs the Khasi eat no rice at the great feast after the archery competition but only meat, with which brandy is drunk. There is a good deal of overindulgence in food and drink on this occasion. (32) [262]

32. P.F. Stegmiller, "Das Fest nach dem Pfeilschiessen" [The Feast after the Archery Contest], Salvatorianische Mitteilungen [Salvatorian Communications], 1910, No. 3.

4. Hunting Customs

224
134

Although there are all sorts of wild animals in the Khasi hills and Jaintia hills that can be hunted -- flying foxes which visit the orange gardens during the night, jackals, which annoy the villages with their howling, antelopes, does, deer and wild pigs which damage the rice fields, wild dogs, wolves,

224 bears, leopards and tigers, which seize their
•136 prey not merely among the goats and calves, but also among the grown cattle, and at times are even dangerous to man; although there are lots of tasty birds -- quails, partridges, lapwings, coots and wild geese -- in spite of all this the Khasi are not actually hunters. Only when an opportunity either presents itself to catch such birds, or when a wild animal has shown itself or even caused damage in the village, then the Khasi go hunting. Exceptions occur. The Khasi who use bows and arrows from childhood on, who practise shooting conscientiously, dare to hunt bears, leopards, and tigers. [621] Today they often have guns for this purpose, but bown and arrows are always taken along.

224 When a lucky day has been determined upon
187 by egg throwing, (33) and often the hunting area

33. Dr. P.C. Becker, "Das Eierwerfen der Khasi" [Egg Throwing Among the Khasi], Anthropos, 1917-1918, pp. 494 ff.

is often determined in this way, the Khasi set
224 out with a pack of hounds. As soon as the dogs have come upon the scent of the wild animal, the Khasi begin driving it with howlings and noise. The first shooter is lucky (called u nongsiat by the Khasi) because he gets the lion's share of the prey. Whoever is the second one to hit the animal (called u nongban by the Khasi) also receives special consideration. The other shooters divide the rest of the slain animal among themselves after the hunting dogs have each been given a piece. The Khasi are very persevering on the hunt and do not bother about the time or the distance. For the efforts expended on the hunt are richly rewarded by the

0.5—In the following paragraphs we have reproduced the yield rates of different crops, calculated on the basis of area harvested and total produce reported by the cultivators. For assessment of correct yield rates it is necessary to conduct a scientifically designed crop cutting survey which in view of its largeness in magnitude and other complexities associated with the type of experiments, could not be dealt in with the programme of the present survey. It is admitted that the yield estimates worked out by us are proved to be subjected to the usual limitations of this type of data.

Yield

1. **Paddy.**—It will be seen from table above that average yields of paddy per acre for Border area, General area and Project area are respectively 8.38 maunds, 12.97 maunds and 13.69 maunds and for the district as a whole it comes to 11.86 maunds though there are cases where maximum yield goes to above 18 maunds per acre. Thus it is seen that the average yield is much less than the average yield for the State of Assam (plain district) which is above 20 maunds per acre. Average yield in Border area is suddenly much smaller. Apart from low fertility of land, another reason for this low average is that in a number of villages selected from Border area such as Syndai, Aathi and Lumdoong, there was widespread havoc to standing crops was caused by wild elephants.

2. **Potato.**—The average for the three areas comes to 21.61 maunds per acre which is in contrast to the State average of above 40 maunds per acre. Our estimate has in fact been lowered due to inclusion of a few villages in the foot hills where potatoes don't grow well, otherwise in a number of high altitude villages, yield per acre well exceeded 40 maunds. The average for Border area is rather too low. Apart from unsuitability of Border land of high altitude potatoes another reason for this low average is that during the reference year the crop suffered from widespread incidence of pests and insects.

3. **Orange.**—Yield of orange in Border area, Project area and General area was found to be 3.87 lakhs or 5906 numbers against 16.74 lakhs or 17162 numbers and 2.80 lakhs or 2867 numbers respectively. Thus the average yield in Border area, even considering the school nature of some gardens is much low. The reasons are obvious.

4. **Betelnut.**—Average yield per acre from Border area, Project area and General area was found to be 2.89 lakhs (18722 numbers), 4.11 lakhs (26304 numbers) and 3.42 lakhs (19882 numbers) respectively bringing the average for all the three areas to 2.95 lakhs per acre.

5. **Betel leaf.**—Average yield per acre works out at 17.25 lakhs, 50.64 lakhs and 24 lakhs in Border area, Project area and General area respectively. Thus in Border area the average is much lower. This is due to the fact that most of the gardens remained unplucked for want of market for leaf.

[illegible] ACCOUNT OF KHASI AND JAINTIA HILLS.

in Darjiling, who reported unfavourably on them. They have since been made over to the State of Bengalia, who is responsible for their being kept clear of weeds and protected against fire. Up to the close of 1879-80 the total expenditure had been Rs. [illegible], or £[illegible], 4s. 6d.

FOREST REVENUE.—Tigers, elephants, rhinoceros, buffaloes, antlered or wild cows, bears, leopards, wolves, jackals, foxes, wild dog, and several kinds of deer abound in the Khasi and Jaintia Hills. The rewards of keeping down tigers in the shape of Government rewards amounted to £[illegible] one ad. in 1879-80. The rate of reward now paid is Rs. 25 or £[illegible] one ad. per head. No rewards have ever been given for the destruction of venomous serpents. The number of deaths from wild beasts and snakes reported to the police amounted to 18 in 1876-77, 18 in 1877-78, 18 in 1878-79, and 18 in 1879-80. The small game found in the Hills consists of black partridges, hill partridges, quails, ducks, teal, snipe, and woodcocks. The *mahsir* fish is caught in the rivers. No regular tools is carried on in the skins of wild animals; and, except in the case of wild elephants, the *fees* actually are not made to contribute towards the wealth of the people.

ELEPHANTS.—Wild elephants are found in the lower ranges of the hills, and in the jungles opening on the valleys of the Barak and the Brahmaputra. Each Sub- in the Khasi Hills and each Subdivision in the Jaintia Hills constitutes a separate hunting circle or market. In the Khasi Hills the conditions of elephant hunting are governed by rules framed in 1879-80 by the Chief Commissioner, and approved by the Government of India. These rules provide, (1) that the British Government will make no claim to royalty on account of elephants caught in the Khasi Hills; (2) that one half of the proceeds of the sale of each elephant caught shall be paid over to the chief whose State forms the market, and the other half retained by Government; (3) that if a chief wishes to hunt elephants on his own account, the relief conferred of his force shall be exempt from sale, and a special arrangement shall be made with him on the basis that half the proceeds of the hunting shall accrue to Government. A special form of hunting licence in accordance with these rules has been issued by the Chief Commissioner. In the Jaintia Hills, as being British territory, the ordinary forest rules are in force, in accordance with which licence of the market are sold at intervals of two years to the highest bidder at

crops of waste land, some is cultivated in a manner resembling the *jum* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a fixed tenure. Any vacant of land is recognised, and there are no recognised rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for vacant land would be from two to three shillings a year for an acre land so an individual can cultivate with his own hands. 423 [427]

Manure is generally used in mixing rice and potatoes. It is 243
seldom purchased, the dung and litter of the cattle and other 244
animals about the house being generally utilized for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of one ton, is required per acre. Manure, if purchased, would cost from six rupees to six rupees per acre for rice land, and for potato fields from one to six per acre. [435]

Irrigation for agricultural purposes is regularly practised. 312
Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills.

Model Farm.—The Shillong Model Farm, established in 1871, 177
has not proved a success. Experiments tried with wheat give 244
some hope that cold-weather crops may profitably be introduced 447
into the Hills. Two new varieties of potato—"red maple" and 654
"pheasant's eye"—were successfully introduced in 1872-73; but these are not looked upon favourably by the Khasis, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, 177
pear, cherry, nectarine, and plum; and the tables of the European 245
residents are supplied with vegetables from the garden attached 447
to the farm. *A Manual of Plants Cultivation* compiled by 654
the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed [336]
partly to the coldness of the soil, and still more to the ravages of [336]
white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally 231
unfortunate. During the two years 1872-73 the sum of Rs. 1,700 443
654

Garo Hills	117	162
Manipur	69	101
Total	4,091*	

The following information regarding the general aspect of the Khasi and Jaintia Hills district, with some additions, is derived from Sir William Hunter's Statistical Account of Assam. The district consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is very steep until a table-land is met with at an elevation of about 4,000 feet at Cherrapunji. Higher up there is another plateau at Mawphlang. This is the highest portion of the hills, some villages being found at as high an elevation as close on 6,000 feet above sea level. Fifteen miles to the east of Mawphlang, and in the same range, is situated the civil station of Shillong, at an average elevation of about 4,900 feet. The elevation of the Shillong Peak, the highest hill in the district, is 6,450 feet above sea level. On the northern side of the hills are two plateaux, one between 1,000 and 2,000 feet below the level of Shillong, and another at an elevation of about 2,000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where the hills have been denuded of forest, the country is covered with short grass, which becomes longer and more rank in the lower elevations. This denudation of forest has been largely due to the wood being used by the Khasis for fuel for iron smelting in days gone by. The Government, however, has taken steps to protect the remaining forests from further spoliation. A remarkable feature is the presence of numerous sacred groves situated generally just below the brows of the hills. In these woods are to be found principally oak and rhododendron trees. The fir-tree (Pinus Khasia) is first met with on the road from Gauhati to Shillong, at Umsning, at an elevation of about 2,500 feet. In the neighbourhood of Shillong the fir grows profusely, but the finest fir-trees are to be seen

* The figures for Khasi population in the Khasi and Jaintia Hills district will be found under "Shillong."

1:Gordon E-4, 5 (no date) 1907 AR? Khasi AR?

137 in the Jowai sub-division. In the vicinity of Nongpoh is observed the beautiful *sakar* or *sapowar*, the iron-wood tree. The latter is also to be found on the southern slopes of the hills in the Jowai sub-division. There are some *sal* forests to the west and south of Nongpoh, where the *sal* trees are almost as large as those to be found in the Garo Hills. Between Shillong and Jowai there are forests of oak, the country being beautifully wooded. Chestnuts and birches are also fairly common. The low hills on the northern and western sides of the district are clad with dense forests of bamboo, of which there are many varieties. The Tambarra or *arrow-pine* is to
138 be met with on the southern slopes. Regarding the geological
133 formation of the hills, I extract a few general remarks from the Physical and Political Geography of Assam. The Shillong plateau consists of a great mass of gneiss, lying on the northern border, where it is broken into hills, for the most part low and very irregular in outline, with numerous outliers in the Lower Assam Valley, even close up to the Himalayas. In the central region the gneiss is covered by transition or sub-metamorphic rocks, consisting of a strong band of quartzite overlying a mass of earthy schists. In the very centre of the range, where the hills land attains its highest elevation, great masses of syenite-diorite and granite occur; and the latter is found in dikes piercing the gneiss and sub-metamorphic series throughout the southern half of the boundary of the plain. To the south, in contact with the gneiss and sub-metamorphics is a great volcanic outlierlet of trap, which is stratified, and is brought to the surface with the general rise of elevation along the face of the hills between Shella and Thongkhat south of Cherrapunji. This has been described as the "Sylhet trap." South of the main axis of this metamorphic and volcanic mass are to be found strata of two well defined series; (1) the cretaceous, and (2) nummulitic. The cretaceous contains several important coalfields. The nummulitic series, which overlies the cretaceous, attains a thickness of 300 feet in the Therria river, consisting of alternating strata of compact limestones and sandstones. It is at the exposure of these rocks on their downward dip to the edge of the plateau that are situated the extensive limestone quarries of the Khasi Hills. There are numerous

I: Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

limestone caves and underground water-courses on the southern face of the hills. This series contains coal-beds, e.g. the Cherrapunji and that at Lakadong in the Jaintia Hills. Some description of the remarkable Kyllang Rock may not be out of place. Sir Joseph Hooker describes it as a dome of red granite, 3,600 feet above sea level, accessible from the north and east, but almost perpendicular to the southward where the slope is 80° for 600 feet. The elevation is said by Hooker to be 400 feet above the mean level of the surrounding ridges and 700 feet above the bottom of the valleys. The south or steepest side is encumbered with enormous detached blocks, while the north is clothed with forests containing red tree-rhododendrons and oaks. Hooker says that on its skirts grows a "white bushy rhododendron" which he found nowhere else. There is, however, a specimen of it now in the Shillong Lake garden. Numerous orchids are to be found in the Kyllang wood, notably a beautiful white one, called by the Khasis *ulior kyllang synrai*, which blooms in the autumn. The view from the top of the rock is very extensive, especially towards the north, where a magnificent panorama of the Himalayas is obtained in the autumn. The most remarkable phenomenon of any kind in the country is undoubtedly the enormous quantity of rain which falls at Cherrapunji.* Practically the whole of the rainfall occurs in the rains, i.e. from May to October. The remainder of the district is less rainy. The climate of the central plateau of the Shillong range is very salubrious, but the low hills in parts of the district are unhealthy. The effect of the different climates can at once be seen by examining the physique of the inhabitants. The Khasis who live in the high central plateaus are exceptionally healthy and strong, but those who live in the unhealthy "Blue country" to the north, and in the Lyngngam portion to the west of the district, are often stunted and sickly. Not so, however, the Wars who live on the southern slopes, for although their country is very hot at certain times of the year, it does not appear to be abnormally unhealthy except in certain

* The average rainfall at the Cherrapunji Police Station during the last twenty years, from figures obtained from the office of the Director of Land Records and Agriculture, has been 425 inches. The greatest rainfall registered in any one year during the period was in 1906, when it amounted to 721 inches.

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

extracted by squeezing the comb with the hand. Wax is obtained by placing the comb in boiling water and allowing it to cool, when the wax floats to the surface. The Khasis do not systematically tend their bees, as they do not understand how to prevent swarming, and as the Khasi bee is a prolific swarmer, hives become weak very soon and a new hive has to be started from a captured natural swarm. The villages in which bees are regularly kept to any large extent in the Khasi and Jaintia Hills are Thied-dieng, Mawphoo, Nongwar, Mawlotg, Fynnor, Tyrna, and Kongthong, but most of the *Wáir* villagers rear bees and sell the honey at the neighbouring markets. The collection of the honey of the wild bee, or *u Ipwai*, is a hazardous occupation, the services of some six or seven persons being required, as the combs of this bee are generally built in the crevices of precipitous rocks, and sometimes weigh more than half a maund each. When such hives are discovered the bees are driven out by the smoke of a smouldering fire lit at the foot of the rock below the hive. Two or three men get to the top of the precipice, leaving two or three of their companions at the base. One of the men on the top of the rock is then lowered down in a sling tied to a strong rope, which is made fast by his companions above to a tree or boulder. The man in the sling is supplied with material to light a torch which gives out a thick smoke, with the aid of which the bees are expelled. The man then cuts out the comb, which he places in a leather bucket or bag, which, when filled, he lowers down to the persons in waiting at the foot of the rock. The wild honey may be distinguished from that of the domestic bee by being of a reddish colour. Honey from the last-mentioned bee is gathered twice or thrice in the year, once in the autumn and once or twice in the spring; that gathered in early spring is not so matured as that collected in autumn. The flora of the Khasi Hills being so numerous, there is no necessity for providing bees with artificial food. The bees are generally able to obtain their sustenance from clover, ammonias, "golden rod," bush honeysuckle, and numerous shrubs such as rudbeckia, daphne, &c., which abound about Shillong. There seem to be facilities for apiculture on a large scale in these hills, and certainly the honey which is brought round by the Khasis for sale is

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

work is done. In order to ascend to a Bhoi house, you have to climb up a notched pole. The Bhois sacrifice a he-goat and a fowl to *Rik-lapliang* (Khasi, *Riewlew ling*), the household god, when they build a new house.

VILLAGES.

Unlike the Naga and Kukis, the Khasis do not build their villages on the extreme summits of hills, but a little below the tops, generally in small depressions, in order to obtain some protection from the strong winds and storms which prevail in these hills at certain times of the year. According to the late U' *Sordon* Roy, it is *eang*, or taboo, to the Khasis to build a house on the last eminence of a range of hills, this custom having perhaps arisen owing to the necessity of locating villages with reference to their defence against an enemy. Khasis build their houses fairly close together, but not as close as houses in the Bhoi and Lyngngam villages. Khasis seldom change the sites of their villages, to which they are very much attached, where, as a rule, the family tombs are standing and the *mawbynna* or memorial stones. In many villages stone cromlechs and memorial stones are to be seen which from their appearance show that the villages have been there for many generations. During the *Jaintia* rebellion the village of *Sowai* was almost entirely destroyed, but as soon as the rebellion was over the people returned to the old site and rebuilt their village. Similarly, after the earthquake, the ancient village sites were not abandoned in many cases, but the people rebuilt their houses in their former positions, although in Shillong and Cherrapunji they rebuilt the walls of the houses of wooden materials instead of stone. There is no such thing as a specially reserved area in the village for the Siem and the nobility, all the people, rich or poor, living together in one village, their houses being scattered about indiscriminately. To the democratic Khasi the idea of the Siem living apart from his people would be repugnant. In the vicinity of the Khasi villages, often just below the brow of the hill on the leeward side, are to be seen dark woods of oak

9:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

and other trees. These are the sacred groves. Here the villagers worship *U ryngkew U baas*, the tutelary deity of the village. These groves are taboo, and it is an offence to cut trees therein for any purpose other than for performing funeral obsequies. The groves are generally not more than a few hundred yards away from the villages. The villages of the Syntengs are similar in character to those of the Khasis. The War villages nestle on the hill-sides of the southern border, and are to be seen peeping out from the green foliage with which the southern slopes are clad. In the vicinity of, and actually up to the houses, in the War villages, are to be observed large groves of areca-nut, often twined with the *pan* creeper, and of plantain trees, which much enhance the beauty of the scene. Looking at a War village from a distance, a darker shade of green is seen; this denotes the limits of the extensive groves where the justly celebrated Khasi orange is grown, which is the source of so much profit to these people. The houses in the War villages are generally closer together than those of the Khasis, probably owing to space being limited, and to the villages being located on the slopes of hills. Generally up the narrow village street, and from house to house, there are rough steep stone steps, the upper portion of a village being frequently situated at as high an elevation as 200 to 300 ft. above the lower. In a convenient spot in a War village a clear space is to be seen neatly swept and kept free from weeds, and surrounded with a stone wall, where the village tribunals sit, and the elders meet in solemn conclave. Dances also are held here on festive occasions. At Nongpi village there is a fine rubber tree, under whose hollow trunk there are certain sacred stones where the priest performs the village ceremonies.

The Bhoi and Lyngam villages are built in small clearings in the forest, the houses are close together and are built often in parallel lines, a fairly broad space being reserved between the lines of houses to serve as a street. One misses the pretty gardens of the War villages, for Bhois and Lyngams attempt nothing of the sort, probably because, unlike the Khasi, a Bhoi or Lyngam village never remains more than two or three years in one spot; generally the villages of these people are in the vicinity of the forest clearings, sometimes actually in the midst

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

mould. The plant is watered by means of small bamboo aqueducts which are constructed along the hill-sides, the water being conducted along them often considerable distances. As in the plains, the leaves of the *pân* creeper are collected throughout the year.

The bay leaf (*la tryphôl*, or *tezpât*) is classified in the *Agricultural Bulletin* as *Cinnamomum tamala*, and there is a note in the column of remarks that "this tree, as well as one or two others of the same genus, yields two distinct products, *tezpât* (bay leaf) and cinnamon bark." The bay leaf is gathered for export from the extensive gardens in Maharam, Malaichaut, Mawsynram, and other Khasi States. The plants are raised from seed, although there are no regular nurseries, the young seedlings being transplanted from the jungle, where they have germinated, to regular gardens. Bay leaf gardens are cleared of jungle and weeds periodically; otherwise no care is taken of them. The leaf-gathering season is from November to March. The leaves are allowed to dry for a day or two in the sun, and then packed in large baskets for export. The gathering of bay leaf begins when the trees are about four years old.

The following are the other minor crops which are grown in the Khasi and Jaintia Hills:—

Pineapples, turmeric, ginger, pumpkins and gourds, the egg plant, chillies, sesamum, and a little sugar-cane. The arum* (*la Alirie*) is also extensively grown in the hills, and forms one of the principal articles of food amongst the poorer classes; it is generally raised in rotation with potatoes, or is planted along with *Job's tears*. The stem of the arum is sometimes used as a vegetable, also for feeding pigs.

In the *Jowai* Sub-Division, notably at Nartiang, there are fairly *gôd* mangoes, which are more free from worms than those grown in the plains of Assam.

The Bhoia and Lyngngam cultivate lac. They plant either *Jal*, a *landon*, in their fields, and rear the lac insect on this plant. Last year the price of lac at Garhati and Palmlaiet markets rose as high as Rs. 30 per maund of 82 lbs., it is said, but the price at the outlying markets of Singra and Boko was

* Colocasia esculenta, Schott. Kindu.

2 [i.e., the pân ... Ans. 1, 2]

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

the War country, it will be necessary to describe the land tenures and laws regarding land of each of these divisions separately. As land is always jhumed by the Bhois and Lyngams from year to year, customs regarding land with these people are naturally very simple. Taking land in the high plateau of the Khasi Hills first:—The lands are classified under two main divisions, (a) public and (b) private lands. The following are the different descriptions of lands in the first division:—

Ka ri Raj, or ka ri Siem, which are Siem's, or Crown lands. These lands are intended for the support of the Siem family, they cannot be alienated. The Siems are, however, precluded by custom from levying a land tax on persons who cultivate such lands, the relation of landlord and tenant between the latter and their chiefs being unknown.

Ka ri Lynghdoh.—These lands are for the support of the Lynghdoh or priests of the State. In some Siemships, as in Mawiang Siemship, paddy is grown on these lands from which rice is obtained for the State pujas.

Ki shnong, or village lands.—These lands are set apart to provide a supply of firewood, thatching grass, &c., and are the property of the village. The inhabitants of other villages are not allowed to enjoy the produce of such lands. Such lands can be cultivated by ryots of the village, but the latter possess only occupancy rights, and cannot transfer them.

Ki lawkynteng.—These are sacred groves, situated generally near the summit of hills, composed of oak and rhododendron trees, which are held sacred (*kynteng*), it being an offence, or sin, for any one to cut timber in the grove, except for cremation purposes. These groves are the property of the village.

(b) Private Lands. These may be subdivided into *ri-kur*, or lands which are the property of the clan, and *ri kynthi*, family, or acquired landed property. In the Khasi Hills proper a very large proportion, certainly of the high lands, is the property of the clan; for instance, the high lands at Laitkor, which are the property of the Khar kmaw and Kur kalong clans, whose ancestors the large memorial stones close to the Laitkor road commemorate, also the lands of the Thang Khew clan, and many others.

'0:Clarke U-3 (no date)1874 AR7 Khasi AR7

133 patches of open forest, and with scattered fir trees and oaks. Though south of the Himalaya range the character of the
137 country is more like that found in the Himalayas at 4,000 feet higher elevation, and many plants, never collected in the Himalayas below 9,000 feet above sea-level, are found in the Khasi Hills between 4,500—6,000 feet. In this marvellous plateau the sub-alpine and the sub-tropical forms overlap; at the very foot of elegant palms may be gathered the identical stag's horn moss, which, in Britain, is found only on mountains. On a fir tree much resembling a scraggy Scotch-fir is seen growing the Vanda coerulea, the king of epiphytic orchids; a gnarled oak will carry a gigantic tropical lilase; the painted lady and many other British species of lepidoptera will be accompanied by gorgeous tropical papilios and by window moths eleven inches across the wing; the cuckoo and Himalayan pheasant are above, while the tiger, the wild elephant and the green python are below. Justly has Dr. Hooker observed, "I know no spot in the world more calculated to fascinate the naturalist who, while appreciating the elements of which a landscape is compound, is also keenly alive to the beauty and grandeur of tropical scenery."

211 2. Almost throughout Khasi-land, and in a less degree through the Jaintea country, monumental stones are common. They are numerous in villages in the valleys, but are specially prominent, and sometimes of gigantic size, scattered over the rounded hill-tops where they form a feature in the landscape. In all modern treatises of Archæology and Anthropology the study of monumental stones forms an important chapter. Monuments of a remarkable similarity in design are found alike in Europe, Asia, and isolated islands in the Pacific Ocean, and these are in general of such extreme antiquity that they are treated as belonging to the prehistoric age. The Khasi stone monuments have attracted already much attention; first, because of their great number and size; and, secondly and chiefly, because on these hills the erection of these monuments is now in full practice. It is reasonably supposed that a careful study of the Khasi method of raising the stones, and of the traditions or customs in accordance with which they raise them, may throw some light upon more ancient monuments of the same kind, even upon Stonehenge. It has been proposed to send out a commission from England to survey these Khasi stone monuments. They are described by Dr. Hooker, in his work (Him. Journ. II. 278), also by Colonel Fisher in the *Calcutta Review*, and some account has been lately given by Major Godwin-Austen in the "Journal of the Anthropological Institute," No. 2, Oct. 1871.[1] The present memoir was written

[1] [illegible] has been prepared for the site. —Ed.]

19: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

CHAPTER I

INTRODUCTION

The homeland of the Khasi is the hilly country situated in the northeast of India and known at present as the District of United Khasi and Jaintia Hills, under the Assam State Government. The area is bounded by the plains of the Kamrup and the Nowgong Districts to the north, by the Cachar Hills and East Pakistan (District of Sylhet) to the south, and by the United Mikir and North Cachar Hills Districts to the east. The Khasi and Jaintia Hills are divided politically into two subdivisions, with headquarters at Shillong for the Khasi Hills, and at Jowai for the Jaintia Hills, respectively. The peoples of both subdivisions are called "Khasi" in a broad sense, and are distinctly marked off from other neighbouring tribes and peoples by language and social structure. The population of the Khasi in the District is 363,505 (*Census of India, 1951, Assam*). Their language belongs to one of the Mon group of the Austro-Asiatic family to which the Munda in central India also belongs.[1]

Though all Khasis share fundamentally the same language and social structure, their culture, dialects, economy, social usage, and political organization vary greatly, owing to the ecological and politico-historical differences among them. The United Khasi and Jaintia Hills are much higher than the neighbouring Garo Hills. The plateau of the Khasi Hills ranges from about 5,000 feet to 6,000 feet, of which

1. The *Census of India, 1951, Assam*, makes the following remarks on their language: "Three sources unknown have been discovered to be the Palaungs, a tribe inhabiting one of the Shan States to the northeast of Mandalay on the middle Salween. Later the relationship of the Khasi language has been traced not only to the Mon-Khmer language, but also to the Nicobarese and several dialects spoken by some tribes in the Malay Peninsula. In Assam, this special form of speech is only found in the Khasi and Jaintia while nearly all the other primitive languages with which it is surrounded belong to the great Bodo family. The Khasi language is the only member of the Mon-Khmer family which possesses a grammatical gender distinguishing all nouns as masculine and feminine, and here also the feminine noun immensely preponderates."

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

133 the highest point is the Shillong Peak, 6,445 feet, covered with scrub,
• 137 grassland and forests (mostly oak, rhododendron and pine trees). The Jaintia Hills are considerably lower, with much flat land; wet paddy cultivation is practised here and there where sufficient water is available. From the plateau of the Khasi Hills northwards to the Assam Brahmaputra Valley there is a gentle slope covered with thick jungle, and the southern slope towards the Bengal plain is very steep, so that

101
102
619

Map. 9. — *Map of the Khasi-Jaintia Hills with Classification of Groups.*

139 the upland remained practically cut off from the plains until the
137 middle of the 19th century.

Following the geographical and ecological differences, the five
619 groups are segregated into fairly well-defined cultural areas, each
[191] developing a different economy and dialect:
[24]

1. The Jaintia[1] — associated mostly with wet rice cultivation.
2. The Khun (upland Khasi) — practise potato cultivation with small-scale rice and maize cultivation.
3. The War — inhabit the southern slope of the Khasi and Jaintia Hills (they are called geographically the Khasi War and the Jaintia War). Due to the heavy rainfall, the soil is the most fertile in the Khasi and Jaintia Hills. The Khasi War practise jhuming of which the main yield is millet. In the lower part of this area, betel-leaf, betel-nut, and orange gardens are cultivated. The Jaintia War practise wet rice cultivation like most of the Jaintias, as well as betel-leaf cultivation.
4. They are called also the Syiemlieng or the Pnar.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

137 178 244 Besides these political and religious changes, there have been very important changes in Khasi economy, particularly by the spread of potato cultivation. Potatoes were first introduced into the Hills in 1830 by Mr. David Scott. Since then, the upland Khasi Hills have been completely planted with potatoes. This grassland seems to be very easily adapted to potato cultivation; it spread so rapidly and successfully, becoming basic economy of the people, that they hardly remember life without potatoes. Information is very scanty on what was the major cultivation before the potato. However, we may surmise that they must have practised jhum cultivation as do the present people in War and Bhoi. Nowadays, there are no jhum fields in the uplands as there are practically no forests with which to make jhum fields. There must have been a long period of jhum cultivation, which resulted in recent ecological changes in the uplands through the exploitation of the jungle. This hypothesis might be supported by the existence of big timbers in old buildings in the Khasi Hills, as well as by the present economic techniques of the people.

137 244 241 The present potato cultivation is also a kind of shifting cultivation like jhuming, with a rotation from three years to five years. The uplands are covered with grassland, and sometimes with scanty pine trees which were also introduced by the British. For potato cultivation, the Khasi first cut branches from these pine trees, and the grassland is cultivated by the small Khasi hoe. They root out grasses with earth attached about three inches in depth and one foot square. These pieces are turned unto the cultivated surface, where fallen leaves, branches and wild grass have been spread, in such a way as to keep a space between the ground and the turned up clods of earth. The field in which the potatoes are to be planted is entirely covered in this way. The grass and leaves are set on fire in one corner of the field and this fire spreads through the middle spaces and burns all of the grass and branches, thus converting it into excellent manure. The potatoes are planted afterwards. Two crops of potatoes are raised generally in a year. The following year the field is shifted to another grass-growing area, leaving for a few years the last field to grow another crop of grass. This is a type of small-scale jhum cultivation. 178 244 [241] This example of the present economic method suggests that the Khasi had been jhum cultivators before potatoes were introduced. It might be indicative of the last stage of jhum cultivation when the forests are completely exhausted. Before the potatoes, they must have grown yams, maize and millet more or less in the same manner; these items are still cultivated on a small scale along with potatoes; the yield must be very low as compared with that of the War areas, obtained through the exploitation of land. In the uplands, pan culti-

CHAPTER II

General features of the district

1.34 2.1 In this chapter a brief note on the geography, population and economy of the district is given in order to provide a perspective and make the report self contained.

1.35 2.2 **Relief**.—The whole of the district is composed of hill tracts. On the northern and western border these hills take the form of undulating ranges which run for the most part north and south and have a general height of 500 to three thousand feet. None of the hills in the central and southern portions of the district has anything rocky or precipitous about them. Their sides are covered with dense growth and from one direction or another, they are generally be approached by a gradual incline. There is a high plateau in the centre of the district, the general level of which is not much below 6000 feet though it decreases to height towards east and west.

2.3 **Rivers**.—The high plateau that occupies the centre of the district is the watershed of the hills. The following are the principal rivers. On the west there is the Jaintiaka or Kynshi river, further east come the Um Mawie and the Begli which fall into the Surma. The Umngot or Mahadduli, known as the Pine Gang in the plains of Nilhat, forms for a considerable distance the boundary of the Khasi and Jaintia Hills. On the north the principal rivers the Kaliyo, the Digaru and Umiam. Further west come the Umkiam, Um Mawang and the Myntang. All these rivers possess the characteristics usually associated with hill streams. The beds are rocky and gravelly, the currents swift and after heavy rains even small streams rush down in spate. The rivers of the district are not used for traffic to any appreciable extent.

1.36 2.4 **Minerals**.—The Geological products of economic value are lime and coal. From the earliest days of British rule, the lime quarries of Khasi Hills formed one of the principal attractions of Nilhat, drawing a large number of Europeans to that district. The lime quarries are situated at along the southern face of the hills. Coal is found both in the cretaceous and nummulitic formations. The largest deposits of nummulitic coal are found at Cherrapunjee, Laitryngew, Mawlong, Mawsi, Mawsynram, Mawlai, Thangjaith, Laitlang and Sarah. Cretaceous coal is found in Mawlaikhar, Sumer, Mawang Laitkynew and in the Langrin field.

1.37 2.5 **Forests**.—The district exhibits a varied flora reflecting the variations in the physical features, configuration of the ground, rainfall factors and climatic gradient. In the pine zone, covering area between 2000-4000' elevation are found the pines, birch, alders, oak, beech, etc. The evergreen hardwood zone, which forms belt along the foothills contains useful hardwood species of which the more important species are sal, sedar, chem, chap, gamar, etc. The dry grassy belt covering the lower slopes roughly between 500-2000' elevation form the best grazed for grasses.

ACCOUNT OF KHASI AND JAINTIA HILLS.

175 Khasis, have, ever since the measures of improvement which
698 followed, remained peaceable and contented.

133 GENERAL ASPECT OF THE DISTRICT.—The District consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is steep, until a table-land is met with at an elevation of about 4000 feet. Higher up there is another plateau at Nongpoh, ten miles to the eastward of which, and in the same mountain range, the Civil Station of Shillong is situated at an elevation of 4500 feet above sea level. On the northern side of the hills are two plateaus, one between 1000 and 2000 feet below the level of Shillong, and the second lower down, about 500 feet above sea level. In general features all these plateaus are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the
• 137 higher ranges, where the hills have been denuded of forest, the country is covered with short grass, which becomes longer and
[718] more rank in the lower elevations. A remarkable feature in the aspect of the country throughout the hills is the numerous sacred groves which superstition has preserved from time immemorial from the destructive hand of the woodcutter. These sacred groves contain beautiful timber-trees of various kinds, rare orchids, rhododendrons, and wild cinnamon. On the more elevated table-lands, pine trees and stunted oak are met with; and in the lower hills, in every direction, are dense forests of the usual Indian trees, containing valuable timber.

194 The geological formation is mainly granite, with stratified rocks
195 of sandstone, limestone, and shale. The coal-beds rest on trap and metamorphic rocks. The prevailing surface soil is a red ferruginous loam.

133 MOUNTAINS.—The principal mountain ranges and highest peaks in the Khasi and Jaintia Hills are as follows:—(i) The Shillong range—height of principal peak, 6445 feet above sea level. (ii) Dingiri range—principal peak, 4400 feet. (iii) Mawthadi-ri-shain range—highest peak, 4050 feet. (iv) Lite-rye-ri-ki range—highest peak, 3975 feet. (v) Lite-ri-ki-lok range—highest peak, 3900 feet. (vi) Lite-ker-ri—highest peak, 3400 feet. (vii) Lite-lok range—highest peak, 2980 feet. (viii) Long-ker-dem range—highest peak, 3000 feet. (ix) Lum-kiang range—highest peak, 4848 feet. (x) Mawsynram range—highest peak, 4800 feet.

The principal mountains are:—(i) Sag-lang—height, 4800 feet.

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

(8) Sohpetbyung, literally "The Navel of the Sky." This is supposed by the Khasis to be the centre of the world, and to be the highest peak in the hills. Its real altitude, however, is only about [illegible] feet. (9) Syrwe—height, [illegible] feet. (10) Shillong—height, [illegible] feet. (11) Diwiri—height, [illegible] feet. (12) Kylhong rock, one huge mass of stone, about [illegible] feet high, and of a rounded form—height above sea level, [illegible] feet. (13) Lite hills—height, [illegible] feet. (14) Lakadong—height, [illegible] feet. (15) Thangsniliè—height, [illegible] feet. (16) Nongpoh—height, [illegible] feet. (17) U Mèo—height, [illegible] feet. (18) Mawlong—height, [illegible] feet. (19) Mawkhrong—height, [illegible] feet. (20) Mawpynsai—height, [illegible] feet. (21) Symper—height, [illegible] feet. (22) Mawngi—height, [illegible] feet. (23) Lèimawkhe—height, [illegible] feet. (24) Nongsohsih—height, [illegible] feet. (25) Mawkyrwat—height, [illegible] feet. (26) Nongkhrong—height, [illegible] feet. (27) Kulihongngut—height, [illegible]. (28) Mawkhleh—height, [illegible] feet. (29) Pawrkylong—height, [illegible] feet.

The mountain peaks are of various forms and shapes, but generally conical, and capped by sacred groves. No roads exist to permit the ascent of carriages, but most of the hills can be ascended by bearers of burden, even without made tracks. In the eastern portion of the District the hills are covered with forest.

RIVERS.—Six navigable rivers flow through the hills, the streams being all mountain torrents. On some of the large streams, however, near the point where they debouch upon the plains, small canoes are used for short distances below the rapids. The principal streams flowing south to the Surma river in Sylhet are the following:—(1) The Kynshi-ang, named Jiddidi by the Bengalis in the plains; (2) the Tangla, called Mukdi in the plains; (3) the Bograh, called Bagdyng in the plains; (4) the Sakyngkew, called Dhulai in the plains; (5) the Mungli, called Pem in the plains; (6) the Mawryhda, called Hilé in the plains; and (7) the Lukai or Lulai. The principal tributaries to the Brahmaputra are:—(1) The Kapili; (2) the Umkhan, called Bangal in the plains; (3) the Umsiu; (4) the Umrem, called Digru in the plains; and (5) the Kaldon, called Kalé in the plains. All the foregoing streams have numerous feeders of their own, but none of them are of any importance.

The Khasi and Jaintia Hills are, like all mountainous countries, necessarily wooded, and the streams run over rocky beds, some passing through cultivated lands. As they approach the plains,

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

In former years the Khasias were great iron-smelters, and enormous excavations in the most favourable localities for obtaining ironstone prove the extent to which this manufacture was carried on. In some places the whole surface of the ground appears to have been dug up for a depth of several feet, leaving huge boulders standing up here and there. Of late years, however, as the price of labour in the Hills has risen, the trade in iron has died away, and there is now little demand for the Khásí article, the cheaper English metal having driven it out of the market.

178
316
325

NATURAL FEATURES.—Many peculiar caves and caverns are found in the limestone rock formation, the most notable being the cave at Chorá Pínji and at Bájyndih in Amwí. At the latter place the caverns extend a great distance beneath the earth, one being imagined by the people to reach as far as China, and a Hindu legend states that a Chinese army once marched by this route to the invasion of India. In another cave, the limestone stalactites have been carved into images representing the gods of the Hindu pantheon. On the banks of the Kapíl river on the Cáchár border, at a place called Sumír, there is a hot spring, the water of which contains carbonate of lime. All the rivers in the Hills flow through gorges in certain parts of their course, the most picturesque being at Tóbrá, where a small stream is compressed into deep pools among limestone rocks; and at Dumung and Jinghás, where the Mangú and Mantíríen rivers respectively debouch upon the plains.

133
[323]

FOREST, ETC.—The India-rubber or caoutchouc tree is found in many forests throughout the Hills, but not in great numbers, and the supply and value of the gum has much decreased of late years. In 1870 the right of tapping the trees in the Jíntiá Hills was leased out for a sum of £38, 10s. 0d.; but by 1878 the trade had almost entirely ceased. There are some tracts of timber forest on the lower hills towards the Brahmaputra valley, but through the want of water carriage they are of no great value. Vigorous efforts are being made to preserve the forests in the higher plateaux. Owing to the habit of firing the jungle in spring prior to sowing, great waste of valuable timber has taken place; but since the country has been separated from Bengal and placed under the administration of the Chief Commissioner of Assam, attention has been given to the matter, and special areas are now being set apart for the preservation and growth of forest timber. Cinnamon grows wild in some parts of the country. There is a considerable trade carried on in

137
[314]

137
648
659

000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

There is considerable trade carried on in
245 *nipit* or bay leaves, the trees being extensively cultivated by the
439 inhabitants of the lower slopes of the hills on the Sylhet border. The finest oranges in India are also grown in groves in the same tract, the value of the trade in which is now (1876) estimated to amount
237 to £3760 per annum. Lac is gathered by the Míkirs in the Jáintiá
439 Hills, but not to any great extent. Bees are both domesticated and found wild, and an extensive trade in bees-wax is carried on,
231 the amount exported being estimated at from three hundred to four hundred *maunds* annually. The whole of the Hills, where there is
233 no forest, and where the land is not under cultivation, consists of
621 rich pasture grounds, which are held in common by the villagers
651 and pay no revenue to Government.

137 The forests of the Khási and Jáintiá Hills do not yield much profit either to the British Government or to the chiefs. There
[648] are no reserved forests in the District; and according to the Deputy-
[659] Conservator, the total area of unreserved forest, *i.e.* of land covered with timber trees and not at present required for *júm* cultivation, is only 150 square miles. The trees found are chiefly pine, and those classified as 'mixed upper hill forests.' At an elevation of 3000 feet, the Pinus Kasia predominates over all other vegetation and forms almost pure pine forests. It is found also at lower heights, and there attains larger dimensions, but only in the case of isolated trees. The 'mixed upper hill forests' are confined to a series of sacred groves, which clothe the topmost ridge of the watershed between the valleys of the Brahmaputra and Surmá. The characteristic trees are those of a temperate vegetation, chiefly consisting of oaks, chestnuts, magnolia, Schima, Cinnamomum, Prunus, Engelhardtia, etc. There are also numerous other timber trees, including the valuable *sál* (Shorea robusta) and the rubber tree (Ficus elastica); but on the whole the Khási Hills are remarkable for the
[648] absence of forest. Early in 1874-75 measures were taken to put a
[659] stop to the indiscriminate burning of the forests, and the Siems and village officers were made responsible for the conservancy of the sacred groves. These endeavours have met with some success; but it is a very difficult thing to change the habits of a population, or to induce uncivilised tribes to incur a small temporary inconvenience for the sake of future benefit. The total area directly protected from fire during the year 1875-76 is returned at 3618 acres; the expenditure was Rs. 122; and in ten prosecutions for breaches of forest rules, twenty-three persons were convicted.

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

The forest administration of the British Government is confined to two plantations in the neighbourhood of Shillong, for which a rent is payable in perpetuity. One of these, on the further side of the Umkra, was originally acquired in 1871-72 for the sake of experiments in arboriculture. The rent of Rs. 50, or £5, is paid by the Forest Department; the area had been at first estimated at 380 acres, but an actual survey undertaken in 1875-76 reduced this estimate to 262·39 acres. A considerable portion is covered with Pinus Kasia, which is carefully protected. Of the exotic trees tried on this plantation, only the three following can be said to have done well: Juglans regia, Eucalyptus resinifera, and Pinus maritima. All the rest either suffered from frost in the winter, or required far more nursing than can be afforded them in forest plantations. The young trees of the indigenous oak (Quercus serrata) were also attacked by rats, who bit off great numbers just above the ground. The Spanish chestnuts did not thrive, and were removed to the model farm for trial at a higher elevation. The second plantation, on the northern slopes of the range immediately behind the Station, consists of several patches of forest, which were acquired in connection with the scheme for providing Shillong with a permanent water supply. The total rent is Rs. 375, or £37, 10s., paid from Town Improvement Funds; and the aggregate area is estimated at 796 acres. All the fields within this area that had formerly been cultivated by the Khásis—about 80 acres in all—were sown by the Forest Department with Pinus Kasia, Quercus Griffithii, Q. serrata, and Q. fenestrata, which have succeeded well; and about 8 acres were planted with different species of Eucalyptus. Up to the close of 1875-76 the sum expended on the first of these two plantations was Rs. 742. 9. 9, or £74. 5s. 3d., and on the second, Rs. 730. 9. 6, or £73. 1s. 2d.

A cinchona plantation was started in 1867 by the Superintendent of the Calcutta Botanical Gardens. It consists of twelve small patches of plants near Nongkiao, and one near Jirang, situated at elevations varying from 3500 feet to 5000 feet. The species cultivated are Cinchona succirubra, C. officinalis, and C. micrantha. At first they were under the charge of two Khási gardeners, who each received Rs. 16 a month, or £19, 4s. a year, to weed them and keep fires out. In 1874-75 these plantations were taken charge of by the Forest Department, and specimens of the cinchona bark were submitted for analysis to the Government Quinologist

II Gordon E-4, 9 (no date) 1907 AR? Khasi AR?

141 hills, and if one met them in the plains one would not be able to distinguish them from the ordinary Kachari or Bodda. The nose in the Khasi is somewhat depressed, the nostrils being often large and prominent. The forehead is broad and the space between the eyes is often considerable. The skull may be said to be almost brachy-cephalic, the average cephalic index of 77 Khasi subjects, measured by Col. Waddell and Major Hare, I.M.S., being as high as 77·9 and 77·9, respectively. According to these data the Khasis are more brachy-cephalic than the Aryans, whose measurements appear in Crooke's tables, more brachy-cephalic than the 100 Minchas whose measurements appear in Risley's tables, more brachy-cephalic than the Dravidians, but less brachy-cephalic than the Burmans, whose measurements also appear in Crooke's tables. It would be interesting to compare some head measurements of Khasis with Japanese, but unfortunately the necessary data are not available in the case of the latter people. The Khasi head may be styled sub-brachy-cephalic. Eyes are of medium size, in colour black or brown. In the Jaintia Hills hazel eyes are not uncommon, especially amongst females. Eyelids are somewhat obliquely set, but not so acutely as in the Chinese and some other Mongols. Jaws frequently are prognathous, mouth large, with sometimes rather thick lips. Hair black, straight, and worn long, the hair of people who adopt the old style being caught up in a knot at the back. Some make out the hair short with the exception of a single lock at the back, which is called *u sinkhrong* or *u nisk-i kwaiei* (i.e. the grandmother's lock.) The forepart of the head is often shaven. It is quite the exception to see a beard, although the moustache is not infrequently worn. The Lyngngam pull out the hairs of the moustache with the exception of a few hairs on either side of the upper lip.

142

143

PHYSICAL AND GENERAL CHARACTERISTICS.

142 The Khasis are usually short in stature, with bodies well nourished, and the males are extremely muscular. The trunk is long in proportion to the rest of the body, and broad at the waist; calves are very highly developed. The women when

[147]

IsGordon E-4, 9 (no date) 1907 AR? Khasi AR?

of anything except iron or steel, the result being that the sword is most awkward to hold, and could never have been of much use as a weapon of offence.

The same spear is used for throwing and casting. The spear is not decorated with wool or hair like the spears of the Naga tribes, but it is nevertheless a serviceable weapon, and would be formidable in the hand of a resolute man at close quarters. The length of the spear is about 6½ feet. The shaft is generally of bamboo, although sometimes of ordinary wood. The spear heads are forged in the local smithies.

The Khasi weapon par excellence is the bow. Although no "Robin Hoods," the Khasis are very fair archers, and they use the bow largely for hunting. The Khasi bow (*ka synteh*) is of bamboo, and is about 5 feet in height. The longest bow in use is said to be about the height of a man, the average height amongst the Khasis being about about 5 feet 2 inches to 5 feet 6 inches. The bowstring is of split bamboo, the bamboos that are used being a *spit*, a *sikhon*, and a *sip-lieh*.

The arrows (*ki khnam*) are of two kinds: (a) the lopped-headed (*ki plieng*), and (b) the plain-headed (*sep*). Both are made out of bamboo. The first kind is used for hunting, the latter for archery matches only. Archery may be styled the Khasi national game. A description of Khasi archery will be found under the heading "Games." The feathers of the following birds are used for arrows:—Vultures, geese, cranes, cormorants, and hornbills. Arrow-heads are made of iron or steel, and are forged locally. The distance a Khasi arrow will carry, shot from the ordinary bow by a man of medium strength, is 150 to 180 yards. The Khasi shield is circular in shape, of hide, and studded with brass or silver. In former days shields of rhinoceros hide are said to have been used, but nowadays buffalo skin is used. The shields would stop an arrow or turn aside a spear or sword thrust. The present-day shield is used merely for purposes of display.

Before the advent of the British into the hills the Khasis are said [illegible] been acquainted with the art of manufacturing gun[illegible] which was prepared in the neighbourhood of Mawsynram, Kyuchi, and Cherra. The gunpowder used to be

Dr. Hunter C-4 (no date) 1897 AR? Khasi AR?

144 "Ethnology.—In order to determine the ethnological position of the Khasis, we must dwell upon a few only of their physical characteristics, viz. those which are held to indicate the type of the human family, the Mongolian, to which they undoubtedly belong. A detailed description of their physiognomy would embrace form and character, by no means common even to tribes occupying the hills in close proximity to them, much less referable to all branches of the Mongolian stock. These differences in detail, which may be attributed mainly to local influences, render it extremely difficult, if not absolutely impossible, to trace out the exact relation which these mountain tribes bear to each other. But the Mongolian, or to use a more comprehensive term, the Turanian, physiognomy is unmistakable in them all—Khasis, Jaintias, Garos, Mikirs, Naga, Manipuris, etc. The chief points may be briefly stated as follows.—

142 Colour sunny or yellow, though a darker hue is not entirely
• [141] unknown; nose somewhat depressed, with a peculiar conformation
[302] towards the forehead at the glabellum, which is very flat and broad; face broad, flat, and squarish, with high and rounded cheek-bones; skull globular rather than square; eyes middle-sized and black, with a yellow tinge in the eyeball; eyelids obliquely set, but less acutely than in the Chinese and other Indo-Chinese races; mouth large, with prominent though not very thick lips; hair black, thick, and worn long, the orthodox style being to tie it up in a knot at the back, varying little with sex; beard remarkably sparse, but the
141 moustache more abundant than the beard. The lower classes go
[826] bare-headed; nature low in the majority of cases; constitution strong and robust; limbs thick, short, and stout; trunk long in proportion and very broad at the waist; calves over-developed, but this is considered an element of beauty, more especially in the women, who, on the average, are fairer and handsomer than the men, although ungraceful.

157 "Social and Moral Qualities.—Disposition very affable, gentle, and cheerful; rather industrious, but devoid of ingenuity and mechanical skill. In the industrial arts, such as masonry, carpentry,
291 and agriculture, they are amenable to training. Dress amongst the lower classes is confined to a fringed jacket rudely woven of hemp, extending down as far as the thighs, and leaving the arms bare, together with a scanty covering for the loins. The more respectable classes wear a turban of coarse cotton or silk for a head-dress, and a sheet of silk thrown loosely over the shoulders, together with a long

1:Gordon E-4,5 (no date) 1907 ART Khasi ART

district. The Lyngngam inhabit the western portion of the Khasi Hills proper. A line drawn north and south through the village of Nongpoh may be said to form their eastern boundary, and the Kamrup and Sylhet districts their northern and southern boundaries, respectively. The people known as *Bhois* in these hills, who are many of them really Mikirs, live in the low hills to the north and north-east of the district, the term "Bhoi" being a territorial name rather than tribal. The eastern boundary of the Lyngngam country may be said to form their north-western boundary. The Wars inhabit the precipitous slopes and deep valleys to the south of the district. Their country extends along the entire southern boundary of the district to the *Jaintiaia*, or *Kmahi-ing*, river where the Lyngngam territory may be said to commence towards the south. There are some Hadem colonies in the extreme eastern portions of the *Jaintia* Hills. It is these colonies which are sometimes referred to by other writers as "Kaki Colonies." They are settlers from the North Cachar Sub-division of the Cachar district within recent years. It is possible that the title Hadem may have some connection with *Hidimbat*, the ancient name for the North Cachar Hills.

APPEARANCE

The colour of the Khasi skin may be described as being usually brown, varying from dark to a light yellowish brown, according to locality. The complexion of the people who inhabit the uplands is of a somewhat lighter shade, and many of the women, especially those who live at Nongkrem, Laitlyngkot, Mawphlang, and other villages of the surrounding high plateaux, possess that pretty gipsy complexion that is seen in the South of Europe amongst the peasants. The people of Cherrapunji village are especially fair. The *Syntengs* of the *Jaintia* Hills are darker than the Khasi uplanders. The Wars who live in the low valleys are frequently more swarthy than the Khasis. The Bhois have the flabby-looking yellow skin of the Mikirs, and the Lyngngams are darker than the Khasis. The Lyngngams are probably the darkest complexioned people in the

young are comely, of a buxom type, and, like the men, with highly-developed calves, the latter always being considered a beauty. The children are frequently remarkably pretty. Khasis carry very heavy burdens, it being the custom for the coolie of the country to carry a maund, or 82 lbs. weight, or even more occasionally, on his back, the load being fixed by means of a cane band which is worn across the forehead; women carry almost as heavy loads as the men. The coolies, both male and female, commonly do the journey between Cherrapunji and Shillong, or between Shillong and Jowai, in one day, carrying the heavy loads above mentioned. Each of the above journeys is some thirty miles. They carry their great loads of rice and salt from Therria to Cherrapunji, an ascent of about 4,000 feet in some three to four miles, in the day. The Khasis are probably the best porters in the north of India, and have frequently been requisitioned for transport purposes on military expeditions.

The people are cheerful in disposition, and are light-hearted by nature, and, unlike the plains people, seem to thoroughly appreciate a joke. It is pleasant to hear on the road down to Therighat from Cherrapunji, in the early morning the whole hillside resounding with the songs of song and peals of laughter of the coolies, as they run nimbly down the short cuts on their way to market. The women are specially cheerful, and pass the time of day and bandy jokes with passers-by with quite an absence of reserve. The Khasis are certainly more industrious than the Assamese, are generally good-tempered, but are occasionally prone to sudden outbursts of anger, accompanied by violence. They are fond of music, and rapidly learn the hymn tunes which are taught them by the Welsh missionaries. Khasis are devoted to their offspring and the women make excellent nurses for European children, frequently becoming much attached to their little charges. The people, like the Japanese, are fond of nature. A Khasi loves a day out in the woods, where he thoroughly enjoys himself. If he does not go out shooting or fishing, he is content to sit still and contemplate nature. He has a separate name for each of the commoner birds and flowers. He also has names for many butterflies and moths. These are traits which are not found usually in the people of India.

It Gordon E-4, 5 (no date) 1907 AR? Khasi AR?

or difference. It is owing to these three different names being used for the same people that there has been so much confusion about Lyngngams previously; e.g. at one census they were named *Lyngngam*, at another they received the appellation of Garo, and at a third enumeration they were called Khasis. In Section I. the habitat of the Lyngngams has been roughly defined. It is impossible to define the Lyngngam country exactly, because these people are continually shifting their village sites owing to the exigencies of jhum cultivation, which has been described in Section II. Some of the Lyngngams preserve a tradition that they originally came from the Kamrup plains. It is interesting that a people, like the Garos in so many respects, should have the same idea as the Garos as to the hills on the south bank of the Brahmaputra not always having been their abode. The Garo legend is that they dwelt for some years in the Goalpara and Kamrup plains after they descended from Thibet, and before they moved to the Garo Hills; and there is unmistakable evidence of their occupation of both districts in the shape of certain Garo villages on both banks of the Brahmaputra for some little distance up the river. If, as I suspect, the Lyngngams are an offshoot of the Garos, it is, perhaps, possible that they entered the Khasi Hills much in the same way as the Garos entered the hill district to which they have given their name. The Lyngngams are much darker than the Khasis, and possess the Thibeto-Burman type of feature often to a marked degree. It is not extraordinary that they should have adopted some of the Khasi customs, for the Khasis, being the stronger people, would in course of time be bound to influence them in this respect. That the Lyngngams observe the matriarchate and erect (some class) memorial stones is not peculiar, because the Garos, like the Khasis, are also a matriarchal people (to a limited degree), and the custom of erecting memorial stones is not confined to the Khasis, for other hill tribes in Assam observe the practice, e.g. certain Naga tribes and the Mikirs; and the Garos themselves put up carved posts, called *kima*, in honour of the departed. Although there is not much intermarriage between the Khasis and the Lyngngams nowadays, perhaps in days gone by there was a mixture of blood, the result being the hybrid race we are now

considering. Some of the leading characteristics of the Lyngams will now be detailed. The Lyngams are by complexion swarthy, with features of Mongolian type. The men are of middle height and the women remarkably short, both sexes being not nearly so robust as the Khasis, a result due probably to climatic influences, for the Lyngams live in fever-haunted jungles. The men have very little hair about the face, although a scanty moustache is sometimes seen, the hairs in the centre being carefully plucked out, the result being two tufts on either side. Beards are never seen. The women are ill-favoured, and wear very little clothing. The men wear the shoulders coat of the Khasi and Mikir pattern, called *phong-maong*, which is made of cotton dyed red, blue, and white. This custom may have been borrowed from the Khasis. They do not grow their own cotton, but obtain it from the plains. They make their own dyes, *changlang* (red) and *kar ani-long* (black). A cotton cloth, barely enough for purposes of decency, is tied between the legs, the ends being allowed to hang down in front and behind. Sometimes an apron is worn in front. At the present day the men wear knitted woollen caps, generally black or red, of the Nongstoin pattern (a sort of fisherman's cap), but the elderly men and head-men wear turbans. The females wear a cotton cloth about eighteen inches broad round the loins, sometimes striped red and blue, but more often only dark blue. A blue or red cloth is thrown loosely across the shoulders by unmarried girls, but married women only wear the waist-cloth, like the Garos. A cloth is tied round the head by married women, sometimes Garo fashion. The women wear quantities of blue beads as necklaces, like their Garo sisters. They obtain the beads from the Garo markets at the foot of the hills. Brass ear-rings are worn by both sexes; the women, like the Garos, load their ears to such an extent with brass rings as to distend the holes greatly. Silver armlets are worn by the head-men only, or by those who possess the means to give a great feast to the villagers. This is the custom of the Garo *nokmas*, or head-men. Both sexes wear bracelets. The men also wear necklaces of beads. The rich wear necklaces of cornelian and another stone which is thought by the Lyngams to be valuable. A necklace of such stones is called *u'pieng blei* (god's necklace).

JOURNAL

OF THE

ASIATIC SOCIETY OF BENGAL.

Vol. LXXIII. Part III.—ANTHROPOLOGY AND COGNATE SUBJECTS.

No. 4.—1904.

101 *Note on the Khasis, Syntengs, and allied Tribes, inhabiting the Khasi and Jaintia Hills District in Assam.—By* Major P. R. T. Gurdon, *Superintendent of Ethnography in Assam.* (*With plates* III—IV).

[Read 3rd August, 1904.]

142 1. *Physical characteristics.*—The men are seldom tall; they are generally well made, and possess great strength of limb,—of leg in particular. Their features show a resemblance to those of the Japanese; their complexions are fair, noses flat, lips thick, and eyes very frequently obliquely set. The women are good-looking, of a bacon type, and are cheerful and pleasant-mannered. Children are sometimes exceedingly pretty. Khasis are inveterate chewers of *pân*,—both men, women, and children; the distances from place to place being measured by the number of betel-nuts that can be chewed on the journey. The hair of the males is shaved above the forehead pretty high up, and the remainder is gathered into a knot at the back of the head. Very few Khasis have much hair about the face. Both Khasis and Syntengs wear the sleeveless coat (*Ijymphong*) loin-cloth, *jain sliang* (a kind of

19: Assam G-3 (3316) 1965 057 Khasi 007

from October to December. For millet the seed is sown in April-May and reaped about six months later. Maize is usually sown in April-May and reaped in August-September. For potato, generally three crops are raised in the district; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

For oranges and bonduc the orchards are cleared of weeds twice a year. Harvesting of oranges takes place from October to January. Bonduc ripens at the beginning of the year and are collected between February and May.

2.6.3 Agricultural implements.—The usual agricultural implements are a hoe, a sickle, three or four kinds of dao, a harrow, a crowbar which is used for the construction of irrigation channels, 'winnowing' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Shillong area and remaining the use is not in the plains of the hills.

2.6.4. General cultural practices.—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Manuring is widely practised. Cultivation by making terraces in the hill sides is gaining popularity in the district.

2.7 Cottage Industries.—Cottage Industries, it appears, have not found very great favour among the people of the district. A few families here and there manufacture iron implements, earthenware, pottery, baskets, mats and jewellery. In weaving cotton with other materials cotton clothes is rare among the Khasis. The Mikirs in Shillong area and in areas adjoining North Cachar and Mikir Hills produce it only for their domestic consumption. At present, the Government is trying to popularise weaving in the district and this has been welcomed by the Khasis. Among other cottage industries production of art cotton in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

2.8 The People.—The Khasis and Jaintias are a short sturdy race distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour, they are free from any inhibitions. Side by side with the Khasis live the Mikirs, Garos and Nepalis who form respectively 7.32 percent, 3.38 percent and 7.27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

2.9 Occupation.—The greater portion of the population of the district subsists on cultivation. More than 75 percent of the rural households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

144 ETHNOLOGY.—It is not in determine the ethnological position of the Khasis we need dwell upon a few only of their physical characteristics, viz. those which are held to indicate that type of the human family, the Mongolian, to which they undoubtedly belong. A detailed description of their physiognomy would embrace forms and characters by no means common even to tribes occupying the hills in close proximity to them, much less adaptable to all branches of the Mongolian stock. These differences in detail, which may be attributed mainly to local influences, render it extremely difficult, if not absolutely impossible, to trace out the exact relation which these mountain tribes bear to each other. But the Mongolian, or to use a more comprehensive term, the Turanian, physiognomy is unmistakable in them all—Khasis, Jaintias, Garos, Mikirs, Naga, Manipuris, etc. The chief points may be briefly stated as follows:—

142 [141] [302] Colour tawny or yellow, though a darker hue is not entirely unknown; nose somewhat depressed, with a peculiar conformation towards the forehead at the glabellum, which is very flat and broad; face broad, flat, and squarish, with high and rounded cheek-bones; skull globular rather than square; eyes middle-sized and black, with a yellow tinge in the eyeball; eyelids obliquely set, but less acutely than in the Chinese and other Indo-Chinese races; mouth large, with prominent though not very thick lips; hair black, thick, and worn long, the orthodox style being to tie it up in a knot at the back, varying little with sex; beard remarkably sparse, but the moustache more abundant than the beard. The lower classes go

141 [826] bare-headed; stature low in the majority of cases; constitution strong and robust; limbs thick, short, and stout; trunk long in proportion and very broad at the waist; calves over-developed, but this is considered an element of beauty, more especially in the women, who, on the average, are fairer and handsomer than the men; carriage ungraceful.

157 SOCIAL AND MORAL QUALITIES.—Disposition very affable, gentle, and cheerful; rather industrious, but devoid of ingenuity and mechanical skill. In the industrial arts, such as masonry, carpentry,

291 and agriculture, they are amenable to training. Dress amongst the lower classes is confined to a fringed jacket rudely woven of hemp, extending down as far as the thighs, and leaving the arms bare, together with a scanty covering for the loins. The more respectable classes wear a turban of coarse cotton or silk for a head-dress, and a sheet of silk thrown loosely over the shoulders, together with a long

l: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

published in Trübner's series of "Simplified Grammars" in 1891, and there are dictionaries, English-Khasi (1875) and Khasi-English (1906), besides many other aids to the study of the language which need not be mentioned here. It is recognized by the Calcutta University as sufficiently cultivated to be offered for the examinations of that body. Two monthly periodicals are published in it at Shillong, to which place the headquarters of the District were removed from Cherrapunji in 1864, and which has been the permanent seat of the Assam Government since the Province was separated from Bengal in 1874.

The isolation of the Khasi race, in the midst of a great encircling population all of whom belong to the Tibeto-Burman stock, and the remarkable features presented by their language and institutions, soon attracted the attention of comparative philologists and ethnologists. An account of their researches will be found in Dr. Grierson's *Linguistic Survey of India*, vol. ii. Here it will be sufficient to mention the important work of Mr. J. R. Logan, who, in a series of papers published at Singapore between 1850 and 1857 in the *Journal of the Indian Archipelago* (of which he was the editor), demonstrated the relationship which exists between the Khasis and certain peoples of Further India, the chief representatives of whom are the Mōns or Talaings of Pegu and Tenasserim, the Khmērs of Cambodia, and the majority of the inhabitants of Annam. He was even able, through the means of vocabularies furnished to him by the late Bishop Bigandet, to discover the nearest kinsmen of the Khasis in the Palaungs, a tribe inhabiting one of the Shan States to the north-east of Mandalay on the middle Salween. With the progress of research it became apparent that the Mōn-Khmēr group of Indo-

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

114 China thus constituted, to which the Khasis belong, was
144 in some way connected with the large linguistic family in the Indian Peninsula once called Kolarian, but now more generally known as *Mundā*, who inhabit the hilly region of Chutia Nagpur and parts of the Satpura range in the Central Provinces. Of these tribes the principal are the Santhāls, the Mundās, and the Korkus. In physical characters they differ greatly from the Indo-Chinese Khasis, but the points of resemblance in their languages and in some of their institutions cannot be denied; and the exact nature of the relation between them is as yet one of the unsolved problems of ethnology.

114 The work of Logan was carried further by Prof.
197 Ernst Kuhn, of Munich, who in 1883 and 1889 published important contributions to our knowledge of the languages and peoples of Further India. More recently our acquaintance with the phonology of Khasi and its relatives has been still further advanced by the labours of Pater W. Schmidt, of Vienna, whose latest work, *Die Mon-Khmer Völker, ein Bindeglied zwischen Völkern Zentralasiens und Australiens* (Braunschweig, 1906), has established the relationship of Khasi not only to the Mōn-Khmēr languages, but also to Nicobarese and several dialects spoken by wild tribes in the Malay Peninsula.

There still remains much to be done before the speech of the Khasi nation can be considered to have been thoroughly investigated. In the *Linguistic Survey* four dialects are dealt with, the standard literary form, founded on the language of Cherrapunji, the *Pnār* or *Syntengā*, of Jowai, the *War*, spoken in the valleys on the southern face of the hills, and the *Lynngām*, spoken in the tract adjacent to the Garos on the west. Major Gurdon (p. 203) mentions a fifth, that of Jirang

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

147 villages, such as Shella, Borpunji, Umniuh, and in Narpuh in
132 the Jaintia Hills.
361

ORIGIN.

173 The origin of the Khasis is a very vexed question. Although it is probable that the Khasis have inhabited their present abode for at any rate a considerable period, there seems to be a fairly general belief amongst them that they originally came from elsewhere. The Rev. H. Roberts, in the introduction to his Khasi Grammar, states that "tradition, such as it is, connects them politically with the Burmese, to whose king they were up to a comparatively recent date rendering homage, by sending him an annual tribute in the shape of an axe, as an emblem merely of submission." Another tradition points out the north as the direction from which they migrated, and Sylhet as the terminus of their wanderings, from which they were ultimately driven back into their present hill fastnesses by a great flood, after a more or less peaceful occupation of that district. It was on the occasion of this great flood, the legend runs, that the Khasi lost the art of writing, the Khasi losing his book whilst he was swimming at the time of this flood, whereas the Bengali
[212] managed to preserve his. Owing to the Khasis having possessed no written character before the advent of the Welsh missionaries, there are no histories as is the case with the Ahoms of the Assam Valley, and therefore no record of their journeys.
114 Mr. Shadwell, the oldest living authority we have on the
173 Khasis, and one who has been in close touch with the people for more than half a century, mentions a tradition amongst them that they originally came into Assam from Burma *viâ* the Patkoi range, having followed the route of one of the Burmese invasions. Mr. Shadwell has heard them mention the name Patkoi as a hill they met with on their journey. All this sort of
144 thing is, however, inexpressibly vague. In the chapter dealing
173 with "Affinities" have been given some reasons for supposing that the Khasis and other tribes of the Mon-Anam family, originally occupied a large portion of the Indian continent. Where the actual cradle of the Mon-Anam race was, is as

l: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

impossible to state, as it is to fix upon the exact tract of country from which the Aryans sprang. With reference to the Khasi branch of the Mon-Anam family, it would seem reasonable to suppose that if they are not the autochthons of a portion of the hills on the southern bank of the Brahmaputra, and if they migrated to Assam from some other country, it is not unlikely that they followed the direction of the different irruptions of foreign peoples into Assam of which we have authentic data, i.e. from south-east to north-west, as was the case with the Ahom invaders of Assam who invaded Assam from their settlements in the Shan States *viâ* the Patkoi range, the different Burmese invasions, the movements of the Khamtis and, again, the Singphos, from the country to the east of the Hukong Valley. Whether the first cousins of the Khasis, the Mons, moved to their present abode from China, whether they are the aborigines of the portion of Burma they at present occupy, or were one of the races "of Turanian origin" who, as Forbes thinks, originally occupied the valley of the Ganges before the Aryan invasion, must be left to others more qualified than myself to determine. Further, it is difficult to clear up the mystery of the survival, in an isolated position, of people like the Ho-Mundas, whose language and certain customs exhibit points of similarity with those of the Khasis, in close proximity to the Dravidian tribes and at a great distance from the Khasis, there being no people who exhibit similar characteristics inhabiting countries situated in between; but we can, I think, reasonably suppose that the Khasis are an offshoot of the Mon people of Further India in the light of the historical fact I have quoted, i.e. that the movements of races into Assam have usually, although not invariably, taken place from the east, and not from the west. The tendency for outside people to move into Assam from the east still continues.

Affinities.

The late Mr. S. E. Peal, F.R.G.S., in an interesting and suggestive paper published in the Journal of the Asiatic Society of Bengal in 1896, drew attention to certain illustrations of

1:Gurdon E-4,5 (no date) 1907 AR7 Khasi AR7

[114]
412
171
144

"singular shoulder-headed celts," found only in the Malay Peninsula till the year 1875, when they were also discovered in Chota Nagpur, and figured in the Journal of the Asiatic Society of Bengal for June of that year. These "celts" are, as the name implies, ancient stone implements. Mr. Peal goes on to state the interesting fact that when he was at Ledo and Tikak, Naga villages, east of Makum, on the south-east frontier of the Lakhimpur district of Assam, in 1895, he found iron implements, miniature hoes, used by the Nagas, of a similar shape to the "shoulder-headed celts" which had been found in the Malay Peninsula and Chota Nagpur. Now the peculiarly shaped Khasi hoe or *mo-khiw*, a sketch of which is given, with its far projecting shoulders, is merely an enlarged edition of the Naga hoe described by Peal, and may therefore be regarded as a modern representative in iron, although on an enlarged scale, of the "shoulder-headed celts." Another interesting point is that, according to Forbes, the Burmese name for these stone celts is *mo-gyo*. Now the Khasi name for the hoe is *mo-khiw*. The similarity between the two words seems very strong. Forbes says the name *mo-gyo* in Burmese means "cloud or sky chain," which he interprets "thunderbolt," the popular belief there, as in other countries, being that these palæolithic implements fell from heaven. Although the Khasi name *mo-khiw* has no connection whatsoever with aerolites, it is a singular coincidence that the name for the Khasi hoe of the present day should almost exactly correspond with the Burmese name for the palæolithic implement found in Burma and the Malay Peninsula, and when it is remembered that these stone celts are of a different shape from that of the stone implements which have been found in India (with the exception of Chota Nagpur), there would seem to be some grounds for believing that the

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Khasis are connected with people who inhabited the Malay Peninsula and Chota Nagpur at the time of the Stone Age.* That these people were what Logan calls the Mon-Anam, may possibly be the case. Mr. Peal goes on to state, "the discovery is interesting for other reasons, it possibly amounts to a demonstration that Logan (who it is believed was the first to draw attention to the points of resemblance between the languages of the Mon-Anam or Mon-Khmêr and those of the Mundas and the Khasis), was correct in assuming that at one time the Mon-Anam races and influence extended from the Vindyas all over the Ganges Basin, even over Assam, the northern border of the Ultra Indian Peninsula." Mr. Peal then remarks that the Eastern Nagas of the Tirap, Namstik, and Sonkap group "are strikingly like them (i.e. the Mon-Anam races), in many respects, the women being particularly robust, with pale colour and at times rosy cheeks." The interesting statement follows that the men wear the Khasi-Mikir sleeveless coat. Under the heading of dress this will be found described as a garment which leaves the neck and arms bare, with a fringe at the bottom and with a row of tassels across the chest, the coat being fastened by frogs in front. It is a garment of a distinctive character and cannot be mistaken; it used to be worn largely by the Khasis, and is still used extensively by the Syntengs and Lynngams and by the Mikirs, and that it should have been found amongst these Eastern Nagas is certainly remarkable. It is to be regretted that the investigations of the Ethnographical Survey, as at present conducted, have not extended to these Eastern Nagas, who inhabit tracts either outside British territory or in very remote places on its confines, so that we are at present unable to state whether any of these tribes possess other points of affinity, as

* It is interesting to compare the remarks of M. Aymonier in his volume iii. of "Le Cambodge." He writes as follows:—"Mais en Indo-Chine on trouve, partout disseminé, ce que les indigènes, au Cambodge du moins, appellent, comme les peuples les plus éloignés du globe 'les traits de foudre.' Ce sont ici des haches de l'âge néolithique ou de la pierre polie, dont la plupart appartiennent au type repandu en toute la terre. D'autres de ces celtes, dits épaulés, parcequ'ils possèdent un talon d'une forme particulière, paraissent appartenir en propre à l'Indo-Chine et à la presqu'île dekkhanique. Ils fourniraient donc un premier indice, non négligeable, d'une communauté d'origine des populations primitives des deux péninsules, cis et trans gangétiques."

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

144 regards social customs, with the Khasis; but it will be noticed
211 in the chapter dealing with memorial stones that some of the
171 Naga tribes are in the habit of erecting monoliths somewhat similar in character to those of the Khasis, and that the Mikirs (who wear the Khasi sleeveless coat), erect memorial stones exactly similar to those of the Khasis. The evidence seems to suggest a theory that the Mon-Anam race, including of course the Khasis, occupied at one time a much larger area in the mountainous country to the south of the Brahmaputra in Assam than it does at present. Further references will be found to this
144 point in the section dealing with memorial stones. The fact
171 that the Ho-Mundas of Chota Nagpur also erect memorial stones and that they possess death customs very similar to those of the Khasis, has also been noticed in the same chapter. We have, therefore, the following points of similarity as regards customs between the Khasis on the one hand, certain Eastern Naga tribes, the Mikirs, and the ancient inhabitants of the Malay Peninsula on the other :—

(a) Peculiarly shaped hoe, i.e. the hoe with far projecting shoulders	1. Khasis. 2. Certain Eastern Naga tribes. 3. The ancient inhabitants of the Malay Peninsula. 4. The ancient inhabitants of Chota Nagpur (the Ho-Mundas ?).
(b) Sleeveless coat	1. Khasis. 2. Mikirs. 3. Certain Eastern Naga tribes.
(c) Memorial stones	1. Khasis. 2. Mikirs. 3. Certain Eastern Naga tribes. 4. Ho-Mundas of Chota Nagpur.

197 I wish to draw no definite conclusions from the above facts,
144 but they are certainly worth considering with reference to Logan's theory as stated by Peal: the theory being based on Logan's philological inquiries. Thanks to the labours of Grierson, Logan, and Kuhn in the linguistic field, we know that the languages of the Mon-Khmêr group in Burma and the Malay Peninsula are intimately connected with Khasi. I say, intimately, advisedly, for not only are roots of words seen to be similar, but the order of the words in the sentence is found to be the same, indicating that both these people think in the same order when wishing to express themselves by speech.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

There are also syntactical agreements. We may take it as finally proved by Dr. Grierson and Professor Kuhn that the Mon-Khmèr, Palaung, Wa, and Khasi languages are closely connected. In the section of the Monograph which deals with language some striking similarities between the languages of these tribes will be pointed out. We have not so far been able to discover social customs common to the Palaungs and the Khasis; this is probably due to the conversion of the Palaungs to Buddhism, the change in the religion of the people having possibly caused the abandonment of the primitive customs of the tribe. In a few years' time, if the progressive rate of conversions of Khasis to Christianity continues, probably the greater number of the Khasi social customs will have disappeared and others will have taken their place, so that it cannot be argued that because no manifest social customs can now be found common to the Khasis and the Palaungs, there is no connection between these two tribes. The strong linguistic affinity between these two peoples and the wild *Was* of Burma points to an intimate connection between all three in the past. As knowledge of the habits of the wild *Was* improves, it is quite possible that social customs of this tribe may be found to be held in common with the Khasis. With regard to social affinities it will be interesting to note the Palaung folk-tale of the origin of their Sawbwa, which is reproduced in Sir George Scott's Upper Burma Gazetteer. The Sawbwa, it is related, is descended from the Naga Princess Thusandi who lived in the *Nat* tank on the Mongok hills and who laid three eggs, from one of which was born the ancestor of the Palaung Sawbwa. Here we see how the Palaung regards the egg, and it is noteworthy that the Khasis lay great stress on its potency in divination for the purposes of religious sacrifices, and that at death it is placed on the stomach of the deceased and is afterwards broken at the funeral pyre. Amongst some of the tribes of the Malay Archipelago also the *Gaji-Guru* or medicine-man "can see from the yolk of an egg, broken whilst sacramentally counting from one to seven, from what illness a man is suffering and what has caused it." Here we have an almost exactly parallel case to the Khasi custom of egg-breaking.

In the Palaung folk-tale above referred to the importance of

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

144 the egg in the eyes of Palaung is demonstrated, and we know
825 how the Khasi regards it. But the folk-tale is also important
171 as suggesting that the ancient people of Pagan were originally serpent-worshippers, i.e. Nágás, and it is interesting to note that the Rumai or Palaung women of the present day "wear a dress which is like the skin of the Naga (snake)." Is it possible that the Khasi superstition of the *thlen*, or serpent demon, and its worship, an account of which will be found under the heading of "Human Sacrifices" in the Monograph, has anything to do with the ancient snake-worship of the people of Pagan, and also of the ancient inhabitants of Naga-Dwipa, and that amongst the wild *Was* the custom of head-hunting may have taken the place of the Khasi human sacrifices to the *thlen?*

Notwithstanding that Sir George Scott says the story has very Burman characteristics, the Palaung folk-tale is further interesting in that it speaks of the Sawbwa of the Palaungs being descended from a *princess*. This might be a suggestion of the matriarchate.

171 It can well be imagined how important a matter it is also,
144 in the light of Grierson's and Kuhn's linguistic conclusions, to ascertain whether any of the Mon-Khmêr people in Anam and Cambodia and neighbouring countries possess social customs in common with the Khasis. In case it may be possible for French and Siamese ethnologists in Further India to follow up these inquiries at some subsequent date, it may be stated that information regarding social customs is required with reference to the people who speak the following languages in Anam and Cambodia and Cochin China which belong to the Mon-Khmêr group—*Suk, Stieng, Bahnar, Anamese, Khamen-Boran, Xong, Samre, Khmu*, and *Lamet*.

Notwithstanding our failure up till now to find any patent and direct social customs in common between the Khasis and the Palaungs, I am in hopes that we may yet discover some such affinities. Mr. Lowis, the Superintendent of Ethnography in Burma, states that there is no vestige of the matriarchal system among the Palaungs; but there is the folk-tale I have quoted above. In matters of succession, inheritance, &c., the Palaungs, Mr. Lowis, says, profess to follow the Shans, whose customs in this regard have a Buddhistic basis. The Palaungs

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

are devout Buddhists, and, like the Burmans and Shans, bury their lay dead, whereas the Khasis invariably burn. There is nothing in the shape of memorial stones amongst the Palaungs. *Primâ facie* these appear to be points of differentiation between the Palaungs and the Khasis; but they should not, as has already been stated, be regarded as proof positive that the tribes are not connected, and it is possible that under the influence of Buddhism the Palaungs may have almost entirely abandoned their ancient customs, like the Christian Khasis.

Having noticed some similarities as regards birth customs, as described in Dr. Frazer's "Golden Bough," between the Khasis and certain inhabitants of the Dutch East Indies, I wrote to the Dutch authorities in Batavia requesting certain further information. My application was treated with the greatest courtesy, and I am indebted to the kindness of the President, his secretary, and Mr. C. M. Pleyte, Lecturer of Indonesian Ethnology at the Gymnasium of William III., at Batavia, for some interesting as well as valuable information. With reference to possible Malay influence in the countries inhabited by the people who speak the Mon-Khmêr group of languages in Further India, it was thought desirable to ascertain whether any of the people inhabiting the Dutch East Indies possessed anything in common with the Khasis, who also belong to the Mon-Khmêr group. There are, according to Mr. Pleyte, pure matriarchal customs to be found amongst the Minangkabe Malays inhabiting the Padang uplands and adjacent countries, in Sumatra, in Agam, the fifty Kotas, and Tanah Datar, more or less mixed with patriarchal institutions; they are equally followed by the tribes inhabiting parts of Korinchi and other places. The apparently strong survival of the matriarchate in parts of the island of Sumatra, as compared with this corresponding most characteristic feature of the Khasis, is a point for consideration. Mr. Pleyte goes on to state "regarding ancestor-worship, it may be said that this is found everywhere throughout the whole Archipelago; even the tribes that have already adopted Islam, venerate the spirits of their departed." The same might be said of some of the Khasis who have accepted Christianity, and much more of the Japanese. I would here refer the reader to the chapter on "Ancestor-worship." In the

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

171 Southern Moluccas the placenta is mixed with ashes, placed in
144 a pot, and hung on a tree; a similar custom is observed in Mandeling, on the west coast of Sumatra. This is a custom universally observed amongst the Khasis at births. Teknonomy to some extent prevails amongst some of these Malay tribes as with the Khasis. It will be seen from the above notes that there are some interesting points of affinity between the Khasis and some of the Malay tribes, and if we add that the Khasis are decidedly Malay in appearance, we cannot but wonder whether the Malays have any connection not only with the Mon-Khmer family, but also with the Khasis, with the Ho-Mundas, and with the Naga tribes mentioned by Mr. Peal in his interesting paper published in the Journal of the Asiatic Society of Bengal, already referred to. We will study the strong linguistic affinities between these peoples in the section which deals with language.

M. Aymonier in "Le Cambodge" mentions the matriarchate as having been prevalent apparently amongst the primitive races of Cambodia, and notes that the ancient Chinese writers spoke of Queens in Fou-nan (Cambodia). If the Khmêrs were the ancient people of Cambodia, here we have an important landmark in common between them and the Khasis. M. Aymonier goes on to speak of priestesses, and the Cambodian taboo, *tam* or *trenam*, which Mr. Lewis, the Superintendent of Ethnography in Burma, suggests may be akin to the Khasi *sang*.

DRESS.

291 Dress may be divided into two divisions, ancient and modern. It will be convenient to take the former division first. The Khasi males of the interior wear the sleeveless coat or *jymphong*, which is a garment leaving the neck and arms bare, with a fringe at the bottom, and with a row of tassels across
[172] the chest; it is fastened by frogs in front. This coat, however, may be said to be going out of fashion in the Khasi Hills, its place being taken by coats of European pattern in the more civilized centres and by all sorts of nondescript garments in the interior. The sleeveless coat, however, is still worn by many

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

or difference. It is owing to these three different names being 101
used for the same people that there has been so much confusion
about Lynngams previously; e.g. at one census they were named
Lynngam, at another they received the appellation of Garo, and
at a third enumeration they were called Khasis. In Section I. 131
the habitat of the Lynngams has been roughly defined. It is 361
impossible to define the Lynngam country exactly, because 173
these people are continually shifting their village sites
owing to the exigencies of *jhum* cultivation, which has been
described in Section II. Some of the Lynngams preserve
a tradition that they originally came from the Kamrup
plains. It is interesting that a people, like the Garos in so
many respects, should have the same idea as the Garos as to the
hills on the south bank of the Brahmaputra not always having
been their abode. The Garo legend is that they dwelt for 173
some years in the Goalpara and Kamrup plains after they 361
descended from Thibet, and before they moved to the Garo 144
Hills; and there is unmistakable evidence of their occupation of
both districts in the shape of certain Garo villages on both
banks of the Brahmaputra for some little distance up the river.
If, as I suspect, the Lynngams are an offshoot of the Garos, it
is, perhaps, possible that they entered the Khasi Hills much in
the same way as the Garos entered the hill district to which
they have given their name. The Lynngams are much darker 142
than the Khasis, and possess the Thibeto-Burman type of 177
feature often to a marked degree. It is not extraordinary that
they should have adopted some of the Khasi customs, for the
Khasis, being the stronger people, would in course of time be
bound to influence them in this respect. That the Lynngams 611
observe the matriarchate and erect (some clans) memorial 211
stones is not peculiar, because the Garos, like the Khasis, are 764
also a matriarchal people (to a limited degree), and the custom
of erecting memorial stones is not confined to the Khasis, for
other hill tribes in Assam observe the practice, e.g. certain
Naga tribes and the Mikirs; and the Garos themselves put up
carved posts, called *kima*, in honour of the departed. Although 582
there is not much intermarriage between the Khasis and the 101
Lynngams nowadays, perhaps in days gone by there was a 144
mixture of blood, the result being the hybrid race we are now

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

public auction. The Assam rules, as revised in 1875-76, reserve to Government the right of pre-emption at the price of Rs. 600 (£60) in the case of every elephant captured between 6 feet and 7½ feet in height. For every elephant caught that is not purchased by Government, a royalty of Rs. 100 (£10) is payable within one month after capture. Certain methods of hunting are prohibited. 224 648 651

POPULATION.—Prior to 1872 no attempts had been made at a Census of the Khási and Jáintiá Hills, but in 1870 the Deputy-Commissioner approximately estimated the population at 118,925 souls. In 1872, at the time of the Bengal Census, operations were set on foot in these Hills, but on a less elaborate system than in Regulation Districts. In the Khási Hills, the Census of the various petty States was effected through the chiefs; in British territory in the Jáintiá Hills, the *dolloïs* conducted the enumeration; while at Shillong and other places under direct administration, the work was done by officers attached to the Deputy-Commissioner's office. The results are thus returned:—Adults—males, 39,882; and females, 44,298: total adults, 84,280. Children under twelve years of age—males, 28,611; and females, 28,947: total children, 57,558. Total males, 68,593; total females, 73,245. Grand total, 141,838; proportion of males, 48·36 per cent. The total area of the District, according to the latest returns, is 6157 square miles, which gives an average density of 23 persons per square mile. The number of villages is 1003; the number of houses, 30,557, of which 350 are returned as of the better sort. 648 659 161 161 162

ETHNICAL DIVISION OF THE PEOPLE.—The population consists almost exclusively of aboriginal tribes and races, viz. Khásiás and Syntengs (who form the bulk of the inhabitants of the Khási and Jáintiá Hills respectively), Míkírs, Gáros, and Kukis. The only other dwellers in the Hills are the European officials and military officers at Shillong and Cherrá Púnjí, with their native servants and followers, a few Bengálí officials, and the sepoys of a regiment of native infantry. The classification of the inhabitants according to religion shows:—141,283 aborigines; 365 Hindus; 62 Muhammadans; and 128 Christians, including 35 Europeans, 8 Eurasians, and 85 native converts. 563 162 [648] [779]

THE KHASIAS.—The following sketch of the physical characteristics and customs of the Khásiás has been kindly furnished to me by the Deputy-Commissioner, Colonel Bivar; it is reproduced almost verbatim from his report and on his authority:— 144

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

144 'ETHNOLOGY.—In order to determine the ethnological position of the Khásiás, we need dwell upon a few only of their physical characteristics, viz. those which are held to indicate that type of the human family, the Mongolian, to which they undoubtedly belong. A detailed description of their physiognomy would embrace forms and characters by no means common even to tribes occupying the hills in close proximity to them, much less referable to all branches of the Mongolian stock. These differences in detail, which may be attributed mainly to local influences, render it extremely difficult, if not absolutely impossible, to trace out the exact relation which these mountain tribes bear to each other. But the Mongolian, or to use a more comprehensive term, the Turanian, physiognomy is unmistakeable in them all—Khásiás, Jáintiás, Gáros, Mikírs, Nágás, Manipuris, etc. The chief points may be briefly stated as follows:—
142 Colour tawny or yellow, though a darker hue is not entirely
[141] unknown; nose somewhat depressed, with a peculiar conformation
[302] towards the forehead at the glabellum, which is very flat and broad; face broad, flat, and squarish, with high and rounded cheek-bones: skull globular rather than square; eyes middle-sized and black, with a yellow tinge in the eyeball; eyelids obliquely set, but less acutely than in the Chinese and other Indo-Chinese races; mouth large, with prominent though not very thick lips; hair black, thick, and worn long, the orthodox style being to tie it up in a knot at the back, varying little with sex; beard remarkably sparse, but the
141 moustache more abundant than the beard. The lower classes go
[826] bare-headed; stature low in the majority of cases; constitution strong and robust; limbs thick, short, and stout; trunk long in proportion and very broad at the waist; calves over-developed, but this is considered an element of beauty, more especially in the women, who, on the average, are fairer and handsomer than the men; carriage ungraceful.

157 'SOCIAL AND MORAL QUALITIES.—Disposition very affable, gentle, and cheerful; rather industrious, but devoid of ingenuity and mechanical skill. In the industrial arts, such as masonry, carpentry,
291 and agriculture, they are amenable to training. Dress amongst the lower classes is confined to a fringed jacket rudely woven of hemp, extending down as far as the thighs, and leaving the arms bare, together with a scanty covering for the loins. The more respectable classes wear a turban of coarse cotton or silk for a head-dress, and a sheet of silk thrown loosely over the shoulders, together with a long

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

105 It will here be recalled that the Khasi are a matrilineal agricultural
[175] people, pre-litterate until the advent of the British in the sixth decade of
[197] the 19th century, organized under democratically ruling *siem*, or Khasi
princes and chieftains and speaking an Austro-Asiatic language [14]. Their
144 physical affinities are unmistakably mongoloid and quite distinct from the Assamese speaking plains-Indians, — but not from the other mountaineers of Assam, Nepal and even Burmah or China, with whom they feel to be more closely related, as with the Indian phinspeople, as some of the tribal designations in the following lists of terms for Non-Khasi testifies (comp. No. 41 as against No. 42, 43 and 43/*a-e*).

114 In the collection of the material, I was hampered by my inability to
122 pick up the Khasi language sufficiently quickly, for conversation without the help of an interpreter, but on the other hand greatly eased by generous and voluntary assistance on the part of several Khasi friends, especially U Ekiman Singh, the President, Unitarian Union, Khasi- and Jaintai Hills and his (Khasi) wife, Ka Austria [15], who offered me hospitality in their house at Maw Syn Jri, during my stay there. Dr. H. LYNGDOH, Shillong, the author of detailed accounts on Khasi religious ceremonial and institutions [16], U Jeeban Roy, a leading Pnár gentleman of Jowei in the Jaintia Hills, Ka Ellen Giri, Principal, Govt. Basic Education Training Centre, Malki, Shillong, Ka Kongmen, Shillong, and U David Roy, Prime Minister (retd.), and a number of hospitable Wár Khasi and Wár-Jaintia pan-leaf cultivators in the southern slopes of the Khasi- and Jaintia Hills, especially from the villages Mawlat and Padu, also helped me greatly in my task. My thanks are due to all of them.

101 The data, submitted and briefly described in this paper were thus
114 collected in four different areas.

1. The South-eastern corner of the Khasi-Hills (plateau-area),
2. the southern slopes of the Khasi Hills, the "Wár-Khasi country" between the Khasi plateau proper and the northern boundary of East Pakistan,
3. the central plateau of the Jaintia Hills, round its capital market Jowei, and
4. the southern slopes of the Jaintia Hills, the "Wár-Jaintia country" between these and a section of the northern boundary of East Pakistan, further to the East than area 2.

197 Slightly different Khasi dialects are spoken in these four regions, Jaintia (Pnár or "Synteng") and Wár-Jaintia being more akin to each other, similarly as Plateau-Khasi and Wár-Khasi are.

101 The Pnár or Jaintias ("Synteng" is a slightly opprobious designation,
175 used by the Plateau-Khasi for these, their eastern neighbours) look back

[14] SCHMIDT (1906).

[553] [15] So named, because Austria was much in the news at the time of her birth, during the first world war; — a fact which illustrates the Khasi peculiarity to use either ad hoc inventions as names for children, or to adopt such, from the Khasi point of view, outlandish words like: "Ka Austria" or "Ka Mediterranean Sea" as names for their children.

[16] LYNGDOH (1937).

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two of three generations ago told the story to U Siang (one of

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

142 hills, and if one met them in the plains one would not be able to distinguish them from the ordinary Kachari or Rabha. The nose in the Khasi is somewhat depressed, the nostrils being often large and prominent. The forehead is broad and the 141 space between the eyes is often considerable. The skull may be said to be almost brachy-cephalic, the average cephalic index of 77 Khasi subjects, measured by Col. Waddell and Major Hare, I.M.S., being as high as 77·3 and 77·9, respectively. According to these data the Khasis are more brachy-cephalic than the Aryans, whose measurements appear in Crooke's tables, more brachy-cephalic than the 100 Mundas whose measurements appear in Risley's tables, more brachy-cephalic than the Dravidians, but less brachy-cephalic than the Burmans, whose measurements also appear in Crooke's tables. It would be interesting to compare some head measurements of Khasis with Japanese, but unfortunately the necessary data are not available in the case of the latter people. The Khasi head 142 may be styled sub-brachy-cephalic. Eyes are of medium size, in colour black or brown. In the Jaintia Hills hazel eyes are not uncommon, especially amongst females. Eyelids are somewhat obliquely set, but not so acutely as in the Chinese and some other Mongols. Jaws frequently are prognathous, mouth large, with sometimes rather thick lips. Hair black, straight, and 302 worn long, the hair of people who adopt the old style being caught up in a knot at the back. Some males cut the hair short with the exception of a single lock at the back, which is called *u niuhtrong* or *u niuh-' iawbei* (i.e. the grandmother's lock.) The forepart of the head is often shaven. It is quite the exception to see a beard, although the moustache is not infrequently worn. The Lynngams pull out the hairs of the moustache with the exception of a few hairs on either side of the upper lip.

PHYSICAL AND GENERAL CHARACTERISTICS.

142 The Khasis are usually short in stature, with bodies well [147] nourished, and the males are extremely muscular. The trunk is long in proportion to the rest of the body, and broad at the waist; calves are very highly developed. The women when

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

000 which are not found usually in the people of India. He is
461 not above manual labour, and even the Khasi clerk in the
333 Government offices is quite ready to take his turn at the hoe
335 in his potato garden. The men make excellent stonemasons and carpenters, and are ready to learn fancy carpentry and
276 mechanical work. They are inveterate chewers of *supari* and
804 the pan leaf (when they can get the latter), both men, women, and children; distances in the interior being often measured by the number of betel-nuts that are usually chewed on a
273 journey. They are not addicted usually to the use of opium or other intoxicating drugs. They are, however, hard drinkers, and consume large quantities of spirit distilled from rice or millet. Rice beer is also manufactured; this is used not only as a beverage, but also for ceremonial purposes. Spirit drinking is confined more to the inhabitants of the high plateaux and to the people of the Wár country, the Bhois and Lynngams
276 being content to partake of rice beer. The Mikirs who inhabit
751 what is known as the "Bhoi" country, lying to the north of the district, consume a good deal of opium, but it must be remembered that they reside in a malarious *terai* country, and that the use of opium, or some other prophylactic, is probably
525 beneficial as a preventive of fever. The Khasis, like other people of Indo-Chinese origin, are much addicted to gambling.
577 The people, and especially those who inhabit the Wár country, are fond of litigation. Col. Bivar remarks, "As regards truthfulness the people do not excel, for they rarely speak the truth unless to suit their own interests." Col. Bivar might have confined this observation to the people who live in the larger centres of population, or who have been much in contact with the denizens of the plains. The inhabitants of the far interior are, as a rule, simple and straightforward people, and are quite as truthful and honest as peasants one meets in other countries. My impression is that the Khasis are not less truthful certainly than other Indian communities. McCosh, writing in 1837, speaks well of the Khasis. The following is his opinion of them:—"They are a powerful, athletic
• [147] race of men, rather below the middle size, with a manliness of gait and demeanour. They are fond of their mountains, and look down with contempt upon the degenerate race of the

1/1 [the Khasi --- Anal pt]

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

limestone caves and underground water-courses on the southern face of the hills. This series contains coal-beds, e.g. the Cherra-field and that at Lakadong in the Jaintia Hills. Some description of the remarkable Kyllang Rock may not be out of place. Sir Joseph Hooker describes it as a dome of red granite, 5,400 feet above sea level, accessible from the north and east, but almost perpendicular to the southward where the slope is 80° for 600 feet. The elevation is said by Hooker to be 400 feet above the mean level of the surrounding ridges and 700 feet above the bottom of the valleys. The south or steepest side is encumbered with enormous detached blocks, while the north is clothed with forests containing red tree-rhododendrons and oaks. Hooker says that on its skirts grows a "white bushy rhododendron," which he found nowhere else. There is, however, a specimen of it now in the Shillong Lake garden. Numerous orchids are to be found in the Kyllang wood, notably a beautiful white one, called by the Khasis *u'tiw kyllang synrai*, which blooms in the autumn. The view from the top of the rock is very extensive, especially towards the north, where a magnificent panorama of the Himalayas is obtained in the autumn. The most remarkable phenomenon of any kind in the country is undoubtedly the enormous quantity of rain which falls at Cherrapunji.* Practically the whole of the rainfall occurs in the rains, i.e. from May to October. The remainder of the district is less rainy. The climate of the central plateau of the Shillong range is very salubrious, but the low hills in parts of the district are malarious. The effect of the different climates can at once be seen by examining the physique of the inhabitants. The Khasis who live in the high central plateaux are exceptionally healthy and strong, but those who live in the unhealthy "Bhoi country" to the north, and in the Lyngngam portion to the west of the district, are often stunted and sickly. Not so, however, the Wars who live on the southern slopes, for although their country is very hot at certain times of the year, it does not appear to be abnormally unhealthy except in certain

* The average rainfall at the Cherrapunji Police Station during the last twenty years, from figures obtained from the office of the Director of Land Records and Agriculture, has been 449 inches. The greatest rainfall registered in any one year during the period was in 1896, when it amounted to 641 inches.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

147 villages, such as Shella, Borpunji, Umniuh, and in Narpuh in
132 the Jaintia Hills.
361

ORIGIN.

173 The origin of the Khasis is a very vexed question. Although it is probable that the Khasis have inhabited their present abode for at any rate a considerable period, there seems to be a fairly general belief amongst them that they originally came from elsewhere. The Rev. H. Roberts, in the introduction to his Khasi Grammar, states that "tradition, such as it is, connects them politically with the Burmese, to whose king they were up to a comparatively recent date rendering homage, by sending him an annual tribute in the shape of an axe, as an emblem merely of submission." Another tradition points out the north as the direction from which they migrated, and Sylhet as the terminus of their wanderings, from which they were ultimately driven back into their present hill fastnesses by a great flood, after a more or less peaceful occupation of that district. It was on the occasion of this great flood, the legend runs, that the Khasi lost the art of writing, the Khasi losing his book whilst he was swimming at the time of this flood, whereas the Bengali [312] managed to preserve his. Owing to the Khasis having possessed no written character before the advent of the Welsh missionaries, there are no histories as is the case with the Ahoms of the Assam Valley, and therefore no record of their journeys.
114 Mr. Shadwell, the oldest living authority we have on the
173 Khasis, and one who has been in close touch with the people for more than half a century, mentions a tradition amongst them that they originally came into Assam from Burma *viâ* the Patkoi range, having followed the route of one of the Burmese invasions. Mr. Shadwell has heard them mention the name Patkoi as a hill they met with on their journey. All this sort of
144 thing is, however, inexpressibly vague. In the chapter dealing
173 with "Affinities" have been given some reasons for supposing that the Khasis and other tribes of the Mon-Anam family, originally occupied a large portion of the Indian continent. Where the actual cradle of the Mon-Anam race was, is as

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

There are also syntactical agreements. We may take it as finally proved by Dr. Grierson and Professor Kuhn that the Mon-Khmer, Palaung, Wa, and Khasi languages are closely connected. In the section of the Monograph which deals with language some striking similarities between the languages of these tribes will be pointed out. We have not so far been able to discover social customs common to the Palaungs and the Khasis; this is probably due to the conversion of the Palaungs to Buddhism, the change in the religion of the people having possibly caused the abandonment of the primitive customs of the tribe. In a few years' time, if the progressive rate of conversions of Khasis to Christianity continues, probably the greater number of the Khasi social customs will have disappeared and others will have taken their place, so that it cannot be argued that because no manifest social customs can now be found common to the Khasis and the Palaungs, there is no connection between these two tribes. The strong linguistic affinity between these two peoples and the wild *Was* of Burma points to an intimate connection between all three in the past. As knowledge of the habits of the wild *Was* improves, it is quite possible that social customs of this tribe may be found to be held in common with the Khasis. With regard to social affinities it will be interesting to note the Palaung folk-tale of the origin of their Sawbwa, which is reproduced in Sir George Scott's Upper Burma Gazetteer. The Sawbwa, it is related, is descended from the Naga Princess Thusandi who lived in the *Nat* tank on the Mongok hills and who laid three eggs, from one of which was born the ancestor of the Palaung Sawbwa. Here we see how the Palaung regards the egg, and it is noteworthy that the Khasis lay great stress on its potency in divination for the purposes of religious sacrifices, and that at death it is placed on the stomach of the deceased and is afterwards broken at the funeral pyre. Amongst some of the tribes of the Malay Archipelago also the *Gaji-Guru* or medicine-man "can see from the yolk of an egg, broken whilst sacramentally counting from one to seven, from what illness a man is suffering and what has caused it." Here we have an almost exactly parallel case to the Khasi custom of egg-breaking.

In the Palaung folk-tale above referred to the importance of

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

considering. Some of the leading characteristics of the Lynngams will now be detailed. The Lynngams are by complexion swarthy, with features of Mongolian type. The men are of middle height and the women remarkably short, both sexes being not nearly so robust as the Khasis, a result due probably to climatic influences, for the Lynngams live in fever-haunted jungles. The men have very little hair about the face, although a scanty moustache is sometimes seen, the hairs in the centre being carefully plucked out, the result being two tufts on either side. Beards are never seen. The women are ill-favoured, and wear very little clothing. The men wear the sleeveless coat of the Khasi and Mikir pattern, called *phongmarong*, which is made of cotton dyed red, blue, and white. This custom may have been borrowed from the Khasis. They do not grow their own cotton, but obtain it from the plains. They make their own dyes, *changlong* (red) and *hur sai-iong* (black). A cotton cloth, barely enough for purposes of decency, is tied between the legs, the ends being allowed to hang down in front and behind. Sometimes an apron is worn in front. At the present day the men wear knitted woollen caps, generally black or red, of the Nongstoin pattern (a sort of fisherman's cap), but the elderly men and head-men wear turbans. The females wear a cotton cloth about eighteen inches broad round the loins, sometimes striped red and blue, but more often only dark blue. A blue or red cloth is thrown loosely across the shoulders by unmarried girls, but married women only wear the waist-cloth, like the Garos. A cloth is tied round the head by married women, sometimes, Garo fashion. The women wear quantities of blue beads as necklaces, like their Garo sisters. They obtain the beads from the Garo markets at the foot of the hills. Brass ear-rings are worn by both sexes; the women, like the Garos, load their ears to such an extent with brass rings as to distend the lobes greatly. Silver armlets are worn by the head-men only, or by those who possess the means to give a great feast to the villagers. This is the custom of the Garo *nokmas*, or head-men. Both sexes wear bracelets. The men also wear necklaces of beads. The rich wear necklaces of cornelian and another stone which is thought by the Lynngams to be valuable. A necklace of such stones is called *u'pieng blei* (god's necklace).

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

243 on from October to December. For millets the seed is sown in April-May and reaped about six months later. Maize is usually sown in 244 April-May and ripens in August - September. For potato, generally three crops are raised in the district ; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

245 For oranges and betelnut the orchards are cleared of weeds twice a year. Harvesting of orange takes place from October to January. Betelnut ripens at the beginning of the year and are collected between February and May.

241 **2.6.3 Agricultural Implements.**—The usual agricultural implements are a hoe, a sickle, three or four kinds of dras, a harrow, a crowbar which is used for the construction of irrigation channels, 'sierras' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Bhoi area and resembles the one in use in the plains of the State.

2. 6. 4. **General cultural practices.**—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

433 326 323 285 304 286 171 654 231 **2.7 Cottage Industries.**—Cottage Industries, it appears, have not found very great favour among the people of the district. A few families here and there manufacture iron implements, earthenware, pottery, baskets, mats and jewellery. In striking contrast with other districts weaving of cotton clothes is rare among the Khasis. The Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir Hills practice it only for their domestic consumption. At present, the Government is trying to popularise weaving in the district and this has been welcomed by the Khasis. Among other cottage industries production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

142 147 441 563 **2.8 The People.**—The Khasis and Jaintias are a short sturdy race distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour, they are free from any inhibition. Side by side with the Khasis live the Mikirs, Garos and Nepalis who form respectively 7.32 percent, 3.38 percent and 3·27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

241 433 461 **2.9 Occupation.**—The greater portion of the population of the district subsists on cultivation. More than 75 percent of the rural households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

535 women from the Wár country, wearing their picturesque dress, amongst whom was the wife of the Siem of Bohwal with her little daughter. The dance was a pretty sight, and I have [752] seldom seen such evidence of unaffected happiness as was exhibited by the people on this occasion. Dancing may be described as one of the characteristic features of Khasi life.

796 The Synteng *Beh-dieng-khlam* festival takes place annually 789 at Jowai and elsewhere in the Jaintia Hills in the deep water moon month (*u Jyllieu*, or June). *Khlam* is the Khasi word for plague or pestilence, and *beh-dieng* signifies to drive away with sticks. The festival may be described as follows:—The males rise betimes on the day fixed and beat the roof with sticks, calling upon the plague-demon to leave the house. Having done this, later on in the day they go down to the stream where the goddess "Aitan" dwells. Then poles of great length, which have been newly cut, are held across the stream. The people jump on the poles and try to break them; when they succeed in doing so, a great shout is given. After all these poles have been broken, a very large pole is fixed across the stream. The people then divide themselves into two parties, and contend for the possession of the tree. The contest, however, is a good-humoured one, and although many buffets are given and received, these are not regarded seriously, and there [291] are seldom any fights. Col. Bivar says the contending villagers, in their excitement, sometimes relapse into a state of almost complete nudity. The party which succeeds in obtaining possession of this post is supposed to gain health and prosperity [976] during the coming year. Col. Bivar remarks that the origin of this so-called ceremony is said to be that the god of thunder, "*u'lei pyrthat*," and Ka Aitan, the goddess of the stream, enjoined its performance. Many innovations, however, have crept in. People disguise themselves as giants and wild beasts, they also parade images of serpents, elephants, tigers, peacocks, [535] &c. Dancing is carried on with enthusiasm by the males, the [526] girls, clad in their best attire, remaining on-lookers. Before the meeting breaks up the males play a sort of game of hockey with wooden balls.

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

On the STONE MONUMENTS *of the* KHASI HILL TRIBES, *and on some of the Peculiar Rites and Customs of the People.* By Major H. H. GODWIN-AUSTEN, F.R.G.S., Deputy Superintendent Topographical Survey of India.

121 THE increasing interest that is taken at the present day in ethnology and the history of man in past and present ages, more particularly in the customs of semi-civilised races in distant quarters of the world as compared with the state of those races who dwelt in Europe in early historic times, has led me to put together the information I obtained regarding the people of the Khāsi Hill tracts. Their customs are peculiar, and the fact that they are among the very few who erect at the present day monolithic monuments, is alone of great interest.

This has not escaped the attention of different travellers, 122 officers of the Indian service and others who have visited that quarter of the Bengal Presidency, and from time to time papers have been published; these are scattered through a number of periodicals, and in no case is a complete record of these Hill people to be found.

Notices on the Garos and Khāsis, as well as many of the other tribes on the north-eastern frontier of Bengal, are generally very short, in some instances mislead, and in some cases do the peo- 152 ple, savages though they be, but little justice; in truth, there is very much to admire in these Hill people, they are in many ways, socially and physically, far above their Bengāli neighbours of the plains; intercourse with them is, in consequence, much pleasanter, easier, and has far greater interest; innate honesty and truth in their manners of dealing often crop out, more especially in villages well within the hills, where contact with the people of the plains is of rare occurrence.

101 I shall notice the best of these papers having reference to tribes inhabiting the range of hills running west to east, south of Assam, from the sharp southern bend of the Brahmaputra up to the Kopili and Diyung river, in long. 92 deg. 45 min., a length of some one hundred and sixty-five miles.

114 In the "Asiatic Researches," vol. iii, published so far back as 1792, is a very interesting paper on the Gāros, by Mr. John 113 Eliot; his travels, however, did not extend so far to the east as the Khāsias.

The Rev. A. B. Lish, a missionary of Cherra Poonjee, published an account of the Khāsias in the "Calcutta Christian Observer" for 1838, he gives an account of their mode of breaking eggs for omens, etc.

Neither in M'Cosh's "Topography of Assam," or in Robinson's "Assam," is any newer or better information afforded concerning

14:Roy I-5 (no date) 1938 AR7 Khasi AR7

602 join to the *a* woman in life through only one of the primary stages in the life essence when it was sustained through the umbilical cord.

Thus the connection of the *a* group is sustained to a much longer period and greater intensity in its life-formation to the *a* woman, than the *b* son.

Hence we have the double means of sustenace of life producing, through the umbilical cord and the breast, the single group *a*, while the single connection of life-formation through the umbilical cord produces a double a+b man-woman connection with the *b* son.

Thus he stands alone in the centre and he places his *jain na ka kpoh* (the kind which springs from the same womb), that is, those of (a) group (see tables) on one side, and he places his *kha* or those connected, or sprung of, the one umbilical cord, that is, those of (b) group on the other side. On the other side is *ka rynieng ka rngiew*, the 'stature', the person from which he also derives his. Then the Khasi calls the source (*thymmei*) from which he springs, *ko kur ka rngiew* (stature, person) *ki kha na uwei u sohpet* (those connected or sprung of one umbilical cord).

602 Thus the Khasi has his house of *ki kur ki jaid*
609 the relatives of his kind and species, and his world
156 of *ki kha ki man*, relatives of other people's kind and species with whom they are able to propagate human life.

This interesting Khasi fabric of human relationship between man and his mother and father,
[186] of the connection between a man and his fellow-

14: Roy I-5 (no date) 1938 AR7 Khasi AR7

human beings all over the four quarters of the globe (*ehi snieh ka pyrthei*) with whom, in the world, he can give in marriage and take in marriage, shows the nature which is believed to be innate in the Khasi, and his supposed power of moulding the world. His nature is to grow and to resist, to extend and spread out. It is against his idea of life to remain narrow or limited and resourceless. He is not to be made small or made an orphan, it will not do for him and his idea of the world to '*sah khlem khun kelem kti*,' stay without kind and species, without child, without issue. A couple would even seek to separate if there are no children of the union. His idea is, so to say, 'imperialistic,' to sow and spread out. As I wrote elsewhere, "A Khasi marries men and women of all races; to his Khasi parent the issues are all one and the same without any distinction of caste or creed or colour or possessions. The children are the 'khun kha' (*khun* = child, *kha* = born, i.e. children who are born through the union of a descendant of the parent with a descendant of another parent), and these children are unified into families and are assimilated, in the Khasi idea of life, while these groups of families are traced to their mother and are made to revolve on this ancestress as the pivot of their existence."

Thus the Khasi shows :—

One one side – mother
|
Son—mother
which is, – mother
|
the son of one's own – his kinswoman
On the other side also he shows – mother
|
Son – mother
which is – Father's mother
|
the son of others his kinswoman

14: Roy I-5 (no date) 1938 AR7 Khasi AR7

For the species to increase and continue he says, Here—

The mother to bear and give birth—	—	The son of others	The aunt *ka nia kha* (father's sister) } Ia, Ib

156 601 611

For the house to continue and the world to remain he says, Here—

The aunt *ka nia kha* (father's sister)	—	The son *u khun kha* (son of brother of ka nia kha)	The cousin *ka bakha* (daughter of *ka nia kha*) father's sister) } Ib, IIa

For the person (*rngiew*) to crystalise, and the stature (rynieng) to remain he says, Here—

father's mother (*ka kmie kha*) —		The son *u khun kha* (son of brother of *ka nia kha*, who is grandson of *ka kmie kha* (father's mother)	The cousin *ka para kha* (daughter of father's brother) } Ib, IIIa

The Khasi knows the 'sang' (*sacra*, sacred, that which is forbidden as sacred). He has experimented and therefore he says *ka sang iap* (*lit.*, that which is 'sacred' or forbidden or taboo unto death) in the case of those who committed incest in the same *jaid*, kind, species, that is, those of the *a* group. It is sacrilege. There is no greater punishment than for this sin,—a punishment so severe that the Khasi will not permit the bones of these transgressors to enter the family cairn. Similarly they regard as an act of sacrilege for children of brothers (*shi para kha*) to inter-marry. Thus the Khasi regards as 'sacred', that is, forbidden or tabooed, for those who are sprung of or connected through the same womb, and for those who are generated of and are suspended from or strung to one umbilical cord in origin, to marry. That is they regard as *sang* for the *a*+*b* man—woman group to marry the *b* son. [see Tables (1) & (2)].

684 582

14: Roy I-5 (no date) 1938 AR7 Khasi AR7

the husband. Whichever side is *jem ka rwiang* 582
(*lit.* whose person is less strong, less able to resist the evil) will suffer death. The word *rwiang* means more than literally 'fortune.' The word *rwiang* goes with *rngiew* and the two are coupled together as *ka Rngiew ka Rwiang*. *Rngiew* is the person, the man's 'ama'. '*Rwiang*' is the encircling power produced by that person, hence *jen ka rwiang* means the power encircling the mans person becoming easy of being conquered or subdued. (*Jem* = easy, pliable.)

In a word, the Khasi's idea of himself is that he 156 ●
stands in the middle of the world. We do not 601
find terms in the languages of peoples with the family system to express varieties of relationship to the extent that we have in the Khasi vocabulary. Some of the other languages content themselves with terms for father, mother, uncle, aunt, cousin. They have no words to differentiate the classificatory-descriptive system of terms showing relationship with mother, mother's elder and younger sistere (*mei, mei san, mei nah*); father and his elder and younger brothers (*kpa, kpa san, kap nah*) and father's brother's children (*para kha*), father's mother (*mei kha*), mother's mother (*mei rad,*) wife's brother (*kynum*), husband's brother (*kong*), and so on. We find in the Khasi sociology, departments of 156
social organization indicating the attitude towards 829
life which is peculiar to the Khasi. The terms are 601
not mere names but serve to show well-defined groups based on an idea of their special functions. As Dr. R. R. Marett says, "Exogamy, and everything 121

14:Roy I-5 (no date) 1938 AR7 Khasi AR7

121 else that we do is instinct with a *plus*; and for the student of religion or of human culture in any of its forms, to account for that *plus* is the sum and substance of his task.....Whereas, then, there is likelihood that any *a posteriori* reason existed for believing that in-breeding makes for sterility, if indeed it be true in fact at all, there might well have been an *a priori* conviction to much the same effect based simply on a fear that to tamper with the fountain-head of human vitality would somehow cause it to dry up." The Khasi stands in the world as exogamous in his rule of life, and he says '*sang bad byrsieh*', that is, endogamy is forbidden and if it should ever be committed it will render life defiled and corrupt. He says this out of the fear of the knowledge that any act of carelessness in the prohibited area of the source of human life and vitality, which is in the Khasi phrase '*long briw*' (*long* is to be or become, *briew* is man, i.e., to be or become man), will make that source of human life to dry up. So he says, 'duh I jaid I khong' (*duh*=is exterminated; *jaid*= kind, species; *khong*=root).

156 829 582 [885]

In refutation of such aspersions as that the Khasi has no rules of marriage, I shall quote the most sacred pronouncement the Khasi when two persons, the man and the woman, are initiated into that state. Calling upon the name of God the Khasi says—"*U Lei thaw briew man briw, u' Lei ne ka 'Lei synshar'*, (God who creates man and is the source of human life, God who keeps, controls, preserves), "*Hei ko Blei na jrong, Ko*

582 585 [539]

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

142 young are comely, of a buxom type, and, like the men, with highly-developed calves, the latter always being considered a beauty. The children are frequently remarkably pretty. Khasis carry very heavy burdens, it being the custom for the 482 cooly of the country to carry a maund, or 82 lbs. weight, or even more occasionally, on his back, the load being fixed by means of a cane band which is worn across the forehead; women carry almost as heavy loads as the men. The coolies, both male and female, commonly do the journey between Cherrapunji and Shillong, or between Shillong and Jowai, in one day, carrying the heavy loads above mentioned. Each of the above journeys is some thirty miles. They carry their great loads of rice and salt from Therria to Cherrapunji, an ascent of about 4,000 feet in some three to four miles, in the day. The Khasis are probably the best porters in the north of India, and have frequently been requisitioned for transport purposes on military expeditions.

157 The people are cheerful in disposition, and are light-
522 hearted by nature, and, unlike the plains people, seem to thoroughly appreciate a joke. It is pleasant to hear on the road down to Theriaghat from Cherrapunji, in the early morning the whole hillside resounding with the scraps of song and peals of laughter of the coolies, as they run nimbly down the short cuts on their way to market. The women are specially cheerful, and pass the time of day and bandy jokes with passers-
[461] by with quite an absence of reserve. The Khasis are certainly more industrious than the Assamese, are generally good-tempered, but are occasionally prone to sudden outbursts of
[533] anger, accompanied by violence. They are fond of music, and
[797] rapidly learn the hymn tunes which are taught them by the Welsh missionaries. Khasis are devoted to their offspring,
593 and the women make excellent nurses for European children,
463 frequently becoming much attached to their little charges. The people, like the Japanese, are fond of nature. A Khasi
517 loves a day out in the woods, where he thoroughly enjoys
824 himself. If he does not go out shooting or fishing, he is con-
825 tent to sit still and contemplate nature. He has a separate name for each of the commoner birds and flowers. He also has names for many butterflies and moths. These are traits which are not found usually in the people of India.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Shella

Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards 131
along the steep slope, looking down towards the Bengal plain. The climate
of this part of the hills is considered to be one of the worst in tropical India 132
for human habitation. The Bengal plain, though warmer than this area, is
considered more healthy. This border land is the zone of malaria, typhoid, 164
black fever, cholera, etc. None of the Bengalee peasants dare to live in such
an area. However, it is the most fertile for products such as betel-nuts, pan- 433
leaves, oranges, bananas and pineapples, and it also produces limestone. These
people seem to prefer to settle in this zone and to enjoy its prosperity, at the 164
expense of human lives: every year, especially between March and September,
the inhabitants suffer from various fevers and dysentry and other diseaes, many
of the weaker facing death. 648

Before the Partition of India and Pakistan, the products of Shella were 177
carried down the Shella River to Sylhet, one of the biggest centres in East 178
Bengal, which brought unimaginable wealth to the Shella people. Their houses
were built by carpenters from Sylhet. The style and structure of these houses 434
were exceptionally elaborate for the Khasi. They purchased vast rice fields [439]
in the plain, which used to be cultivated by Bengalee and Garo labourers [342]
engaged by them. These Khasi do not themselves know how to cultivate
rice fields; they have always been managers or landowners. Their boys used [166]
to be sent to high schools and colleges in Sylhet. As a result of their trading [464]
with the Bengalee, many of them read and speak fluent Bengalee. There is [874]
no difference between their style of clothing and that of the Bengalee, though
the women maintain their traditional dress in the Shella style. [191]

They have thus been distinguished from the rest of the Khasi not only [291]
geographically, but also economically and culturally. Their personality also
differs sharply from the rest of the Khasi. They are very sociable, and quick, 157
a quality lacking among the Khasi of Sohkynduh and Kongton. They are
clever enough to deal with strangers. The upland Khasi say Shella people 184
are very cunning. This remark shows one side of these people. They had to 648
be cunning, since they traded with the Sylhet Bengalee who were said to be the
most cunning of their race. Their role in the trade and in the history of the 177
modernization of the Hills was considerable. For centuries they represented 178
intellectual Khasi owing to their contact with Hindu civilization, while the
Hills remained in darkness. They assumed an important role when the British [439]
established an administration in the Hills, and even up to now, many leading
Khasi originated from this area: for instance, Lati Hat, the first interpreter
of the British Headquarters at Cherrapunjee; Jeebon Roy, who was the first
Magistrate among the Khasi; Maham Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jeebon Roy); Nichols Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nichols Roy), Principal of the Gauhati University, etc.

Through constant cultural contact with Hindu, and encouraged by their 177
economic prosperity, the Shella Khasi, like the Jaintias, have been much
influenced by Hindu culture. However, this does not mean that the people 648
of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, 771
and some ceremonial elements were borrowed from the Hindu, most of the 795

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

144 'ETHNOLOGY.—In order to determine the ethnological position of the Khásiás, we need dwell upon a few only of their physical characteristics, viz. those which are held to indicate that type of the human family, the Mongolian, to which they undoubtedly belong. A detailed description of their physiognomy would embrace forms and characters by no means common even to tribes occupying the hills in close proximity to them, much less referable to all branches of the Mongolian stock. These differences in detail, which may be attributed mainly to local influences, render it extremely difficult, if not absolutely impossible, to trace out the exact relation which these mountain tribes bear to each other. But the Mongolian, or to use a more comprehensive term, the Turanian, physiognomy is unmistakeable in them all—Khásiás, Jáintiás, Gáros, Míkírs, Nágás, Manipuris, etc. The chief points may be briefly stated as follows:—
142 Colour tawny or yellow, though a darker hue is not entirely
[141] unknown; nose somewhat depressed, with a peculiar conformation
[302] towards the forehead at the glabellum, which is very flat and broad; face broad, flat, and squarish, with high and rounded cheek-bones; skull globular rather than square; eyes middle-sized and black, with a yellow tinge in the eyeball; eyelids obliquely set, but less acutely than in the Chinese and other Indo-Chinese races; mouth large, with prominent though not very thick lips; hair black, thick, and worn long, the orthodox style being to tie it up in a knot at the back, varying little with sex; beard remarkably sparse, but the
141 moustache more abundant than the beard. The lower classes go
[826] bare-headed; stature low in the majority of cases; constitution strong and robust; limbs thick, short, and stout; trunk long in proportion and very broad at the waist; calves over-developed, but this is considered an element of beauty, more especially in the women, who, on the average, are fairer and handsomer than the men; carriage ungraceful.

157 'SOCIAL AND MORAL QUALITIES.—Disposition very affable, gentle, and cheerful; rather industrious, but devoid of ingenuity and mechanical skill. In the industrial arts, such as masonry, carpentry,
291 and agriculture, they are amenable to training. Dress amongst the lower classes is confined to a fringed jacket rudely woven of hemp, extending down as far as the thighs, and leaving the arms bare, together with a scanty covering for the loins. The more respectable classes wear a turban of coarse cotton or silk for a head-dress, and a sheet of silk thrown loosely over the shoulders, together with a long

14:Roy I-5 (no date) 1938 AR7 Khasi AR7

156
601
611

In their midst the Khasi places himself always as the son of the world, thus—

Table (3)

20: Hunter G-4 (no date) 1897 AR 7 Khasi AR 7

731 pre-eminently filthy villages on the Cherrá Pónji plateau the epidemic appears to have found a fitting home, for it stayed among them for a period of nine weeks and a half. The civil surgeon reports the deaths at Cherrá Pónji and the surrounding villages to have amounted to about 175 out of a total of 230 cases. During the year 1876-77 hooping-cough and small-pox were prevalent in an epidemic form. In the Jáintiá Hills small-pox is stated to have caused 47 deaths, chiefly during the months of June, July, and August. Some fatal cases of hooping-cough occurred among the Khási children in the village of Mákhar, near Shillong. The only two cases of cholera reported were in the Jáintiá Hills.

- 16 VITAL STATISTICS.—A general system of registration is not
{659} attempted throughout the Khási and Jáintiá Hills District. Statistics
{648} of births and deaths are only collected among the inhabitants of the Stations of Shillong and Cherrá Pónji, and in the selected area in the vicinity of Jowái, which comprises the following seven villages:—Jowái, Nongkah, Mariang, Mynsan, Amwí, Rálíang, and Shompíng. This selected area has a population of 11,924. Each village forms a distinctly-circumscribed community, in which the statistics are readily ascertained and reported by the *dalói* or head-man. The returns may be regarded as extremely close to the truth, both for births and deaths; and they thus furnish an approximate statement of the health of the entire Hills. In 1874 the total number of deaths in the selected area was 331, showing a death rate of 28 per thousand; the number of births was 431, or 34·4 per thousand. The total population of all the places in which vital statistics are collected is 15,458 persons, among whom 428 deaths were recorded in 1874, showing a death-rate of 27·6 per thousand, as compared with 27·3 per thousand in the preceding year. The deaths were thus distributed—24 from cholera, 256 from fever, 38 from bowel complaints, 2 from snake-bite or wild beasts, and 68 from all other causes. The mortality from fevers was the highest recorded throughout the entire Province. On this the civil surgeon observes:—"There are few local sources of malaria in the Hills. Many of the deaths from fever were probably due to typhoid, induced by the use of impure water and by the filthy state in which the
312 people live. There is no attempt at conservancy in a Khási village.
364 In Jowái, a good specimen of the class, the lanes and pathways are
164 strewn with excrement and house refuse. Drinking water is got from wells in the heart of the village, fed by the drainage of the

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

It may perhaps be ascribed to the pre-eminence
accorded by the Khasis to the female sex that successive 162
censuses have shown that the women of this race
considerably exceed the men in number. According
to the census of 1901, there are 1,118 females to every
1,000 male Khasis. This excess, however, is surpassed
by that of the Lushais, 1,191 to 1,000, and it may
possibly be due to the greater risks to life encountered
by the men, who venture far into the plains as traders
and porters, while the women stay at home. Habits of 165
intemperance, which are confined to the male sex, may
also explain a greater mortality among them.

It would be interesting to investigate the effect 161
on reproduction of the system of matriarchy which 163
governs Khasi family life. The increase of the race is
very slow. In the census of 1891 there were enumerated
only 117 children under 5 to every hundred married
women between 15 and 40, and in 1901 this number fell
to 108. It has been suggested that the independence
of the wife, and the facilities which exist for divorce,
lead to restrictions upon child-bearing, and thus keep
the population stationary. The question might with
advantage be examined at the census of 1911.

The next characteristic of the Khasis which marks 787
them out for special notice is their method of divination 782
for ascertaining the causes of misfortune and the
remedies to be applied. All forms of animistic religion
make it their chief business to avert the wrath of the
gods, to which calamities of all kinds—sickness, storm,
murrain, loss of harvest—are ascribed, by some kind of
propitiation; and in this the Khasis are not singular.
But it is somewhat surprising to find among them the 787
identical method of *extispicium* which was in use among 171
the Romans, as well as an analogous development in
the shape of egg-breaking, fully described by Major
Gurdon (p. 221), which seems to have been known to

782 and can now also appear at the public state and
793 community sacrifices when any basis of relationship justifies it.

This ceremonial way of introducing lyngdohs is still the custom especially in the kingdoms of Kyrim and Nongkrem.

The number of active, official lyngdohs varies according to the region. A kingdom has at least one official lyngdoh. [Fig. 4. Egg throwing: Throwing of the egg.] [Fig. 5. Egg throwing: Investigation] But the kingdom
[796] of Nongkrem, for example, has six official lyngdohs, who together with the king and with other lyngdohs from neighboring villages annually offer the great state sacrifice. (8) Even

8. P. Dr. Becker, S.D.S., "Die Nongkrempuja in den Khasibergen" [The Nongkrem Puja in the Khasi; Mountains], Anthropos, Vol. 4, (1909), p. 898.

villages often have their own official lyngdohs.

For the services which they perform for the people by offering sacrifices, they do not receive money or a present of money. Usually their trouble is rewarded by natural products, such as a hen, a bottle of rice liquor or even, though more rarely, by a pig. Obviously they always have the right to participate in the sacrificial meal.

2. The Sacrifices.

a) State Sacrifices.

161 According to the report of the last census
722 the tribe of Khasi numbers about 200,000 people.
621 (9) These are not unified under one ruler, but

9. P. Dr. C. Becker, S.D.S. Im

161

Stromtal des Brahmaputra [In the Valley of the Brahmaputra], (Aachen: Xaverius Publishing House, 1923) p. 293.

782 621 are divided into 10 kingdoms and 15 small states (communities). In each of these kingdoms and communities an official state sacrifice is of-
782 fered each year. The smaller state units offer
776 it to the u basa shnong or to the u phan u
796 kyrpad (the tutelary god of a village), the larger one to the u 'lei Shillong (the god who has commanded the sacrifice) [218]. The purpose of this large sacrifice is to thank the revered god for the country (kingdom or community) and to beg him to make its inhabitants
782 healthy and happy. This is shown by the prayers
796 spoken at these sacrifices, namely: "O god Shillong! for thee is this prayer, this sacrifice of goat, of hen, of kpu and rynsi (a kind of bread of rice meal or cornmeal with pounded sugar), of utensils of preparation, as thou hast given them to the royal lineage, so that once in every year Puja is celebrated in thy name, so that we may live happily, be healthy and increase, so that kings will arise, so that their honor and that of the kingdom will grow and increase and the children of the kingdom will spread out to increase thy name and thy honor." (10)

10. P. Dr. C. Becker, S.D.S., "Die Nongkrempuja in den Khasibergen" [The Nongkrem Puja in the Khasi Mountains], Anthropos Vol. 4, 1909, p. 901.

In another prayer they say: "O lord, thou who hast created heaven and earth, thou hast placed a king that we may be children of his

The Market Life of the Khasi
(With ten original photographs by the author)
by P.F. Stegmiller, S.D.S., Munich

[101] The mountains in the northeast corner of India which lie between the valleys of the Brahmaputra and the Barak are inhabited by a [161] tribe, the Khasi, numbering about 200,000 people. Although they rarely cross the borders of their homeland and live almost cut off from their [484] neighbors, they have an active traffic amongst themselves and travel a lot. This traveling is determined by the very distinct market life of the Khasi. It is truly the pulse beat of the people. The rest of their homelife, their activities, and their private, public, and religious life. (1) Time is divided accord-

1. P.F. Stegmiller, "Aus dem religiösen Leben der Khasi" [The Religion Life of the Khasi], Anthropos, 1921-1922, pp. 425 ff.

ing to the market; the market replaces the daily newspaper and the information service; the market unites the individual villages; the market offers a living to many and for many has become a source of wealth.

443 How much the Khasi depend on a thriving
782 market may be seen in their prayers which are spoken every year at the great state sacrifices in honor of the god Shillong by the sacrificer (lyngdoh) presenting the service: "O god, Shillong! Thou who receivest this prayer, this sacrifice of goats, of fowl, of kpu and rynsi (a kind of bread of rice flour or cornmeal with pounded sugar), of utensils used in the preparation, as thou has given them to the royal

CHAPTER I

INTRODUCTION

The homeland of the Khasi is the hilly country situated in the northeast of India and known at present as the District of United Khasi and Jaintia Hills, under the Assam State Government. The area is bounded by the plains of the Kamrup and the Nowgong Districts to the north, by the Cachar Hills and East Pakistan (District of Sylhet) to the south, and by the United Mikir and North Cachar Hills Districts to the east. The Khasi and Jaintia Hills are divided politically into two subdivisions, with headquarters at Shillong for the Khasi Hills, and at Jowai for the Jaintia Hills, respectively. The peoples of both subdivisions are called "Khasi" in a broad sense, and are distinctly marked off from other neighbouring tribes and peoples by language and social structure. The population of the Khasi in the District is 363,599 *(Census of India, 1951, Assam)*. Their language belongs to one of the Mon group of the Austro-Asiatic family to which the Munda in central India also belongs.[1]

Though all Khasis share fundamentally the same language and social structure, their culture, dialects, economy, social usage, and political organization vary greatly, owing to the ecological and politico-historical differences among them. The United Khasi and Jaintia Hills are much higher than the neighbouring Garo Hills. The plateau of the Khasi Hills ranges from about 5,000 feet to 6,000 feet, of which

1. The *Census of India, 1951, Assam*, makes the following remarks on their language: "Their nearest kinsmen have been discovered to be the Palaungs, a tribe inhabiting one of the Shan States to the northeast of Mandalay on the middle Salween. Later the relationship of the Khasi language has been traced not only to the Mon-Khmer language, but also to the Nicobarese and several dialects spoken by some tribes in the Malay Peninsula. In Assam, this special form of speech is only found in the Khasi and Jaintias while nearly all the other primitive languages with which it is surrounded belong to the great Bodo family. The Khasi language is the only member of the Mon-Khmer family which possesses a grammatical gender distinguishing all nouns as masculine and feminine, and here also the feminine nouns immensely preponderate."

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

[Shella]

wife who lives with him. The Khasi woman lives with her mother. Some say the Khasi woman is his second wife, other say their marriage is not recognized by the public. 563

Actually, owing to the bad climate, very few non-Khasi live in this area. Besides the two non-Khasi just mentioned, there were a Bengalee tax collector and an Assamese Forest Officer, both of whom lived at Shella Bazaar. Bengalee villages are situated about five miles south of Shella. Except in the bazaar, Bengalee and Khasi have no social contact with each other, and intermarriages have been rare.

However, it is obvious that in the past the Khasi must have had many cases of intermarriage with Bengalee. Among the Khasi, there is a clan called 'Dkhar.' The term 'Dkhar' is also used for the peoples of the plains: Bengalee are called 'Dkhar' by the Khasi. They say that the Dkhar clan originated in Bengalee girls who married Khasi men and who went to live in the Hills. It is said that in older days, the Khasi often raided the Sylhet plain and kidnapped Bengalee girls as well as goods. In Bengalee records of Sylhet, Khasi appear as 'bloody Khasi.' Khasi old men say that in order to increase their population they did sometimes kidnap Bengalee girls, but that they treated these girls very nicely and kindly, no differently from their own people. Since they follow the matrilineal system, they decided to name their descendants 'Dkhar.' It is said that all the present Dkhar people are descendants of such marriages. The Dkhar are found more on the southern slopes of the Khasi Hills i.e. among the Wars. 101 563

It seems there were many reasons for the descendants by marriage between the Khasi and the Bengalee to become Khasi. First of all, it is said that in the olden days the Khasi wanted to increase the population by such marriages. At the same time, a Bengalee who married a Khasi became an outcast from his or her own society owing to the caste system, and this inevitably made them Khasi. Secondly, the Khasi were primarily grouped into the *iing*, and they considered the marriage relation as of secondary importance. Hence it was rather difficult to remove by marriage a Khasi man or woman from their native place. Thirdly, Khasi could hardly live in the plain where no betel-nut or pan-leaf gardens were available; they could not engage in rice cultivation in the plain, as the technique is entirely different from the cultivation of betel-nut or pan-leaf. Moreover, they said they could not stand the heat in the plain. Therefore, the orientation of intermarriages was always towards the Khasi community: the Khasi brought outsiders to their own land; they did not themselves leave.

Such a marked tendency on the part of the Khasi to remain attached to their own homeland, is in no way contradictory with the phenomena of their migration to places outside the Khasi Hills, owing to the exploitation of their homeland and to the increase in population. The formation of Jatinga represents such an instance; there are also the cases of modern Khasi women from sophisticated urban areas, who easily leave their homeland, after marriage with a non-Khasi; this also appears in the following data on Jatinga. 161 167 [563]

JATINGA

Jatinga is a Khasi village situated in the North Cachar Hills, three miles west from Haflong, the headquarters of the North Cachar Hills. The number of households was about sixty in February 1956. Their economy depends on the pan-leaf, orange and pineapple gardens, similar to that of the Shella people. 131 621 433

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

[Jatinga]

three miles away from Jatinga. As one may expect in such a situation, quite a number of intermarriages with these peoples appear in my census of Jatinga. The resultant of these intermarriages was that when the couple and their children lived in Jatinga, they were considered to have become Khasi; otherwise they were held to be non-Khasi, whether the spouse was man or woman. This orientation of social recognition of the result of intermarriage was generally seen among Khasi in such situations, not only in the case of Jatinga. 563 621

The following are extracts of intermarriages from my genealogical table of Jatinga people. 563 591 621

A. Cases of intermarriages in which the descendants became Khasi.

1. A woman of the Dome clan married a Kuki man. All members of the present Dome clan at Jatinga are their descendants.
2. A woman of the Rymbai clan married a Kuki man as her second marriage. Their descendants are Rymbai.
3. A man of the Suchiang clan married a Mikir woman, and lived in Jatinga. They had one daughter who married a man of the Hua clan of Jatinga. They named this woman's line 'Shadap' as one of the Khasi clans. Later this Mikir woman's sister's daughter married a man of Rupsi-Lati, and their descendants were also named 'Shadap' by the villagers. Thus Shadap clan was created by a Mikir woman who married a Khasi man of Jatinga.
4. A Khasi man married a Lushai woman and lived at Aijal, the headquarters of the Lushai Hills. They said he became Lushai. Later a man of the Pajat clan of Jatinga married his daughter from Aijal. This couple lives at Jatinga and has several children. The villagers said they have to give them a new clan name. It is under consideration.

B. Cases of intermarriages leading to the emigration of Jatinga inhabitants.

5. A man of Jatinga married a woman of Zemi-Naga as his second marriage and lives at his wife's village.
6. A woman (the daughter of the woman of Rymbai, who married a Kuki: A-2) married a Moslem man and lives at Haflong.
7. A woman of Rymbai married a Panjabee and lives at Shillong. This woman is (B-6)'s mother's sister's daughter.
8. A woman of Siangshai clan married an Assamese and lives at Gauhati.
9. A woman of Rupsi-Tah married an Anglo-Indian and has gone to the United Provinces.
10. A woman of Jatinga married a man of Zemi-Naga and went to his village.
11. A woman of Jatinga married a man of Cacharee and lived at his village some time, but she came back to Jatinga after divorcing him.

A cases belong to the earlier period when Jatinga had a shortage of population, while *B* cases, except 10 and 11, are found among the present younger generation. The population, which had increased rapidly in the last twenty years with economic prosperity, is suffering from the recent economic depression caused by the Partition as well as from the great damages done to their orange gardens and pan-leaf gardens by tree diseases. Moreover they have an unbalanced rate of birth according to sex: females are more numerous than males. Therefore, many daughters marry out as shown in the cases of *B*. The above-cited cases are only concerned with intermarriages with non-Khasi, but there are still other women who married Khasi men and who reside outside Jatinga, as for example, at Haflong and Shillong. [161]

In the village there are still many unmarried girls without suitable spouses. In the olden days, it was less difficult to marry neighbouring tribal peoples, 178 563 621

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

workers and they were few in number.[1] They were particularly employed for such work as the clearing of jungle for new pan gardens in summer. 245 464

In the orange season (December to February) the number of workers increased and they were paid more: Rs. 1/8 were paid[2] for one load (one person carrying 80 pounds of oranges, from an orange garden to the railway station—about two miles). Usually a worker made three to five trips a day. Many workers from Jaintia used to come for this particular season. 245 464 465

Semi-permanent workers were engaged for wet rice fields. They were usually Hindu cultivators: since these Khasi and other tribes do not know the technique of wet cultivation, plains people like the Biharee immigrants were engaged. These workers were provided with servants' quarters where they lived with their wives and children. However, very few Jatinga households possessed rice fields. 243 464

The economic prosperity of Jatinga reached its climax during the period from 1934 to 1940. Since 1942, the orange production has been decreasing. In 1945, a serious disease attacked the orange gardens as well as the pan-leaf gardens. Besides, by depriving Jatinga, as it had Shella, of their most important markets, Dacca and Sylhet, the Partition of India and Pakistan in 1947 caused a serious economic depression in the whole region. On the other hand, because of the past prosperity, the population has rapidly increased during the last ten years. The serious economic condition of Jatinga is illustrated in the petition which was submitted by the Jatinga people when the Governor of Assam visited those areas in January 1956. It runs thus: 245 434 731 161 458

"Since the last ten years or so, with the increase of population in the village and with the loss of fertility of the soil, the people were faced with economic depression. At present they are facing acute shortage of land they have also no scope to adopt other forms of cultivation like jhuming and wet rice cultivation, etc. Moreover, there has been successive attack of Bright's disease which destroyed and wiped out all the orange and pan gardens. And as such, majority of the families have to depend for their livelihood on daily wages. . . ."

It is indeed a serious situation for them, because the Khasi do not produce staple foods, such as rice; their economy is completely dependent on the trade of their products by which they purchase their main provisions, clothes, etc. Other peoples round Jatinga, being jhum cultivators, can at least get rice and cotton: the minimum requirements, staple foods and clothing are available even in the worst conditions, so that they can at least maintain themselves though the standard of living is low. As I stated before, a few households in Jatinga possessed rice fields, but the majority had none. Recently they rented some plots of jhum field for rice cultivation from Zemi-Naga of neighbouring villages.[3] However, its yield was but a small percentage of their consumption. A few 182 434 [433] [243]

1. If they had worked in the gardens of Jatinga, they might have got more profit than from their own jhum fields. For one day's labour, they got Ans. 8/. For one month, they could earn Rs. 15 with which they could buy about 4-5 maunds of rice (one maunds paddy cost Rs. 3-4). For one year it became 50 maunds, which was impossible to produce in a jhum field by a single person's labour. [435]

2. These rates, including the figures of note 1, apply to 1956.

3. Jatinga villagers told me that Zemi-Naga were kind enough to lend them their field for a negligible rent, though they had not enough for themselves. Zemi-Naga said that they owed much to Jatinga in the past, so that now they sympathised with the condition of Jatinga, and offered some parts of their jhum field. [427] [628]

16: McCormack E-4,5 (1956-1958) 1964
[P. 106 B] AR7 Khasi AR7

1903-28: 2, Bareh 1962.] **Demography.** According to the 1951 census of India, the United Khasi–Jaintia Hills District contained 221,982 Khasis and 67,532 Syntengs, Pnars, and Jaintias (India [Republic] 1952-57). These figures, together with those for Khasis enumerated in Cachar (4,005), Mikir and North Cachar Hills (467), Lakhimpur (287), Sibsagar (276), and Darrang (211) districts, and those for Syntengs enumerated in Mikir and North Cachar District (464), yield a total of 295,224 Khasis. **History and cultural relations.** Khasis believe that they had supernatural origin in Khasi Hills (see Gait 1926: 260 for historical evidence, and Rafy 1920: 8-9 for myth, but see also Costa 1958, 1960; Gurdon 1907: 10-11; and Chatterji 1953: 12). Khasi tradition also states that in early times they moved gradually from east to west, from Jaintia toward Khasi Hills, in the practice of swidden agriculture (Gatphoh 1947: 97-98). The salient fact of known Khasi history, which begins generally in the mid-sixteenth century A.D. when there already existed the present-day 25 native Khasi chiefdoms, is the distinctive line of development followed by the separate kingdom of Jaintia. To the north, Jaintia was successively tributary, in part or in whole, to the Kachari kingdom (ca. 1230 A.D.), the Koch kingdom (strongest ca. 1560 A.D.), and the Ahom kingdom (strongest ca. 1700 A.D.) (Shakespear 1914: Map I). To the south, about 1500 A.D., Jaintia extended its rule over a tract of Sylhet, which was populated by Hindus and Muslims, and saw its kings fall thereafter under Brahman influence. In the early 1800s, Jaintia became involved in the fratricidal strife then prevalent in the ruling family of Manipur. In 1835, after the Jaintia king ignored British warnings not to seize British subjects for human sacrifice, Jaintia was punished by the British annexation of the Jaintia parganas in Sylhet. The Jaintia king then voluntarily turned over to the British the hills area of his domain, so that the whole of Jaintia became part of British India and, in 1860, came to be taxed as such, although the Jaintias were otherwise allowed to maintain their traditional system of village government. • By contrast, the remaining Khasi states had few formal external relations until British times. Khasis raided and traded in both the Brahmaputra and Sylhet valleys, but were basically turned inward on their own hills, where warfare between villages and between the states was apparently common. Khasis came into indirect relation with the British in 1765, when Sylhet and its markets became part of British India. In the 1790s, stepped-up Khasi raids into Sylhet caused the British to throw up a deterring line of forts along the foothills. Later, it became necessary to place an embargo on Khasi products in the Sylhet markets. In 1827, the British penetrated into western Khasi Hills by negotiating with the Khasi chief of Nongkhlaw **State** to build a road through his territory, linking the recently annexed Brahmaputra valley with Calcutta. For three decades

161 563 173 [113] [113] 175 619 648 175 619 648 726 [439] [437]

16: McCormack E-4,5 (1956-1958) 1964
[P 110B] AR7 Khasi AR7

another. In other words, a state is not a fixed territorial entity. In the early twentieth century, the most populous of the 25 chiefdoms, Khyrim, contained 36,833 persons occupying 7,859 houses in 372 villages, and the least populous, Nonglwai, contained 246 persons occupying 53 houses in 3 villages. Fifteen of the chiefdoms were headed by a *syiem* (chief), three by a *lyngdoh* (priest), six by a sirdar, and one by a *wahadadar*. These leaders all had executive and judicial functions, but a chief's authority was limited in that he had to obtain the approval of his executive council before acting. The other leaders were subject to a similar limitation. A chief maintained a small police force. His major sources of revenue were market tolls, fines, and, more recently, income from licenses to distill rice whisky. Succession to a ruling role in the larger states traditionally involved election by members of a lineage that had a hereditary right to elect, from among members of a lineage that had the hereditary right to rule. In British times, the elective basis was broadened, differentially in the various states, even to the point of popular elections. [Cf. Aitchison 1931; Lyngdoh 1952.] **Social stratification.** The three classes of lineage are the nobles, the commoners, and the slaves or servants. This stratification applies only to the recruitment to office in the native-state system, for there is no hypergamy, and in a village assembly everyone has equal voice. The noble lineages have the hereditary right to fill from among their male members roles such as village or state priest, councilor to a chief, or elector of a chief. The few lineages which today are remembered as slave or servant lineages had the inherited obligation to render special services to a chief's household. There is no Khasi term for "commoner." Every lineage other than a noble or a slave lineage is a commoner lineage, and the commoner lineages are in the majority. **Warfare.** Warfare was suppressed by the British, and little is known for certain about its traditional forms. The tactics which confronted the British were the ambush and the guerrilla raid. Traditional goals included taking heads from other Khasis and capturing women from the valleys.

RELIGION. **Major and indigenous religions.** A Welsh Calvinistic Methodist missionary penetrated into Cherrapunji in 1832, and the work that he began continues to this day. His society, which has since become the Welsh Presbyterian Foreign Mission, introduced writing, village primary schools, a high school, a theological seminary, and a hospital. Competing missionaries followed, and by 1914 some Shillong Khasis were puzzling over the tenets not only of traditional Hinduism and Islam but also of the Buddhists, Brahmo Samaj, Arya Samaj, and Unitarians (Roy 1914). By the 1920s, missionaries of the Church of God and the Seventh Day Adventists were

CHAPTER III

The Border Area

121 131 **3. 1 Definition of Border Area.**—The term 'border areas' although very frequently used does not refer to any well demarcated area. It was, therefore, decided after a joint discussion between the Director of Statistics with the Deputy Commissioner of the district and Subdivisional Officer, Jowai, that area within 20 miles of the Indo-Pak border line would be considered as the 'border area' for the purpose of the present survey. The list of the villages falling in this area was supplied by the Deputy Commissioner and the Subdivisional Officer.

3. 2 Condition of the Border Area before partition.—The border area under review thus comprised of the southern slopes of the Khasi and Jaintia Hills and a narrow strip of plains adjoining the southern slopes running along the Pakistan border. The area extends laterally over a length of about 120 miles, roughly from Maheskhola on the west to Sonapur on the east thus covering an area of 2,400 sq. miles approximately, comprising of 454 villages inhabited by population of 74 thousands. [161]

245 311 Barring the barren and rocky top plateaus the slopes are utilised or the production of valuable cash crops on intensive scale. These slopes provide suitable soil and climate for the production crops like arecanut, tezpatta, betel-leaf, oranges; pineapples and other fruits. On account of rich yields which such plantations give to the cultivators these slopes were, more densely inhabited and intensively cultivated than would appear possible from the topography of the area. Even the most inaccessible tracts in the slopes has been converted into rich orchards, wherefrom the produce was carried by headloads over steep gradients for several miles. Due to steep gradients little other use, except some jhuming here and there, could be made of this area. [482]

439 Because of the very topography, this land had its natural connections with Sylhet district now forming part of East Pakistan. From time immemorial the area had a flourishing trade with Sylhet district. It was a two-way traffic. The cash crops found eager buyers in the people of Sylhet, from whom in turn the people in the border area obtained supplies of rice, fish, vegetables and other necessities of daily life. Thus in prepartition days they enjoyed a very prosperous and settled economy. The rich buildings in the border area villages which are now lottering away, bear eloquent testimony to the past prosperity of the border economy.

439 458 648 With the partition of the country in 1947, trade with the plains of Sylhet, now forming part of East Pakistan, was restricted. As a result the whole economy of this region was completely shattered and the countryside which once hummed with activity and abundance was over-shadowed with unemployment, poverty and despair. All the cash crops-the mainstay of the border people lost the market in East Pakistan. for want of communication facilities the produce could not be

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

CHAPTER V

Population and Occupation

The following table shows the number of families and population of the sample villages in the different village groups. 162* 161 125 621

TABLE C-1

	Border area	Project area	General area
1	2	3	4
No. of villages	10	8	10
No. of families	1,086	647	184
No. of persons	3,674	2,965	902
Average no. of families per village.	101	81	18
Average no. of persons per village.	367·4	370·6	90·2
Average no. of persons per family.	3·6	4·6	4·9

The population in the first two groups of villages is much more than in the third group because important villages were intentionally selected from border and project areas. The figures may not truely reflect the difference in the average size of villages in these areas.

The population in the selected villages were compared with the 1951 census figures. But it was found that the two sets of figures are not strictly comparable due to changes in the names and boundaries of the villages and emigrations. A note on this study is included in the appendix. [128]

*162 125 • 161 621

5.2: The following table shows the classification of population by age and sex in the three areas:—

Age and Sex Composition of Population

Age Group	Border area			Project area			General area		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Below 5 yrs.	293	328	621 (16·90)	299	295	594 (20·03)	77	87	164 (18·18)
2. 5 to below 15 yrs.	426	459	885 (24·09)	380	373	753 (25·40)	127	112	239 (26·50)
3. 15 to below 65 yrs.	1025	1077	2102 (57·21)	722	862	1584 (53·42)	258	236	494 (54·76)
4. 65 yrs. & above	26	40	66 (1·80)	16	18	34 (1·15)	3	2	5 (0·56)
Total	1770	1904	3674 (100·00)	1417	1548	2965 (100·00)	465	437	902 (100·00)
No. of females per 1,000 males	..	1076	..	..	..	1092	..	..	940

It is seen that the population under 15 years of age in the border area, project area and general area were respectively 41 per cent, 45 per cent and 45 per cent of the total population in these areas, while that under age group 'between 15 to 65 years', constituted respectively 57 per cent, 53 per cents 55 per cent of the population in the three areas.

It is evident that population of females was as a whole greater than that of male in border area and project area and less in general area. The number of females per 1,000 males in border area, project area and general area were respectively 1,076, 1,092 and 940 against the 1951 census figure of 983 females per 1,000 males in the rural areas of the district of United K-J. Hills.

5.3: The following table shows the classification of population by religion.

TABLE C-3

*162 779

Classification of Population by Religion

Area	Tribal religion	Christianity	Hinduism	Other religion	Total
(1)	(2)	(3)	(4)	(5)	(6)
1. Border area	1766 (48·07)	1410 (38·38)	483 (13·15)	15 (0.41)	3674 (100·00)
2. Project area	811 (27·35)	2013 (67.89)	141 (4.76)	0.00	2965 (100·00)
3. General area	300 (34·26)	571 (63·30)	22 (2·44)	0.00	902 (100·00)

[433 563] Population following Hinduism and other religion in the border area comprises mostly of displaced persons from East Pakistan following trade and business as their means of livelihood, while those in the general and project areas are mainly the Nepalies who are generally engaged in cattle rearing and agriculture.

CHAPTER—X

Summary of main findings

125 10.1. Twenty-eight villages were selected for the purpose of the survey. Out of the 28 villages selected, 10 from Border area and 8 from Project area were selected purposively while the remaining 10 were selected at random from the entire district which is referred hereafter as general area.

166 Migration from big villages was rare but some migration was reported in respect of small villages.

164 743 871 489 482 Occurrence of Malaria, influenza and dysentery is a regular phenomenon in the area. Medical facilities were not found satisfactory and as much as 78 per cent of the villages have no dispensary within a radius of five miles. In regard to education, the facilities cannot also be said to be unsatisfactory for more than 60 per cent of the villages have a Lower Primary School. Transport facilities were not satisfactory and as much as 86 per cent of the villages still depend upon primitive mode of transport, namely head load. Correlated with outmoded form of transport, is the prevalence of unduly high cost of transport.

*162 161 10.2. The number of the families covered by the survey was 1006 in the Border area, and 647 in the Project area and 184 in the General area. The average size of a village in the respective area is 100·6, 80·9 and 18·4 families. In the Border and Project areas females out number males being respectively 1076 and 1092 females per 1,000 males as against 940 females per 1,000 males in the general area 212 Literacy is as high as 34 per cent in the border area and 31 per cen [562] in the Project area but as low as 17 per cent in the general area In all the areas literacy among females is very low.

*162 464 The working population (earners and earning dependents) is as high as 55 per cent in the Border area, 54 per cent in the Project area and 63 per cent in the general area. While there were no cases of unemployment in the Project and General areas, 53 persons were reported unemployed from border area.

241 *162 463 10.3. 51 per cent of the families in Border area are wholly agricultural, 35 per cent partly agricultural and 14 per cent independent o agriculture. The corresponding figures for the Project area are 61, 31 and 8 per cent respectively while for the General area they are 70 per cent, 29 per cent, 1 per cent respectively.

Predominantly agricultural families constitute 67, 76 and 90 per cent of the families in Border, Project and General areas respectively.

*162 423 10.4. 31 per cent of the families in Border area, 29 per cent in Project area and 10 per cent in General area were absolutely without any land while 25 per cent, 39 per cent and 24 per cent of the families in the respective areas possessed small holding ranging from 0·24 to 2·30 acres representing 11,24 and 26 per cent of the total holding area in the respective areas. 36 per cent of the families in Border and Project areas and 41 in General area possessed medium sized holding (3 to less than 10 acres)

[P. 203]

STATISTICAL ACCOUNT

OF THE

KHASI AND JAINTIA HILLS.

THE DISTRICT OF THE KHASI AND JAINTIA HILLS, called by the inhabitants Ka Ri Khási and Ka Ri Synteng, is situated between 26° 9′ 30″ and 25° 8′ 28″ north latitude, and between 91° 9′ 0″ and 92° 51′ 30″ east longitude. It contains an approximate area of 6157 square miles, and a population, according to the Census of 1872, of 141,838 souls. The principal town and Civil Station, which is also the headquarters of the Chief Commissioner of Assam, is Shillong, situated in 25° 32′ 39″ north latitude and 91° 55′ 32″ east longitude.

BOUNDARIES.—The Khási and Jáintiá Hills District is bounded on the north by the Districts of Kámrúp and Nowgong; on the east by Northern Cáchár, the Nágá Hills District, and the Kapili river; on the south by Sylhet District; and on the west by the Gáro Hills.

JURISDICTION.—The Khási and Jáintiá Hills constitute a Political District, removed from the jurisdiction of the ordinary Criminal, Civil, and Revenue Courts, and of the offices established under the General Regulations and Acts. The administration of the country is vested in the Chief Commissioner of Assam, the Deputy-Commissioner of the Khási and Jáintiá Hills and his Assistants, and the native Chiefs, who are variously styled Siems, Wáhadádárs, Sardárs, Dollois, Pathors, and Lyngdohs. Siem, or more properly Seim, is derived from the Khási word for 'soul, life;' Wáhadádár, from the Hindu term *uhdádár*, meaning an 'officer;' Lyngdoh strictly means a 'sacrificial soothsayer,' from the Khási *ong*, 'to speak,' and *doh*, 'flesh.' The District is divided into three portions, —namely, British possessions in the Khási Hills; petty dependent

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

public auction. The Assam rules, as revised in 1875-76, reserve to Government the right of pre-emption at the price of Rs. 600 (£60) in the case of every elephant captured between 6 feet and 7½ feet in height. For every elephant caught that is not purchased by Government, a royalty of Rs. 100 (£10) is payable within one month after capture. Certain methods of hunting are prohibited. 224 648 651

POPULATION.—Prior to 1872 no attempts had been made at a Census of the Khási and Jáintiá Hills, but in 1870 the Deputy-Commissioner approximately estimated the population at 118,925 souls. In 1872, at the time of the Bengal Census, operations were set on foot in these Hills, but on a less elaborate system than in Regulation Districts. In the Khási Hills, the Census of the various petty States was effected through the chiefs; in British territory in the Jáintiá Hills, the *dollois* conducted the enumeration; while at Shillong and other places under direct administration, the work was done by officers attached to the Deputy-Commissioner's office. The results are thus returned:—Adults—males, 39,882; and females, 44,298: total adults, 84,280. Children under twelve years of age—males, 28,611; and females, 28,947: total children, 57,558. Total males, 68,593; total females, 73,245. Grand total, 141,838; proportion of males, 48·36 per cent. The total area of the District, according to the latest returns, is 6157 square miles, which gives an average density of 23 persons per square mile. The number of villages is 1003; the number of houses, 30,557, of which 350 are returned as of the better sort. 648 659 161 161 162

ETHNICAL DIVISION OF THE PEOPLE.—The population consists almost exclusively of aboriginal tribes and races, viz. Khásiás and Syntengs (who form the bulk of the inhabitants of the Khási and Jáintiá Hills respectively), Míkírs, Gáros, and Kukís. The only other dwellers in the Hills are the European officials and military officers at Shillong and Cherrá Púnjí, with their native servants and followers, a few Bengálí officials, and the sepoys of a regiment of native infantry. The classification of the inhabitants according to religion shows:—141,283 aborigines; 365 Hindus; 62 Muhammadans; and 128 Christians, including 35 Europeans, 8 Eurasians, and 85 native converts. 563 162 [648] [779]

THE KHASIAS.—The following sketch of the physical characteristics and customs of the Khásiás has been kindly furnished to me by the Deputy-Commissioner, Colonel Bivar; it is reproduced almost verbatim from his report and on his authority:— 144

1: Gurdon E-4, 5 (no-date) 1907 AR7 Khasi AR7

accorded by the Khasis to the female sex that successive 162
censuses have shown that the women of this race
considerably exceed the men in number. According
to the census of 1901, there are 1,118 females to every
1,000 male Khasis. This excess, however, is surpassed
by that of the Lushais, 1,191 to 1,000, and it may
possibly be due to the greater risks to life encountered
by the men, who venture far into the plains as traders
and porters, while the women stay at home. Habits of 165
intemperance, which are confined to the male sex, may
also explain a greater mortality among them.

It would be interesting to investigate the effect 161
on reproduction of the system of matriarchy which 163
governs Khasi family life. The increase of the race is
very slow. In the census of 1891 there were enumerated
only 117 children under 5 to every hundred married
women between 15 and 40, and in 1901 this number fell
to 108. It has been suggested that the independence
of the wife, and the facilities which exist for divorce,
lead to restrictions upon child-bearing, and thus keep
the population stationary. The question might with
advantage be examined at the census of 1911.

The next characteristic of the Khasis which marks 787
them out for special notice is their method of divination 782
for ascertaining the causes of misfortune and the
remedies to be applied. All forms of animistic religion
make it their chief business to avert the wrath of the
gods, to which calamities of all kinds—sickness, storm,
murrain, loss of harvest—are ascribed, by some kind of
propitiation; and in this the Khasis are not singular.
But it is somewhat surprising to find among them the 787
identical method of *extispicium* which was in use among 171
the Romans, as well as an analogous development in
the shape of egg-breaking, fully described by Major
Gurdon (p. 221), which seems to have been known to

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

THE KHASIS

SECTION I.

HABITAT.

101 162 THE Khasis reside in the Khasi and Jaintia Hills district of Assam. They number 176,614 souls, which total is made up of:—

Khasis	167,816
Syntengs	4,[illegible]
Christian Khasis	1[illegible]
Khasis inhabiting other districts	4,[illegible]
	176,614

131 162 563 The Khasi and Jaintia Hills district is situated between 25° 1' and 26° 5' North Latitude, and between 90° 47' and 92° 52' East Longitude. It contains an area of 6,157 square miles, with a total population at the Census of 1901 of 202,250 souls. In addition to the Khasis there are some members of Bodo tribes inhabiting parts of the district.

The Lyngam tribe appears to have been reckoned in 1901 as Khasi, there being no separate record at the last Census of these people.

101 131 [133] 563 The district is split up into two divisions, the Khasi Hills proper and the Jaintia Hills. The Khasi Hills form the western portion of the district and the Jaintia Hills the eastern. The Khasis inhabit the Khasi Hills proper, and the Syntengs, or Pnars, the Jaintia Hills. The latter hills take their name from the Rajas of Jaintia, the former rulers of this part of the country, who had as their capital Jaintiapur, a place situated at the foot of the Jaintia Hills on the southern side, which now falls within the boundaries of the Sylhet

[P.J]

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

577 plains, jealous of their power, brave in action, and have an aversion to falsehood."

717 Khasis of the interior who have adopted Christianity are
177 generally cleaner in their persons than the non-Christians,
515 and their women dress better than the latter and have an air
942 of self-respect about them. The houses in a Christian village are also far superior, especially where there are resident European missionaries. Khasis who have become Christians often
771 take to religion with much earnestness (witness the recent
717 religious revival in these hills, which is estimated by the Welsh
794 missionaries to have added between 4,000 and 5,000 converts to Christianity), and are model Sabbatarians, it being a pleasing sight to see men, women, and children trooping to church on a Sunday dressed in their best, and with quite the Sunday expression on their faces one sees in England. It is a pleasure to hear the sound of the distant church bell on the hill-side on a Sunday evening, soon to be succeeded by the beautiful Welsh hymn tunes which, when wafted across the valleys, carry one's thoughts far away. The Welsh missionaries have done, and continue to do, an immense amount of good amongst these people. It would be an evil day for the Khasis if anything should occur to arrest the progress of the mission work in the Khasi Hills.

GEOGRAPHICAL DISTRIBUTION.

• 11.2 The Khasis inhabit the Khasi and Jaintia Hills, although
101 there are a few Khasi settlers in the neighbouring plains districts. The Census Report of 1901 gives the following figures of Khasi residents in the plains:—

Cachar	333
Sylhet	3,083
Goalpara	4
Kamrup	101
Darrang	10
Nowgong	29
Sibsagar	62
Lakhimpur	22
Lushai Hills	27
North Cachar	32
Naga Hills	67

l: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Garo Hills	117	162
Manipur	69	101
Total	4,091*	

The following information regarding the general aspect of [127] the Khasi and Jaintia Hills district, with some additions, is 133 derived from Sir William Hunter's Statistical Account of Assam. The district consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is very steep until a table-land is met with at an elevation of about 4,000 feet at Cherrapunji. Higher up there is another plateau at Mawphlang. This is the [361] highest portion of the hills, some villages being found at as high an elevation as close on 6,000 feet above sea level. Fifteen miles to the east of Mawphlang, and in the same range, is situated the civil station of Shillong, at an average elevation of about 4,900 feet. The elevation of the Shillong Peak, the highest hill in the district, is 6,450 feet above sea level. On the northern side of the hills are two plateaux, one between 1,000 and 2,000 feet below the level of Shillong, and another at an elevation of about 2,000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where 137 the hills have been denuded of forest, the country is covered 185 with short grass, which becomes longer and more rank in the 374 lower elevations. This denudation of forest has been largely 327 due to the wood being used by the Khasis for fuel for iron smelting in days gone by. The Government, however, has taken steps to protect the remaining forests from further 137 spoliation. A remarkable feature is the presence of numerous sacred groves situated generally just below the brows of the [778] hills. In these woods are to be found principally oak and rhododendron trees. The fir-tree (Pinus Khasia) is first met with on the road from Gauhati to Shillong, at Umsning, at an elevation of about 2,500 feet. In the neighbourhood of Shillong the fir grows profusely, but the finest fir-trees are to be seen

* The figures for Khasi population in the Khasi and Jaintia Hills district will be found under "Habitat."

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

SECTION II.

OCCUPATION.

241 THE greater proportion of the population subsists by cultiva-
463 tion. Cultivation of rice may be divided under two headings,
[162] high land or dry cultivation and low land or wet cultivation. The total number of persons who subsist by agriculture generally in the hills, is given in the last Census Report as 154,907, but the term agriculture includes the cultivation of the potato, the orange, betel-nut and *pán*. A full description of the different forms of agriculture will be given under the
463 heading "Agriculture." A considerable number of Khasis earn
482 their livelihood as porters, carrying potatoes to the markets on
439 the Sylhet side of the district, from whence the crop is conveyed by means of country boats to the different places of call of river-steamers in the Surma Valley, the steamers carrying the potatoes to Calcutta. Potatoes are also largely carried to Shillong by porters, where the tuber is readily bought by Marwari merchants, who load it in carts to be conveyed by road to Gauhati, from which station it is again shipped to
482 Calcutta and Upper Assam. Many persons are also employed in
463 carrying rice up the hill from Theria to Cherrapunji, Shillong,
[466] and on to other places. Salt is also carried by porters by this route. Many Khasis, both male and female, live by daily labour in this way, earning as much as eight annas, and
[162] six annas a day, respectively. The Census Report of 1901 shows some 14,000 "general labourers" in the district, the greater number of whom are porters and coolies, both male
[357] and female, employed on road work and on building. In Shillong the Government Offices and the printing press give employment to a certain number of Khasis. There is also a fair demand for Khasi domestic servants, both among the Europeans and the Bengali and Assamese clerks who are employed at the headquarters of the Administration.

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

headquarters of the Administration. The manufacture of country spirit gives employment to a considerable number of persons, most of whom are females. At a recent census of the country stills in the district, undertaken by the district officials, the number of stills has been found to be 1,530. There must be at least one person employed at each still, so that the number of distillers is probably not less than 2,000, possibly more. The spirit is distilled both for home consumption and for purposes of sale, in some villages almost entirely for sale. In the Jaintia Hills stock-breeding and dealing in cattle provides occupation for 1,295 people, according to the last census. The cattle are reared in the Jaintia Hills and are driven down to the plains when they reach the age of maturity, where they find a ready market amongst the Sylhetis. Cattle are also driven into Shillong for sale from the Jaintia Hills. Another place for rearing cattle is the Siemship of Nongkhlaw, where there is good pasturage in the neighbourhood of Mairang. These cattle are either sold in Shillong or find their way to the Kamrup district by the old Nongkhlaw road. Cattle-breeding is an industry which is capable of expansion in these hills. There are a few carpenters to be found in Shillong and its neighbourhood. The Khasis are said by Col. Waddell to be unacquainted with the art of weaving; but the fact that a considerable weaving industry exists amongst the Khyrwang villages of the Syntengs, and at Mynso and Suhtnga, has been overlooked by him. The Khyrwangs weave a special pattern of cotton and silk cloth, striped red and white. In Mynso and Suhtnga similar cloths are woven, also the sleeveless coat. In former days this industry is said to have been considerable, but it has been displaced to a large extent of late years by Manchester piece goods. The number of weavers returned at the last census in the district was 533. The Khasis and Mikirs of the low country, or Bhois as they are called, weave cotton cloths which they dye with the leaves of a plant called *u noli*. This is perhaps the wild indigo, or *ram*, of the Shan settlers in the Assam Valley. The weavers are almost always females. An important means of subsistence is road and building work; a considerable number of coolies, both male and female, are employed under Government, practically throughout the year, in

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

been denuded completely of timber, charcoal being necessary for smelting, has affected the production almost as much as the presence of cheap iron in the market. 327

MANUFACTURE OF ERI SILK CLOTHS AND COTTON CLOTHS IN THE JAINTIA HILLS.

The number of weavers in the district at the last Census was 533. This number in the Census Report is ascribed to the cotton industry, no mention being made of weavers of silk. 288 [162] The spinning of Eri silk thread, and weaving it into cloths is, however, a fairly considerable industry amongst the Khyrwang and Nongtung villages of the Jaintia Hills. The Nongtungs and Khyrwangs rear their own Eri worms, and spin the silk from the cocoons. The late Mr. Stack, in his admirable note on silk in Assam, says, "Throughout the whole range of the southern hills, from the Mikir country, Eri thread is in great request for weaving those striped cloths, in which the mountaineers delight," but this observation should have been confined to the Jaintia Hills portion of this district, the Khasis not weaving themselves either in silk or cotton. The Khasis obtain their silk cloths from the Assam Valley, and from the Nongtung or Khyrwang villages in Jaintia. The latter villages have given the name to the striped cloth, *ka jáin Khyrwang*, which is almost invariably worn by the Syntengs. Mr. Stack has given in detail a description of the silk industry in Assam; and it is not therefore necessary to go over the same ground here. The Khyrwang cloth is red and white, mauve and white, or chocolate and white, the cloth being worn by both men and women. The Khyrwang cloths vary in price from Rs. 5 to Rs. 25, according to size and texture. [435] These cloths are the handiwork of women alone, and a woman working every day regularly will take six months to manufacture a cloth valued at Rs. 25; but, as a rule, in the leisurely manner in which they work, it takes a year to complete it. [462]

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

COTTON CLOTHS.

283 In the Jaintia Hills at Mynso cotton is spun into thread, and
288 weaving is carried on there, but on a limited scale. The Mynso people weave the small strips of cloth worn by the men to serve the purpose of the Assamese *lengti* or Hindi *languti*. In Suhtnga the people import cotton thread from Mynso and weave the (*ingki*) or sleeveless coat, peculiar to the district; these coats are dyed red and blue. The dark blue or black dye
824 is obtained from the leaf of a plant called *u sybu*, which
386 Mr. Rita has classified as *strobilanthus hoeditolius*, which
288 grows in the gardens round the homesteads. The leaves are dried, then reduced to powder, mixed with hot water, and the skeins of thread are steeped in the liquid. The colour is permanent. The red dye is obtained from the mixture of the dry bark of two shrubs, *ka lapyndong* (*symplocos racemosa*, Roxb.), and *ka 'larnong* (*morinda-tinctoria*, Roxb.), the latter being the same as the Assamese (আচুকাঠ) *áchukáth*. The bark is dried, then pounded, and the two sorts are mixed together and made into a paste with hot water. The skeins are steeped in this mixture for twenty-four hours, then taken out and divided, and again steeped for another twenty-four hours. The Lalungs and Bhois and Lynngams all weave cotton cloths, which are generally dyed blue, sometimes striped blue and red. The Wárs weave cotton cloths which are dyed red and yellow, the cloths being woven in checks. Mr. Darrah remarks that the cotton grown in the Jaintia Hills is said to be the best cotton produced in the province. Its thread can be more closely woven than that of other kinds. This statement, however, is not borne out by Mr. Allen writing in 1858, who says that the cotton is of inferior quality, the staple being short and woolly. The cotton cloths woven by the Bhois are called *spua*.

POTTERY.

[162] The Census Report of 1901 gave the number of persons who
323 are supported by the manufacture of pottery at 54 only. Pottery is manufactured at one place only in the Jaintia Hills,

Family Property and Maternal Rights

/127/ by C. Becker S.D.S., Wurzburg

114 The fall of 1910 and the entire following year found the distinguished head of the Ethnographic Museum in Munich, to whom this anniversary volume is dedicated, on a research and collection trip in the extensive and inexhaustible territories of India. He was accompanied by his active wife, who served as his scientific assistant. From Burma, a mine of rich, ethnographic treasure and where the greatest part of their Indian stay was spent, their journey led the research couple into Assam, situated in the northeast of India, a country of equal significance. Assam certainly belongs politically to an-
101 terior India, but forms a bridge to interior India both ethnographically and linguistically.

Among the mountain peoples who inhabit the chain of hills which traverses the length of present-day Assam, and which separates the two largest parts of the country from each other, the Brahmaputra Valley in the north and the Surma Plain in the south, is one of the most interesting and doubtless the most advanced of the tribes, the Khasi, who inhabit the so-called Khasi and Jaintia Mountains. It
[631] was in Shillong, the center of this area, which is now the capital of the country Assam under the English government, where towards the end of September, 1911, I first became acquainted with Professor D. L. Scherman and his wife and where a friendship of many years
133 had its beginning. Therefore this little study will lead us to the Khasi Mountains, to its slopes overgrown with its peculiar pine trees, which receive greetings across the plains from the snow-crowned peaks of the Himalayas, which are flooded by the mighty waves of the Brahmaputra River and the alternating inundations of the Surma River. Here a contented and cheerful little people live who have maintained their own special characteristics in spite of the many European influences and those of neighboring cultures.

162 /128/ Of the entire population of 243,263 people, who form the inhabitants of the Khasi and Jaintai Mountains (1), 203,855 are Khasi.

1. The following statistical estimates are taken from the Census of India 1921, Vol. III, Assam, (Shillong, 1923) pp. I and II.

162
797 Of those, 37,852 have adopted Christianity, while the others are still adherents of ancient animistic cults, with the exception of somewhat

more than a thousand of them who have been converted to the Hindu 162 [797]
religion.

This group of people possesses the possibility of expansion, since they have at their disposal within the area of the Khasi and Jaintia [311]
Mountains a territory of 6,022 English square miles, with only 40 persons per square mile. Although wide areas are not built up and the system of shifting fields prevents the full utilization of the land, it is still true that with this small population figure by far the largest part of the whole population (200,781) is dependent on agriculture; trade and manufacturing only play a subordinate part.

With regard to the division of the sexes, the two large religions 562
of Assam, Hinduism and Mohammedanism, show the same proportion 162
as in the rest of India, a lesser number of women than men. But among the Khasi the women are more numerous than the men. In the Brahmaputra valley with its greater Hindu population there are only 892 women for every 1,000 men; in the Surma valley, with a greater Moslem element, there are 937. But the situation is reversed among the Khasi, where there is a surplus of 74 women for every thousand men. The position of the women is basically different among this people. It is based on the customs and usages of maternal rights that prevail among them, which are predominantly based on possession and which find honorable expression in possession.

1. Property Rights in the Family Property.

The great principle which governs property among the Khasi, is 421
that all family property rests in the hands /128: A/ /Fig. 1. Khasi 613
Girls and Women with their Carrying Baskets. Fig. 2. An Old Clan 596
Mother in the Village Laitumkhra. / /128: B/ /Fig. 3. At the Oracle of Egg Throwing/. Fig. 5. Khasi Girls and Men in Festive Dance Clothing. / /128: C/ /Fig. 4. A Group of Synteng/ /128: D/ Fig. 6. A Holy Grove and Part of the Village Raliang/ /129/ of the women and not of the man. The man can never be the owner of family property, and it can never be transferred to him. He may perhaps acquire some property through his own industry and work, but even that will pass into feminine hands by the path of inheritance. The concept of family is not as narrowly drawn here as in our country. This is a question of the clan-family, the clan. The head of it is always the youngest daughter, who, even when she has become old, bears the honorable name ka barit in the Jaintia Mountains, and in the Khasi Mountains ka khadduh, the last, the youngest. Around her gather her nearest 613
blood relatives, brothers and sisters, and children. For example let 596

I. Setting and Economic Background of Sohkynduh and Kongton

361 Sohkynduh and Kongton are villages of the Kadashinong,[1] one of
632 the areas under the Cherra Chief. The Kadashinong is situated on
[131] the southern slope of the Khasi Hills, in what is called War country. These two villages are situated at the farthest point from both Shella, the centre bordered by the plain, and Cherrapunjee, the seat of the
184 Cherra Chief, one of the centres of the upland Khasi Hills. The people
121 at Cherrapunjee say that these villages are one of the most backward
[171] parts of the Khasi Hills. They correspond to Rombagiri in the Garo Hills, as they lie in the innermost parts and more traditional economic and social settings have been preserved there than in other villages. These are also the reasons why I selected those villages as my field.

361 It is nine miles to Sohkynduh from Cherrapunjee, crossing two
[131] deep valleys towards the east. Kongton is located at the heart of the mountain ranges, ten miles from Cherrapunjee, towards the north-
[487] east. It is about twelve miles from Sohkynduh to Kongton, and the way leads through one of the most difficult passes, where even
[162] villagers seldom travel. In December, 1955, Sohkynduh was a community of 48 households (List 6), and Kongton of 62 households (List 9). The settlements of both villages are clustered in the southern depressions of a mountain, not far from the summit, a typical location
[134] of Khasi villages. Sohkynduh has poor soil, covered with plenty of pieces of stones. The yield therefore is very poor. On the other hand, Kongton, a much older village, enjoys fertile soil, and is one of the most prosperous communities in the Kadashinong.

241 The major economy of both villages is shifting cultivation. We have already seen, in the chapters on the Garo, the fundamental technique of "Jhuming cultivation." The differences between the
423 Garo and the Khasi shifting cultivation are to be found in two aspects:
[171] one is the nature of the crops and the other is the type of landowner-
[241] ship. In this area, the main crop is millet, while that of the Garo is rice. Besides the shifting cultivation, the Khasi have pan-leaf gardens and sometimes pineapple gardens, though on a small scale and not in every household. The most important feature of Khasi shifting cultivation is the development of private ownership. In the tribal areas in Assam, such private ownership of the jhum field is quite an

1. Kadashinong is the name of a group of villages. Its literal meaning is "twelve villages," and it comprises the following villages: Sohkynduh, Rymmai, Mawbawein, Mawshiut, Mawmang, Kongton, Shyntiang, Krohiawhiar, Pdei, Tenshun, Nongpriang, and Diengsaw. (Khasi spelling follows the customary usage in Cherra State.)

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

177 people remained non-Hindu in their basic beliefs and social customs. Hindu
648 influences are nevertheless predominant in their culture, especially in their way
771 of living which shows a practical adaptability, somewhat similar to the Japanese
795 acceptance of modern western culture without becoming Christian. In my
[797] census of Shella village, the people calling themselves 'Hindu' amount to 40 per cent of the total, but they are the recent converts to the Ramakrishna School
[162] which established a missionary station at Shella after the Partition. The Christians constitute 30 per cent of the total, most of them having been converted during the last ten years, as in the case of the Ramachrishna School.[1]
[458] The rest remain as they were, of Khasi belief. These conversions to either Ramachrishna or Christianity seem to have been encouraged by the unstable situation of the people resulting from the recent economic depression in this area.

439 The Partition of India and Pakistan in August 1947, which drew the bor-
458 derline a few miles south of Shella village, considerably upset village economy by stopping all trade with Bengal, though a limited amount of trade is allowed
648 with local people at the border. Because of this political change, all the produce of Shella gardens is rotting away for lack of markets, while all of the rice fields were taken by Pakistan. Goods now come to Shella only from the uplands, carried upon men's shoulders over the most difficult pass, which makes everything very expensive. Many families have sold their gold and other treasures, and some families are facing starvation.[2]

182 Concerning the conversion to a new religion, an interesting phenomenon
171 is to be observed. The conversion to Christianity or to Ramakrishna is mostly by individual: I found in my census that the wife and husband often belong to
592 different religions. This is a very different picture from the Garo, among whom
613 I always found that the husband and wife belonged to the same religion: the conversion of the husband to Christianity was always followed by that of the
771 wife. I think this reflects the structural differences which influence the actual relationship between the husband and wife. Among these Khasi, instead of
795 the husband and wife, the maternal uncle and his nephews and nieces are mostly of the same religion. The function of the *iing*, the most important social and religious unit, thus appears also in the conversion to a new religion, stronger than that of a domestic unit.

Intermarriage.

648 The close economic and cultural contact of the Shella people and the Bengalee
771 is not matched by social contact. The essential barrier between the two peoples is the difference of religion which dominates the entire social order in each
563 society. Though these Khasi were important traders, richer than the neighbouring Hindu peasants, they were considered by the Hindu as outcasts with whom they never shared social activities. Intermarriages were therefore very rare. In Shella village, only two exceptional cases were found in my census:

1. A Khasi woman married to a Gurka (cattle-keeper); they live at Shella Bazaar (Sholap).
2. A Khasi woman has marital relation with a Bengalee medical doctor who has resided at Disong in Shella for six years. He already has a Bengalee

1. These two entirely different missionary activities are competing with each other, and are somewhat related to the political powers within this area.
2. The state government is doing its best to provide them with additional facilities: for example, providing air transport for the transportation of oranges from Shella to Gauhati and Calcutta. However, such arrangements cannot cover the great economic loss suffered by the Shella people.

group of matrilineal and Mon-Khmer-speaking people who claim as their ancestral homeland the present-day United Khasi–Jaintia Hills District (within approximately 90° 47′ and 92° 52′ E. and 25° 5′ and 26° 5′ N.). This group includes the Jaintias (also Pnar or Synteng) in the southeast, who differ from the Khasis primarily in their duolocal residence pattern and less virulent forms of sorcery. (The Hadem in eastern Jaintia are a Kuki people.) It also includes the Lyngngams (also spelled Lynngam) in the west, who practice migratory swidden agriculture and certain peculiar funerary rites, and are said by Ehrenfels (1955) to be culturally intermediate between Khasis and Garos. Finally, it includes Bhois, Wars, and upland Khasis, which terms are primarily territorial. Bhoi country is the north-central part of the District, and is culturally complicated by the presence of Mikirs, Lalungs, and Nepalis. War country spans the entire southern length of the District, so that Wars divide into Jaintia Wars and Khasi Wars; of these, the Khasi Wars have traditionally transmitted property to sons as well as to daughters. The upland center of the District is the country of the Khasis proper, those whose culture provides the most useful model for interpreting the variations found elsewhere. [For general reference on all categories of Khasi culture, cf. Costa 1936 and 1937; also Gurdon 1907, especially for data on regional variations.] **Geography.** The District is 5,554 square miles of hilly tableland, intricately dissected by numerous rivers, and marked by significant ecological variation over very short distances. The tablelands step gently downward north from Shillong Peak, which at 6,445 feet is the highest point in the District, and over about 55 miles ease into the Brahmaputra valley where this is some 250 feet above sea level. To the south, the land slopes more steeply downward for about 20 miles, and then drops abruptly, in cliff and steep-slope formations, to the Ganges sea-level delta that begins at its north with Sylhet. The annual southwest monsoons drop torrential rains around Cherrapunji and Mawsynram villages (for Cherrapunji, a record 805 inches in 1861), but then, reaching Shillong 33 miles to the northeast, provide only about 100 inches per year. Rainfall is again greater in Bhoi, which shares the Brahmaputra valley climate. Climate is temperate on the high Shillong plateau, where it seldom freezes and never snows. To the north, climate becomes subtropical, forest is jungly, and fauna abound. The climate to the south is also subtropical. [Cf. Hooker 1891: chap. XXIX.] **Linguistic affiliation.** Khasi is one of the major Mon-Khmer languages, related to Mon, Khmer, Semang-Sakai, Nicobarese, and Palaung-Wa. The major Khasi dialects are Khasi, Jaintia, and Lyngngam, to which Grierson adds War. Further minor variations occur from village to village. The Khasis had no script until 1842, when the roman alphabet was successfully applied to the Cherrapunji dialect of Khasi proper. [Cf. Rabel 1961; Grierson 1903-28: 2; Bareh 1962.]

[P. 111 A] AR7 Khasi AR7

also active, and in that decade one U Kyrhai, a Khasi 797
convert to Presbyterianism, left that church and
founded a unique sect that blends something of him-
self with something of mystical Hinduism and Chris-
tianity. The competitors who most seriously threat-
ened the dominance of the Welsh Presbyterians were
the Roman Catholic missionaries who arrived in Shil-
long about 1890. Catholics have since opened a num-
ber of high schools, colleges, convents, and orphan-
ages. They also established a technical school, and
are now constructing a seminary. At the present time, 779
one estimate is that there are about 100,000 Presby-
terians and 80,000 Roman Catholics among Khasis. [162]
Members of other Christian sects are comparatively
few; adherents to Hinduism and Islam are fewer still,
comprised chiefly of Khasi women married to Hindu
or Muslim men; U Kyrhai's sect is dying out; and
the balance of Khasis are, according to their own
term, "Khasi" in religion. [Cf. Lyngdoh 1937; Morris [113]
1910; Ropmay 1940; Singh 1950; Pugh 1951.] Super-
naturals. The great deities are two, an unnamed 776
masculine God (U Blei) and an unnamed feminine
Goddess (Ka Blei Nongsynshar Nonghukum). God 771
created the earth, and in the beginning instructed
man in cultivation techniques and also laid down 773
the framework of a moral order that should guide his
every move if he wished to join God in heaven after
death. This framework was then filled in by the first
ancestors, who are therefore the authorities on the
subject and are semideified as Ka Iawbei (the moth-
er), U Thawlang (the father), and U Suidñia (the
mother's brother). Very early, Goddess undertook to
keep account of the numbers of human beings on
earth, and this role was so important, relating as it
did to the health and the multiplication of the peo-
ple, that she became of major importance in the
Khasi pantheon. When sin beset human society, God
activated automatic punishments in the form of nat-
ural calamities, and man finally decided that some
animal should go and intercede with God on behalf
of humans. The cock went, agreed to take upon him-
self the burden of human sin, and received instruction
in the correct divinatory and sacrificial techniques
for which he would be one of the main objects of
the knife. Again, over a period of time, it was the
ancestors who perfected these techniques. Now, God
is regarded as powerful and merciful, but passive.
His punishments have their own impetus, and the ex-
pression of His mercy is solidified in ritual. Goddess
is more vaguely conceived, but is much closer to the
individual. [But cf. Ehrenfels 1950, who conceives of [114]
one double-sexed, great deity among Khasis.] Regard-
ing ancestors, it is never clear from prayers whether 776
supplication is to generalized semideities or to par- 771
ticular first ancestors of a Khasi's own matrilineage, [769]
and such a distinction seems not to matter. There are
three other categories of minor deities: those who
protect places (such as villages, groves, or springs),

• 162

[For the composition of population by social groupings, see category 116, pp. 29-52, 62-64, 75-76, 81-84, 106-123, 127-129, and 149-152.]

and even the well to do ones do not feel anything to work as labourers in other's farms. It is almost customary among the agriculturists to work in other's farms on wage basis, when agricultural operation in one's own farm are over. This is probably an outcome of the difficult transport situation. Among the non-agriculturists and those who follow agriculture as subsidiary occupation, a large number are porters and labourers engaged in jobs like transporting of goods from place to place, collection of limestone, sand, fuel, Collieries and forests of the district also offer employment to a good number of people. Since the taking up of road programme under the plan, a large number of people are getting employment in construction of roads, etc. It is heartening to note that for construction of roads, nay for all kinds of works demanding unskilled labourers, the district locally supplies the whole labour force. People in the various local points of the district, particularly those living in higher hills are mainly engaged in trade. The Khasis are indefatigable traders and have been able to keep almost the whole of the small trade in the district in their own hands. A small proportion of the people are engaged in cottage industries such as stone cutting, brick making, bee keeping, blacksmithy, cane and bamboo works, etc.

The number of persons returned in the 1951 census under each of the eight main livelihood classes for the rural tract of the district was as follows.

TABLE 1

Number of Persons (Source 1951 Census)

Head	Male	Female	Total	P.C.
(1)	(2)	(3)	(4)	(5)
A. Agricultural class:—				
1. Cultivators of land wholly or mainly owned and their dependents.	90,603	92,107	1,82,710	59·89
2. Cultivators of land wholly or mainly unowned and their dependents.	16,014	16,109	32,123	10·53
3. Cultivating labourers and their dependents.	14,053	14,941	28,994	9·50
4. Non-cultivating owners of land, agricultural rent receivers and their dependents.	344	562	906	·30
Sub-total	1,21,014	1,23,719	2,44,733	80·22
B. Non-agricultural class:—				
5. Production other than cultivation.	11,794	10,309	22,103	7·24
6. Commerce	3,237	4,069	7,306	2·39
7. Transport	355	264	619	·20
8. Other services and miscellaneous sources.	17,462	12,864	30,326	9.95
Sub-total	32,848	27,506	60,354	19.780

public auction. The Assam rules, as revised in 1875-76, reserve to Government the right of pre-emption at the price of Rs. 600 (£60) in the case of every elephant captured between 6 feet and 7½ feet in height. For every elephant caught that is not purchased by Government, a royalty of Rs. 100 (£10) is payable within one month after capture. Certain methods of hunting are prohibited. 224 648 651

POPULATION.—Prior to 1872 no attempts had been made at a Census of the Khási and Jáintiá Hills, but in 1870 the Deputy-Commissioner approximately estimated the population at 118,925 souls. In 1872, at the time of the Bengal Census, operations were set on foot in these Hills, but on a less elaborate system than in Regulation Districts. In the Khási Hills, the Census of the various petty States was effected through the chiefs; in British territory in the Jáintiá Hills, the *dollois* conducted the enumeration; while at Shillong and other places under direct administration, the work was done by officers attached to the Deputy-Commissioner's office. The results are thus returned:—Adults—males, 39,882; and females, 44,298: total adults, 84,280. Children under twelve years of age—males, 28,611; and females, 28,947: total children, 57,558. Total males, 68,593; total females, 73,245. Grand total, 141,838; proportion of males, 48·36 per cent. The total area of the District, according to the latest returns, is 6157 square miles, which gives an average density of 23 persons per square mile. The number of villages is 1003; the number of houses, 30,557, of which 350 are returned as of the better sort. 648 659 161 161 162

ETHNICAL DIVISION OF THE PEOPLE.—The population consists almost exclusively of aboriginal tribes and races, viz. Khásiás and Syntengs (who form the bulk of the inhabitants of the Khási and Jáintiá Hills respectively), Míkirs, Gáros, and Kukis. The only other dwellers in the Hills are the European officials and military officers at Shillong and Cherrá Púnjí, with their native servants and followers, a few Bengálí officials, and the sepoys of a regiment of native infantry. The classification of the inhabitants according to religion shows:—141,283 aborigines; 365 Hindus; 62 Muhammadans; and 128 Christians, including 35 Europeans, 8 Eurasians, and 85 native converts. 563 162 [648] [779]

THE KHASIAS.—The following sketch of the physical characteristics and customs of the Khásiás has been kindly furnished to me by the Deputy-Commissioner, Colonel Bivar; it is reproduced almost verbatim from his report and on his authority:— 144

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

It may perhaps be ascribed to the pre-eminence
accorded by the Khasis to the female sex that successive 162
censuses have shown that the women of this race
considerably exceed the men in number. According
to the census of 1901, there are 1,118 females to every
1,000 male Khasis. This excess, however, is surpassed
by that of the Lushais, 1,191 to 1,000, and it may
possibly be due to the greater risks to life encountered
by the men, who venture far into the plains as traders
and porters, while the women stay at home. Habits of 165
intemperance, which are confined to the male sex, may
also explain a greater mortality among them.

It would be interesting to investigate the effect 161
on reproduction of the system of matriarchy which 163
governs Khasi family life. The increase of the race is
very slow. In the census of 1891 there were enumerated
only 117 children under 5 to every hundred married
women between 15 and 40, and in 1901 this number fell
to 108. It has been suggested that the independence
of the wife, and the facilities which exist for divorce,
lead to restrictions upon child-bearing, and thus keep
the population stationary. The question might with
advantage be examined at the census of 1911.

The next characteristic of the Khasis which marks 787
them out for special notice is their method of divination 782
for ascertaining the causes of misfortune and the
remedies to be applied. All forms of animistic religion
make it their chief business to avert the wrath of the
gods, to which calamities of all kinds—sickness, storm,
murrain, loss of harvest—are ascribed, by some kind of
propitiation; and in this the Khasis are not singular.
But it is somewhat surprising to find among them the 787
identical method of *extispicium* which was in use among 171
the Romans, as well as an analogous development in
the shape of egg-breaking, fully described by Major
Gurdon (p. 221), which seems to have been known to

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Mr. Jenkins, in his interesting little work on "Life and
753 Work in Khasia," gives a slightly different account of the
796 superstition, in that he states that it is the sick person who
826 is possessed by *ka Tarah*. The above belief is perhaps a
164 Synteng development of the Khasi *thlen* superstition. In
177 the Jaintia Hills "the small-pox" is believed to be a goddess, and is reverenced accordingly. Syntengs regard it as an honour to have had small-pox, calling the marks left by the disease the "kiss of the goddess"; the more violent the attack and the deeper the marks, the more highly honoured is the person affected. Mr. Jenkins says, "When the goddess has entered a house, and smitten any person or persons with this disease, a trough of clean water is placed outside the door, in order that every one before entering may wash their feet therein, the house being considered sacred." Mr. Rita mentions cases of women washing their hair in water used by a small-pox patient, in order that they may contract the disease, and women have been known actually to bring their little children into the house of a small-pox patient, in order that they may become infected and thus receive the kiss of the goddess. It is possible that the Syntengs, who were for some time under Hindu influences, may in their ignorance have adopted this degraded form of worship of the Hindu goddess, "Sitala Devi," who is adored as a divine mother under different names by Hindus all over India: *cf.*, her name *mari-amman*, or mother of death, in the South of India, and the name Ai, mother, of the Assamese.

In the Khasi Hills the god of small-pox is known under the name of *u Siem ñiang thylliew*. He is not, however, appeased in any way, the people calling on two other spirits, *Thynrei* and *Saps*, to whom a fowl or a goat is offered.

This section cannot be closed without some reference to the
776 household gods of the Syntengs. The legend is that in ancient
773 times there came a woman "from the end of heaven to the borders of the country of *u Truh*" (the country of the plains people at a distance from the foot of the Khasi and Jaintia Hills). The name of the woman was Ka Taben, and she was accompanied by her children. She offered herself to *u Dkhar*, the plains man, as a household goddess, but he rejected her. She then went to the Khasis, who were ploughing their fields,

15: Nakane E-5 (1955-1956) 1967 AR? Khasi AR?

Sholla

Confederacy forms a more marked endogamous community, though being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people.

The Economy and the People

Sholla lies along the upper part of the Sholla River and stretches upwards along the steep slope, looking down towards the Bengal plain. The climate of this part of the hills is considered to be one of the worst in tropical India for human habitation. The Bengal plain, though warmer than this area, is considered more healthy. This border land is the zone of malaria, typhoid, black fever, cholera, etc. None of the Bengalee peasants dare to live in such an area. However, it is the most fertile for products such as betel-nuts, pan-leaves, oranges, bananas and pineapples, and it also produces limestone. These people seem to prefer to settle in this zone and to enjoy its prosperity, at the expense of human lives every year, especially between March and September, the inhabitants suffer from various fevers and dysentry and other diseases, many of the weaker facing death.

Before the Partition of India and Pakistan, the products of Sholla were carried down the Sholla River to Sylhet, one of the biggest centres in East Bengal, which brought unimaginable wealth to the Sholla people. Their houses were built by carpenters from Sylhet. The style and structure of these houses were exceptionally elaborate for the Khasi. They purchased vast rice fields in the plain, which used to be cultivated by Bengalee and Garo labourers engaged by them. These Khasi do not themselves know how to cultivate rice fields; they have always been managers or landowners. Their boys used to be sent to high schools and colleges in Sylhet. As a result of their trading with the Bengalee, many of them read and speak fluent Bengalee. There is no difference between their style of clothing and that of the Bengalee, though the women maintain their traditional dress in the Sholla style.

They have thus been distinguished from the rest of the Khasi not only geographically, but also economically and culturally. Their personality also differs sharply from the rest of the Khasi. They are very sociable, and quick, a quality lacking among the Khasi of Sohkynduh and Kongton. They are clever enough to deal with strangers. The upland Khasi say Sholla people are very cunning. This remark shows one side of these people. They had to be cunning, since they traded with the Sylhet Bengalee who were said to be the most cunning of their race. Their role in the trade and in the history of the modernization of the Hills was considerable. For centuries they represented intellectual Khasi owing to their contact with Hindu civilization, while the Hills remained in darkness. They assumed an important role when the British established an administration in the Hills, and even up to now, many leading Khasi originated from this area: for instance, Lalit Hati, the first interpreter of the British Headquarters at Cherrapunjee; Jashon Roy, who was the first Magistrate among the Khasi; Mahem Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jashon Roy); Nicholas Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nicholas Roy), Principal of the Gauhati University, etc.

Through constant cultural contact with Hindu, and encouraged by their economic prosperity, the Sholla Khasi, like the Jaintias, have been much influenced by Hindu culture. However, this does not mean that the people of Sholla adopted the Hindu beliefs. Though there is a small Hindu shrine, and some ceremonial elements were borrowed from the Hindu, most of the

29: Assam C-5 (1958) 1963 A87 Khasi A87

Regarding supply of foodgrains through fair price shops, the position appeared to be unsatisfactory. Complaints were heard from some villagers coming from the interior villages that they very rarely get rice from fair price shops, which are usually allotted to bigger villages, sometimes too far from the villages tagged to it. Even the people of the villages where there were fair price shops, complained that the supply of rice to these shops was inadequate and the price also was very high which in some areas was even as high as Rs. 2/-00 per maund.

In a majority of the villages investigated, water supply and medical facilities were not satisfactory. Malaria, dysentery and other bowel diseases are common in this area.

164 •

4.3 Incidence of diseases and medical facilities:

TABLE B-2

Incidence of diseases

Name of disease	No. of villages reporting incidence of disease		
	Border area	Project area	General area
(1)	(2)	(3)	(4)
(a) Malaria	6	8	8
(b) Dysentery	6	7	8
(c) Flu	7	7	6
(d) Kala-azar	1	0	0
(e) Leprosy	0	1	0
(f) Typhoid	1	0	0
(g) Pneumonia	1	0	0

N. B.—Number of villages surveyed—10 in border area, 8 in Project area and 10 in General area.

As the above table shows malaria and dysentery were of common occurrence. The scourge of malaria was, however, reported to be most severe in the border areas, the hill slopes of which provided suitable breeding ground for mosquitos. Next to malaria, dysentery and other bowel diseases have widespread prevalence in the district. The high incidence of these as well as various skin diseases are mainly accounted for by a lack of good water supply. Leprosy and kala-azar were reported only from one village each (Byrbeh and Sheila respectively).

CHAPTER—X

Summary of main findings

125 10.1. Twenty-eight villages were selected for the purpose of the survey. Out of the 28 villages selected, 10 from Border area and 8 from Project area were selected purposively while the remaining 10 were selected at random from the entire district which is referred hereafter as general area.

166 Migration from big villages was rare but some migration was reported in respect of small villages.

164 Occurrence of Malaria, influenza and dysentery is a regular phenomenon in the area. Medical facilities were not found satisfactory and as much as 78 per cent of the villages have no dispensary within a radius of five miles. In regard to education, the facilities cannot also be said to be unsatisfactory for more than 60 per cent of the villages have a Lower Primary School. Transport facilities were not satisfactory and as much as 60 per cent of the villages still depend upon primitive mode of transport, namely head load. Correlated with outmoded form of transport, is the prevalence of unduly high cost of transport.

162 10.2. The number of the families covered by the survey was 1006 in the Border area, and 647 in the Project area and 184 in the General area. The average size of a village in the respective area is 100·6, 80·9 and 18·4 families. In the Border and Project areas females out number males being respectively 1076 and 1092 females per 1,000 males as against 940 females per 1,000 males in the general area Literacy is as high as 34 per cent in the border area and 31 per cen in the Project area but as low as 17 per cent in the general area In all the areas literacy among females is very low.

162 The working population (earners and earning dependents) is as high as 55 per cent in the Border area, 54 per cent in the Project area and 63 per cent in the general area. While there were no cases of unemployment in the Project and General areas, 53 persons were reported unemployed from border area.

241 10.3. 51 per cent of the families in Border area are wholly agricultural, 35 per cent partly agricultural and 14 per cent independent o agriculture. The corresponding figures for the Project area are 61, 31 and 8 per cent respectively while for the General area they are 70 per cent, 29 per cent, 1 per cent respectively.

Predominantly agricultural families constitute 67, 76 and 90 per cent of the families in Border, Project and General areas respectively.

162 10.4. 31 per cent of the families in Border area, 29 per cent in Project area and 10 per cent in General area were absolutely without any land while 35 per cent, 39 per cent and 24 per cent of the families in the respective areas possessed small holding ranging from 0·14 to 2·30 acres representing 11,34 and 26 per cent of the total holding area in the respective areas. 36 per cent of the families in Border and Project areas and 41 in General area possessed medium sized holding (3 to less than 10 acres)

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

132 in 1876, the highest maximum temperature was registered in the month of August, the lowest minimum in January. From November until the end of March the weather is dry and bracing. Hoar-frost lies upon the ground almost every morning in the months of December, January, and February. Shallow water occasionally freezes over, but snow never falls.

The rainfall at Cherrá Púnjí is enormous, varying between 300 and 500 inches per annum. The heaviest fall is in the months of June and July. As much as 30 inches has been collected in one day in July, and 157 inches has been registered as the total rainfall of that month. The average rainfall of the three years ending in 1876 is returned at 368·41 inches. It is affirmed that a total of 805 inches fell in 1861, of which 366 inches is assigned to the single month of July. This excessive rainfall can be readily accounted for by the abrupt manner in which the hills at Cherrá Púnjí rise from the plains on the south. The vapour-bearing breezes of the south-west monsoon, sweeping across the heated, flooded plains of Lower Bengal, suddenly strike against the hills. The vapour as it ascends gets condensed into fogs and mists, and finally, when it reaches the crest of the range, discharges itself in torrents of rain, unequalled by that recorded in any other part of the world.

At Shillong, which is only 30 miles north and a little higher than Cherrá Púnjí, the average rainfall is only about 85 inches; but between these two Stations three higher ranges intervene, which deprive the clouds in passage of a considerable portion of their moisture. During the three years ending in 1876, the average rainfall at Shillong was 83·65 inches.

The rainfall at Jowái, a subdivisional Station in the Jáintiá Hills, 26 miles distant from the plains, holds a mid place between that of Cherrá Púnjí and Shillong, and is estimated at 150 inches in the year. During the three years ending in 1876, the average rainfall at Jowái was 145·62 inches; but in the last of these years alone as much as 309·21 inches was registered, of which 134·34 inches fell in the month of June.

133 The District is liable to shocks of earthquake. In September 1875 considerable damage was done to the houses in Shillong by a shock which extended with great severity as far as Gauhátí; and several minor shocks were experienced in the year 1876-77.

164 132 DISEASES, ETC.—Generally speaking, the climate of Shillong is pleasant and congenial to Europeans. English children thrive

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

remarkably, and there are few indigenous diseases of any kind. 164
Malarious fevers of local origin are unknown, and cholera never 132
prevails in the Hills except when directly imported from the plains. Notwithstanding the excessive rainfall, the climate of Cherrá Púnjí also is pleasant and salubrious. The rainfall is confined in great part to the five months from May to the end of September. For the rest of the year the weather is mild and very equable, and in the winter months almost pleasanter than that of Shillong.

Small-pox is the chief scourge amongst the Khásiás. The faces 164
of more than half the people are seamed by the marks of this disease. Strenuous efforts have recently been made to introduce [751]
vaccination, and with some success. Within the past three years nearly 5000 children have been vaccinated. The number of [648]
vaccinations in 1876 was 1309, as compared with 1628 in the preceding year.

Dysentery and bowel complaints generally prevail to a considerable extent; and, as at most other hill stations in India, the English residents at Shillong occasionally suffer from these diseases. Disorders of the liver are also not uncommon, usually affecting persons who have recently arrived from the plains, probably from unhealthy localities. When they have once passed through a short period of acclimatizing indisposition, most English residents at Shillong enjoy excellent health.

The *tardi* country lying along the foot of the Hills, especially on the northern side, is extremely malarious; and people passing through, especially pedestrians who travel without comforts and expose themselves to great fatigue, contract remittent fevers and agues of a severe type.

EPIDEMICS.—The following is a brief notice of some recent 731
epidemics. Cholera made its appearance in the Hills in May 1869, travelling from the direction of Jáintiápur, on the borders of Sylhet. It only showed its presence by a few sporadic cases from time to time until the 11th July, when the disease broke out in an epidemic form among the police and in the jail. The police and the prisoners were at once moved into camp, and communication restricted as much as possible. These precautions probably had the effect of preventing the spread of the disease at Shillong. The epidemic lasted a week; it attacked twenty-four persons, of whom fifteen died. From Shillong the disease travelled southwards, the people deserting their villages as the plague broke out. In the

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

731 pre-eminently filthy villages on the Cherrá Púnjí plateau the epidemic appears to have found a fitting home, for it stayed among them for a period of nine weeks and a half. The civil surgeon reports the deaths at Cherrá Púnjí and the surrounding villages to have amounted to about 175 out of a total of 232 cases. During the year 1876-77 hooping-cough and small-pox were prevalent in an epidemic form. In the Jáintiá Hills small-pox is stated to have caused 47 deaths, chiefly during the months of June, July, and August. Some fatal cases of hooping-cough occurred among the Khási children in the village of Máokhar, near Shillong. The only two cases of cholera reported were in the Jáintiá Hills.

16 VITAL STATISTICS.—A general system of registration is not [659] attempted throughout the Khási and Jáintiá Hills District. Statistics [648] of births and deaths are only collected among the inhabitants of the Stations of Shillong and Cherrá Púnjí, and in the selected area in the vicinity of Jowái, which comprises the following seven villages: —Jowái, Nongbah, Nartiang, Mynsau, Amwí, Ralliang, and Shámpúng. This selected area has a population of 12,504. Each village forms a distinctly-circumscribed community, in which the statistics are readily ascertained and reported by the *dolloi* or head-man. The returns may be regarded as extremely close to the truth, both for births and deaths; and they thus furnish an approximate statement of the health of the entire Hills. In 1874 the total number of deaths in the selected area was 351, showing a death rate of 28 per thousand; the number of births was 431, or 34·4 per thousand. The total population of all the places in which vital statistics are collected is 15,458 persons, among whom 428 deaths were recorded in 1874, showing a death-rate of 27·6 per thousand, as compared with 27·3 per thousand in the preceding year. The deaths were thus distributed—24 from cholera, 296 from fever, 38 from bowel complaints, 2 from snake-bite or wild beasts, and 68 from all other causes. The mortality from fevers was the highest recorded throughout the entire Province. On this the civil surgeon observes:—'There are few local sources of malaria in the Hills. Many of the deaths from fever were probably due to typhoid, induced by the use of impure water and by the filthy state in which the 312 people live. There is no attempt at conservancy in a Khási village. In Jowái, a good specimen of the class, the lanes and pathways are 364 strewn with excrement and house refuse. Drinking water is got • 164 from wells in the heart of the village, fed by the drainage of the

20: Hunter G-4 (no date) 1897 AR 7 Khasi AR 7

312

surface soil of the hills upon which the houses are built.' Cholera is attributed to importation from the plains. 364 [164]

SANITATION.—It has already been stated that the ordinary Khási villages are absolutely destitute of any conservancy arrangements. The sanitary condition, however, of the Station of Shillong is described as 'good.' The natural drainage is excellent. Drinking water is obtained chiefly from hill streams, and on the banks of these streams conservancy regulations are enforced. The water is conducted into the town by means of an artificial water-course. Public latrines have been erected at suitable places inside the town. The staff of sweepers and *beldárs* keeps the roads and drains clean, and the surface generally free from pollution. The sanitary condition of the cantonment is reported to be very good.

CHARITABLE DISPENSARY.—There is one dispensary in the Khási and Jáintiá Hills—at the Station of Shillong. It was first opened in 1872, and considerable additions have since been made to the building. During 1874 a total sum of Rs. 775. 8, or £77, 11s., was expended on new constructions and repairs, towards which the European residents subscribed Rs. 329. There is now accommodation for 10 male and 3 female patients. In that year the total number of in-door patients treated was 44, of whom 9 died, giving a death-rate of 20·45 per cent. The number of out-door patients was 529, or an average daily attendance of 7·8. Of the grand total of patients of both classes, only 31 were females. The largest number of cases are classified under the headings of fevers and constipation and colic. The total income during the year was Rs. 1598. 13. 9, or £159, 17s. 8d., of which Government contributed Rs. 300 for salaries, and an additional Rs. 300 as a special allowance. The European subscriptions amounted to Rs. 869, as compared with Rs. 33 subscribed by natives. The total expenditure was Rs. 1187. 15. 6, or £118, 16s., leaving a balance in hand of Rs. 410. 14. 3. The chief items were Rs. 480 for salaries of medical subordinates, Rs. 160 for servants' wages, and Rs. 222 for dieting of sick. There were 53 minor operations performed during the year. 743 [164]

The people of the District have no system of medicine of their own, and no native practitioners. Their sole remedies consist in divination and incantation. The only indigenous native drugs are chireta and wormwood. As stated in a previous paragraph, a small cinchona plantation was established by Government at Nongklao in 1867. 755 278 648 654

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

It may perhaps be ascribed to the pre-eminence
accorded by the Khasis to the female sex that successive 162
censuses have shown that the women of this race
considerably exceed the men in number. According
to the census of 1901, there are 1,118 females to every
1,000 male Khasis. This excess, however, is surpassed
by that of the Lushais, 1,191 to 1,000, and it may
possibly be due to the greater risks to life encountered
by the men, who venture far into the plains as traders
and porters, while the women stay at home. Habits of 165
intemperance, which are confined to the male sex, may
also explain a greater mortality among them.

It would be interesting to investigate the effect 161
on reproduction of the system of matriarchy which 163
governs Khasi family life. The increase of the race is
very slow. In the census of 1891 there were enumerated
only 117 children under 5 to every hundred married
women between 15 and 40, and in 1901 this number fell
to 108. It has been suggested that the independence
of the wife, and the facilities which exist for divorce,
lead to restrictions upon child-bearing, and thus keep
the population stationary. The question might with
advantage be examined at the census of 1911.

The next characteristic of the Khasis which marks 787
them out for special notice is their method of divination 782
for ascertaining the causes of misfortune and the
remedies to be applied. All forms of animistic religion
make it their chief business to avert the wrath of the
gods, to which calamities of all kinds—sickness, storm,
murrain, loss of harvest—are ascribed, by some kind of
propitiation; and in this the Khasis are not singular.
But it is somewhat surprising to find among them the 787
identical method of *extispicium* which was in use among 171
the Romans, as well as an analogous development in
the shape of egg-breaking, fully described by Major
Gurdon (p. 221), which seems to have been known to

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

249 648 65 at Dárjiling, who reported unfavourably on them. They have since been made over to the Siem of Nongklao, who is responsible for their being kept clear of weeds and protected against fire. Up to the close of 1875–76 the total expenditure had been Rs. 672, or £67, 4s. 0d.

136 FERÆ NATURÆ.—Tigers, elephants, rhinoceros, buffaloes, *mithuns* or wild cows, bears, leopards, wolves, jackals, foxes, wild hog, and several kinds of deer abound in the Khásí and Jáintiá Hills. The [224] [648] expense of keeping down tigers in the shape of Government rewards amounted to £44, 10s. 0d. in 1869-70. The rate of reward now paid is Rs. 25 or £2, 10s. 0d. per head. No rewards have ever been given for the destruction of venomous serpents. The number [165] of deaths from wild beasts and snake-bite reported to the police amounted to 28 in 1866-67, 18 in 1867-68, 16 in 1868-69, and 26 in 1869-70. The small game found in the Hills consists of black partridges, hill partridges, quails, ducks, teal, snipe, and woodcocks. 226 The *mahsir* fish is caught in the rivers. No regular trade is carried 439 on in the skins of wild animals; and, except in the case of wild elephants, the *feræ naturæ* are not made to contribute towards the wealth of the people.

224 ELEPHANTS.—Wild elephants are found in the lower ranges of the hills, and in the gorges opening on the valleys of the Surmá and 648 the Brahmaputra. Each State in the Khásí Hills and each dolloi- 651 ship in the Jáintiá Hills constitutes a separate hunting circle or *mahál*. In the Khásí States the conditions of elephant hunting are governed by rules framed in 1874-75 by the Chief Commissioner, and approved by the Government of India. These rules provide, (1) that the British Government will make no claim to royalty on account of elephants caught in the Khásí Hills; (2) that one half of the proceeds of the sale of each elephant caught shall be paid over to the chief whose State forms the *mahál*, and the other half retained by Government; (3) that if a chief wishes to hunt elephants on his own account, the *mahál* composed of his State shall be reserved from sale, and a special arrangement shall be made with him on the basis that half the proceeds of the hunting shall accrue to Government. A special form of hunting licence in accordance with these rules has been settled by the Chief Commissioner. In the Jáintiá Hills, as being British territory, the ordinary Assam rules are in force, in accordance with which leases of the *mahál*s are sold at intervals of two years to the highest bidder at

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

613 formed independent descent groups by individual households, for
614 which no traceable genealogical relation with any other descent groups
621 could be established, though some of them belonged to the same *kur*. In Sohkynduh, the total 48 households were divided into 16 *kur* (according to the house-owner), and in Kongton, the total 62 households were divided into 9 *kur*, while the number of actual descent groups amount to 31 in Sohkynduh and 41 in Kongton.

166 This fact, I presumed, indicated a considerable mobility of the
178 population of each village community. Hence, I tried my best to
613 reconstruct the historical alignments of these descent groups, both from my genealogical data and with the help of the villagers' memory.
614 The result showed that the mobility of the population over the last fifty years had been surprisingly great and complex. In Sohkynduh,
621 the Praian clan seems to be the oldest inhabitants of this village with 16 *kur* segments. Next came a family of the Ksing. The third wave was a family of Khonglam, and the fourth, Siem Lyngngoh which I mentioned previously (p. 104). The next were families of the Kynshah, many members of which had left for Nonprian village after a few years. The sixth wave was the Srieh family. All the above movements took place before the great earthquake of 1897 which shook Assam. After 1897 the movements became more intense and complicated, and involved many families of various *kur*. The villagers could not remember the order in which they came: there has been continual coming and going even up to now. At present, the Prarian, the Ksing, the Khonglam, the Kynshah and the Dkhar are the older among the 16 *kur*. However, such migrations concern usually a single family only, not a group of *kur*, and that is the typical pattern of Khasi migration. Hence, families which have the same *kur* name do not always indicate the same movements. The incentive for such migration seems to be to get land better appropriated to one's economic condition. Particularly, as I have already mentioned elsewhere (p. 105), the shortage of land seems to encourage families of elder sisters who have no share of property, to move to other areas and look for land.

Thus, many households which make up the present village are minor segments of different *kur*, or of the same *kur*, but they can hardly trace their genealogical relations to one another. A migration to a new village was not undertaken at random; it was mostly as a result of information received from neighbouring villages, or from
178 those where friends or relatives had already settled in. Several neigh-
613 bouring villages usually dispose of more than one common market where they can exchange information and developed friendships over
614 trading. The matrilineal kinship relation is no more important a
621 factor than any of the others mentioned above. Among the Khasi,

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

some clerical work. However, such instances are very rare in these regions and few Christians are to be found among the people. So far as my genealogical table accounts for, only two boys from Sohkynduh, and one girl and one boy from Kongton, left for Shillong, and married there. In contrast to these exceptional cases in these villages, in the upland Khasi Hills, there are considerable changes in the composition of a village with high geographical and social mobility of population because of the spread of Christian education and urban influence.

The people of the two villages say that marriages with outside people were not formally practised, and were only a recent tendency. However, the composition of the population of the two villages showed extensive movements of population in the past (not to urban areas, but from village to village). Such movement is attributed mostly to migration by a family rather than by an individual on marriage. This type of migration is clearly found also in the process of the formation of Jatinga village (see Appendix, Jatinga).

The composition of the village community and the social characteristics of Sohkynduh and Kongton show very similar features of village endogamy. They seem to be typical of the traditional pattern of Khasi villages. Village endogamy is the intrinsic pattern among the Khasis. This fact can be also observed to a considerable degree in Shella and Jatinga.

[P. 116 is blank]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

592 he clearly maintains the label of his descent group, he is at least
593 divorced from them economically. If a father's activities were such
613 as to permit the accumulation of wealth to be handed over to the next generation, he is always remembered with great respect and admiration by his successors and by the descendants of his wife's matrilineal line. In such a case he is looked upon as a member of his wife's descent group rather than of his mother's descent group. The best examples of this are the cases of men belonging to the first generation of Jatinga villagers, especially that of the founder of
[166] Jatinga. These immigrants to Jatinga mostly accompanied their wives, who were not heiresses (as I mentioned previously, the unit of Khasi immigrants is mostly found in this kind of a couple); and most of them established successful matrimonial life with paternal authority, having been freed from the gravity of both matri-kin of wife as well as of husband.

Not necessarily confined to such cases of immigrants, even in an ordinary situation, if husband is ready to devote himself for his wife and children, the matrimonial life mostly turns happier and well established one. For under the Khasi matrilineal system, a wife, if she is not the heiress, is normally oriented to develop surprisingly high degree of independence from her descent group, i.e. her natal *iing*, unlike women of other matrilineal societies. This fact is closely related with the unique structure of the *iing*, as already discussed.

As a woman (non-heiress) tends to keep a certain distance to her natal *iing*, her brother accordingly decreases his concern to her new household. The pressure of the authority (wife's maternal uncle or brother) of wife's natal *iing*, on such a household becomes less marked. The wife's brothers are members of her natal *iing*, not of her new established *iing*, and therefore none of them can act as an authority over her new *iing*, though they may exercise certain pressure on the sister's husband, since the sister who established the new *iing* still keeps her membership in her natal *iing*. In fact a husband actually feels pressure from his wife's brothers; the occasional visits of the authority of her natal *iing* exercise a psychological check on his whole control over her and his children. Should any serious mischance occur in the marriage, the wife will run to her brother for consultation. Furthermore, as member of her natal *iing*, he has the right to demand the property acquired by him if his wife has no successor, since it automatically belongs to his wife unless he acquired it without cohabitation with her, or through the capital of his *iing*. However, the process of segmentation in the *iing* leads the wife to greater attachment to her husband, particularly when his economic contribution is important, and as a consequence weakens her ties with her natal *iing*.

613 The limited rights of the brother over his sister's (non-heiress)

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

field work as well as on the accounts of various matrilineal systems, I feel strongly that there must be different types of systems which may be distinguished as "household-lineage" and "segmentary-lineage". Fortes and Eggan postulate the pre-eminence of the descent principle over residence. Though this may be the case among the Ashanti and the Hopi, it does not fit the cases belonging to what I call "household-lineage" type. Firth's argument emphasizing the importance of rights to group membership being associated with locality, fits very well with the latter case. With more precision and subtilty than Kroeber, he argues that "residence by itself does not give title to descent-group membership, but land rights established by descent-group membership tend to remain operational only through residence" (Firth 1957, p. 7). 000

I believe there are crucial differences between these household-lineage type and segmentary-lineage type organizations. The technical *process of fission into segments is similar* in both types. But in the former, once a segmented group attains autonomy, the relation between the segments will easily be forgotten after a few generations, as it has no significant social implication. Among these societies, people's genealogical memory outside the residential group is surprisingly poor. This empirical fact also suggests a different structure from that of the segmentary system.

In both types of society the internal organization of a household is the same, but it differs externally. Eggan states that "Kroeber's and Parsons' statements about the lack of system in regard to Zuni kinship indicate judgement from some arbitrary standard" and adds "The concept of the lineage provides a bridge between the household and the clan" (Eggan, *ibid.*, p. 197). I cannot agree with this. In fact, my study of the Garo, the Khasi and the Nayar corresponds very well to the Zuni situation described by Kroeber and Parsons. There are matrilineal systems which lack a bridge between the household and the clan. K 9 171 182

Then what is it that makes the difference between the two types of organization in similar unilineal systems? I am not sure that I can produce at present effective hypotheses on this issue. However, empirical facts show that the household-lineage type organization is likely to be found among more complicated societies or in a society with considerable mobility. This we gather also if we compare the village compositions of the Hopi and the Zuni. In the case of the Khasi, we saw that there was considerable mobility in population even in remote villages, so that we easily understand that in such a condition lineage membership hardly maintained itself. This seems to agree with the view put forth by Fortes on segmentary systems. Fortes says the limits of the spread or span of internal segmentation of the 592 613 K [166] 000

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Shella

Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards along the steep slope, looking down towards the Bengal plain. The climate of this part of the hills is considered to be one of the worst in tropical India for human habitation. The Bengal plain, though warmer than this area, is considered more healthy. This border land is the zone of malaria, typhoid, black fever, cholera, etc. None of the Bengalee peasants dare to live in such an area. However, it is the most fertile for products such as betel-nuts, pan-leaves, oranges, bananas and pineapples, and it also produces limestone. These people seem to prefer to settle in this zone and to enjoy its prosperity, at the expense of human lives: every year, especially between March and September, the inhabitants suffer from various fevers and dysentry and other diseases, many of the weaker facing death. 131 132 164 433 164 648

Before the Partition of India and Pakistan, the products of Shella were carried down the Shella River to Sylhet, one of the biggest centres in East Bengal, which brought unimaginable wealth to the Shella people. Their houses were built by carpenters from Sylhet. The style and structure of these houses were exceptionally elaborate for the Khasi. They purchased vast rice fields in the plain, which used to be cultivated by Bengalee and Garo labourers engaged by them. These Khasi do not themselves know how to cultivate rice fields; they have always been managers or landowners. Their boys used to be sent to high schools and colleges in Sylhet. As a result of their trading with the Bengalee, many of them read and speak fluent Bengalee. There is no difference between their style of clothing and that of the Bengalee, though the women maintain their traditional dress in the Shella style. 177 178 434 [439] [342] [166] [464] [871] [191] [291]

They have thus been distinguished from the rest of the Khasi not only geographically, but also economically and culturally. Their personality also differs sharply from the rest of the Khasi. They are very sociable, and quick, a quality lacking among the Khasi of Sohkynduh and Kongton. They are clever enough to deal with strangers. The upland Khasi say Shella people are very cunning. This remark shows one side of these people. They had to be cunning, since they traded with the Sylhet Bengalee who were said to be the most cunning of their race. Their role in the trade and in the history of the modernization of the Hills was considerable. For centuries they represented intellectual Khasi owing to their contact with Hindu civilization, while the Hills remained in darkness. They assumed an important role when the British established an administration in the Hills, and even up to now, many leading Khasi originated from this area: for instance, Lati Hat, the first interpreter of the British Headquarters at Cherrapunjee; Jeebon Roy, who was the first Magistrate among the Khasi; Maham Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jeebon Roy); Nichols Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nichols Roy), Principal of the Gauhati University, etc. 157 184 648 177 178 [439]

Through constant cultural contact with Hindu, and encouraged by their economic prosperity, the Shella Khasi, like the Jaintias, have been much influenced by Hindu culture. However, this does not mean that the people of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, and some ceremonial elements were borrowed from the Hindu, most of the 177 648 771 795

621 [Jatinga]

[175] This village was founded in 1905 by Khasi immigrants from the Jaintia Hills.
[101] At the entrance of the village, a bust of the founder, Lakhanbang Suchiang,
[211] stands facing towards the east; it was erected on the occasion of the celebration
[346] of their Golden jubilee, in November 1955. Houses are scattered along the
[771] ridge of the moutain to the east and to the west; in the centre is the church. All the inhabitants are Christians. Before the Partition this was one of the most modern and prosperous villages in Assam.

Jatinga provides a very interesting instance of the Khasi 'colonial' village.
101 It is surrounded by villages of the Kuki, of the Zemi-Naga, and of the Cacharee,
121 who constitute the main population of the North Cachar Hills, and who are
621 tribes entirely different from the Khasi, in economy, social organization, language and culture. Therefore, Jatinga is like an island of Khasi community. I took this village as one of my fields, because I was particularly interested to discover how far the Khasi matrilineal organization is kept up in a community thus situated, surrounded by patrilineal tribes, and considerably modernized by Christianization and economic prosperity; and I was also interested in the process of formation of a new village, in comparison with Rimsibara and Joshipara in the Garo Hills.

Formation of the Present Population of Jatinga.

The first immigrants to Jatinga.

101 The main population of Jatinga, including the founder, originated in Bataw
166 village in the Jaintia Hills, twelve miles away from Jaintiapur, the capital of
175 the then Jaintia Rajas. This village is situated on the border of the Jaintia Hills and the East Bengal plain, the location being very similar to that of
621 Shella, as are their culture and economy. In the later part of the nineteenth century, some members of Bataw village moved to Borkhala, ten miles from Silchar, one of the biggest villages of the then Cacharee king.

These immigrants who came to Borkhala stayed there about fifteen years before they came to Jatinga. Kloribon, the first daughter of the founder's sister was born there. In November 1905, some Christian Khasi left Borkhala for Jatinga, acting on information gathered from a Welsh Mission at Haflong, that the land of present Jatinga was fertile and fit for their cultivation. They
166 were the first immigrants to Jatinga. The Government record names the following three persons as the first immigrants to Jatinga: Suchiang Lakhanbang,
551 Tariang, and Suchen Munik. In fact, according to the data which I collected
614 at Jatinga, Suchiang Lakhanbang was accompanied by the following persons (the names in brackets indicate the clans):

621 his wife, Misibon (Phanwar).[1]
175 his brother, Pryntah, and Pryntah's wife, Sintu (Rupsi).
his sister, Laptho, and Laptho's husband, Munik (Suchen) with their daughter, Kloribon, and Munik's younger brother, Sain.
his friend, Tariang.

Soon after their settlement, Sain, the brother of Munik, brought his wife Tahin (Suiam) from Jaintia. Misibon brought her younger sister, Dissibon. Tariang who came with Lakhanbang afterwards called his wife, Palong. But having spent some time there, they left eventually for another place, so that

1. Misibon was a native of the Cherrapunjee area of the Khasi Hills (not of Jaintia like the others). She was a school teacher at Cherrapunjee, and later became a teacher at a school near Jaintiapur, where she married Lakhanbang.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

there are none of their descendants in Jatinga. Summing up, the first party who settled at Jatinga was composed of people of the following five clans: 166

1. Suchiang — Lakhanbang, his sister, Lapthe, and her daughter, Khorthon, his brother, Pryntah. 551
2. Suchen — Munik and his younger brother, Sain. 614
3. Phanwar — Misibon and her younger sister, Diasibon. 621
4. Rupsi — Sintu, the wife of Pryntah. 175
5. Sulam — Tahin, the wife of Sain.

Among them, Suchen had no female member. Phanwar had no successor. Misibon had no issue and Diasibon did not marry. Therefore, Suchiang, Rupsi and Sulam are the oldest clans in present Jatinga. Suchiang and Rupsi especially are the dominant and richest groups among the present population.

This was the time when the railway from Gauhati to Silchar was being constructed. Some Khasi labourers were working at Haflong on the construction of the railway. After the foundation of Jatinga, these Khasi workers established marriage relations with the Khasi of Jatinga, and finally, upon completion of the railway, many of them became the inhabitants of Jatinga. The present members of the Dome and Siangshai clans are the descendants of these people, and they form a considerable number of the present inhabitants of Jatinga. Besides them, there were a few other Khasi at Haflong who were engaged in trading business. In the course of time, they also had marital relations with Jatinga people and came to Jatinga. 166 175 458 621 [499] [464]

After five years had elapsed they found that in spite of their hard work the land was not favourable to them. Many of them left Jatinga. This was the hardest period of Jatinga history.

The second migration (1919-1925).

The railway which once had been blocked was reopened in 1919. The people who had left Jatinga came back to settle there. This time the circumstances seemed to them quite favourable. The pan trees which they had planted earlier were growing and they could gather considerable produce. The village grew bigger around 1920 as a result of new immigrants from Jaintia; most of them were people from Bataw, the village of the founder. In this period, many immigrants came from Jaintia not only to Jatinga but also to Sylhet, Borkhala and other places outside the Khasi-Jaintia Hills. It seems that by this time the over-populated Jaintia realised that these areas were favourable for their new home. However, the successive waves of Jaintia immigrants to Jatinga ceased by 1925, its population having reached saturation point. [499] [245]

Orange production brought economic prosperity to the people of Jatinga. Wealthy villagers employed temporary labourers from the Jaintia Hills every year. Some of these labourers came with their families and others came individually. During their stay at Jatinga, some of them married and settled there. Hence, there are also descendants of such labourers among the present inhabitants of Jatinga. [245] [464]

Some Aspects of Descent Groups.

Throughout the history of Jatinga, immigrations have always been undertaken by a family (elementary family, siblings) or by an individual, but never by a group of clan members. Therefore, the present population is grouped in small descent groups according to each migration. Though some of them happened to have the same clan name, their history of migration and their 621 [175] [614] [166]

CHAPTER—X

Summary of main findings

125 10.1. Twenty-eight villages were selected for the purpose of the survey. Out of the 28 villages selected, 10 from Border area and 8 from Project area were selected purposively while the remaining 10 were selected at random from the entire district which is referred hereafter as general area.

166 Migration from big villages was rare but some migration was reported in respect of small villages.

164 243 871 499 780 Occurrence of Malaria, influenza and dysentery is a regular phenomenon in the area. Medical facilities were not found satisfactory and as much as 78 per cent of the villages have no dispensary within a radius of five miles. In regard to education, the facilities cannot also be said to be satisfactory for more than 60 per cent of the villages have a Lower Primary School. Transport facilities were not satisfactory [illegible] per cent of the villages still depend upon primitive mode of transport, namely head load. Correlated with primitive form of transport, is the prevalence of unduly high cost of transport.

162 161 10.2. The number of the families covered by the survey was 1000 in the Border area, and 647 in the Project area and 184 in the General area. The average size of a village in the respective area is 1006, 829 and 184 families. In the Border and Project areas females out number males being respectively 1096 and 1002 females per 1,000 males as against 948 females per 1,000 males in the general area. Literacy is as high as 34 per cent in the border area and 31 per cent in the Project area but as low as 17 per cent in the general area. In all the areas literacy among females is very low.

213 [362]

162 464 The working population (earners and earning dependents) is as high as 55 per cent in the Border area, 54 per cent in the Project area and 63 per cent in the general area. While there were no cases of unemployment in the Project and General areas, 13 persons were reported unemployed from border area.

241 162 463 10.3. 51 per cent of the families in Border area are wholly agricultural, 35 per cent partly agricultural and 14 per cent independent of agriculture. The corresponding figures for the Project area are 61, 31 and 8 per cent respectively while for the General area they are 98 per cent, 29 per cent, 1 per cent respectively.

Predominantly agricultural families constitute 67, 76 and 90 per cent of the families in Border, Project and General areas respectively.

162 423 10.4. 31 per cent of the families in Border area, 35 per cent in Project area and 10 per cent in General area were absolutely without any land while 35 per cent, 30 per cent and 24 per cent of the families in the respective areas possessed small holding ranging from 0·24 to 2·50 acres representing 11,34 and 36 per cent of the total holding area in the respective areas. 36 per cent of the families in Border and Project areas and 41 in General area possessed medium sized holding (3 to less than 10 acres)

N. B.—1951 census population figures are not shown against Border Area and Project Area villages. This is because of the fact that in some cases in the Census report, the different blocks of a village have been enumerated as different villages, *e.g.*, the village **Sohkha** has been enumerated in 1951 census as three villages, *viz.*, **Sohkha Phlang, Sohkha mission**, etc., while in some other cases, only one population figure has been recorded against a number of villages of which possibly one is the main village, others being its satellites and as these villages were selected without any reference to the **Census Handbook**, there is every likelihood of our selected villages not coinciding with **Census** villages. So far as migration is concerned it is **very** rare in big villages, particularly when they have some settled occupation but it was found through investigation that in some of the border villages due to continued adversities in their agricultural and other occupation people had to move away in search of work. Migration of some traders was reported from **Bholaganj** and **Lyngkhat**. Some **Khasi** families were reported to have migrated to **Pakistan** where they had got agricultural land. Heaviest emigration of this type was however, reported from **Sohkha**, a village located from **Saipung-Darrang, M. P. C. D. Block**, but located near the **Indo-Pak Border**, where about **one third** of its **total** population was said to have migrated to **Pakistan**. Some families from **Mawdon** are said to have migrated to a nearby village due to unhealthy condition of the village. A study of population variation in **General area** villages given above, will show that there is **a net decrease of 20 persons** in the sample villages from **total number of persons recorded** in **1951 Census**. This is accounted for by migration of people which is considerable in smaller villages particularly those depending on **shifting** cultivation. A few families from **Mawlaiteng** are said to have migrated to **Mawlum** a village **only a** few **furlong** away from **Mawlaiteng**. Migration was also reported from **Lawyriang, Dawsya, Asola**, and **Jowa** from **Byhuh** and **Mawkyrshiw** a few families were said to have left the village a few days ahead of the **date of** investigation for their cultivation at some distant place.

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

361 In the interior of the Hills the largest villages are mere clusters of
463 huts. The great majority of the inhabitants are employed in agriculture, but there are no data upon which a proportion of agriculturists to non-agriculturists could be based.

167 There is no immigration into the District. Both the Khasis and
198 the Syntengs have been successful in preserving to the present day their primitive isolation, free from the interference of Hindoism. They still maintain their aboriginal forms of belief and religious worship, and repudiate alike the authority of Brahmans and
[771] the entire system of castes. To some extent, however, they have
[262] given way to Hindu prejudices in the matter of purity of food. The few Hindus to be found in the Hills are temporary residents, en-
[563] gaged in civil and military employ, who always contemplate returning to their own homes. The traders are for the most part natives of the
[441] Hills; for the Marwari merchants, who penetrate into every other corner of Assam, have been able to obtain no footing in the face of Khasi competition. There is likewise no emigration from the District. The hillmen are a well-to-do and contented race, and either produce themselves or obtain by trade sufficient to satisfy
• [166] their scanty wants. A certain number of both Khasis and Syntengs proceed southwards every year to work on the tea gardens of Cachar and Sylhet, but such absences from home is only temporary.

243 AGRICULTURE: RICE.—Thirteen different varieties of rice are cultivated in the District, of which the following is a list, giving the Khasi name as well as the description of the grain:—(i) *U-dyke-khyrwiew* (*u*, the masculine article, meaning 'the,' and *dyke*, noun masculine, meaning 'paddy'), brown rice with long grain; (ii) *u-dyke-khyrwiew-dwitik*, a whitish rice with long grain; (iii) *u-dyke-lo-tik*, round-grained rice; (iv) *u-dyke-kwai*, bearded, hooked; (v) *u-dyke-dew-de-ieng*, black hooked rice (literally *u* = 'the,' *dyke* = 'paddy,' *dew* = 'earth,' *de* = 'that,' *ieng* = 'black'); (vi) *u-dyke-de-lili*, white rice; (vii) *u-dyke-wiw*, scented rice (literally *u* = 'the,' *dyke* = 'paddy,' *wiew* = 'royal'); (viii) *u-dyke-de-kwak*, large-grained rice; (ix) *u-dyke-de-ieng*, small-grained rice; (x) *u-dyke-se-ka*, early rice; (xi) *u-dyke-ra-kan*, late rice; (xii) *u-dyke-ieng-la*, rice grown along with beans; (xiii) *u-dyke-de-lili*, small rice.

Rice is cultivated in marshy fields situated near running water as well as in high lands. The first seven of the above thirteen species of rice are sown in marshy lands during the months of April and May,

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

impossible to state, as it is to fix upon the exact tract of country from which the Aryans sprung. With reference to the Khasi branch of the Mon-Anam family, it would seem reasonable to suppose that if they are not the autochthons of a portion of the hills on the southern bank of the Brahmaputra, and if they migrated to Assam from some other country, it is not unlikely that they followed the direction of the different irruptions of foreign peoples into Assam of which we have authentic data, i.e. from south-east to north-west, as was the case with the Ahom invaders of Assam who invaded Assam from their settlements in the Shan States off the Patkoi range, the different Burmese invasions, the movements of the Khamtis and, again, the Singphaw, from the country to the east of the Hukong Valley. Whether the first cousins of the Khasis, the Mons, moved to their present abode from China, whether they are the aborigines of the portion of Burma they at present occupy, or were one of the races "of Turanian origin" who, as Forbes thinks, originally occupied the valley of the Ganges before the Aryan invasion, must be left to others more qualified than myself to determine. Further, it is difficult to clear up the mystery of the survival, in an isolated position, of people like the Bo-Mondas, whose language and certain customs exhibit points of similarity with those of the Khasis, in close proximity to the Dravidian tribes and at a great distance from the Khasis, there being no people who exhibit similar characteristics inhabiting countries situated in between; but we can, I think, reasonably suppose that the Khasis are an offshoot of the Mon people of Further India in the light of the historical fact I have quoted, i.e. that the movements of races into Assam have usually, although not invariably, taken place from the east, and not from the west. The tendency for outside people to move into Assam from the east still continues.

Appendix.

The late Mr. S. E. Peal, F.R.G.S., in an interesting and suggestive paper published in the *Journal of the Asiatic Society of Bengal* in 1886, drew attention to certain illustrations of

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

[Shella]

wife who lives with him. The Khasi woman lives with her mother. Some say the Khasi woman is his second wife, other say their marriage is not recognized by the public. 563

Actually, owing to the bad climate, very few non-Khasi live in this area. Besides the two non-Khasi just mentioned, there were a Bengalee tax collector and an Assamese Forest Officer, both of whom lived at Shella Bazaar. Bengalee villages are situated about five miles south of Shella. Except in the bazaar, Bengalee and Khasi have no social contact with each other, and intermarriages have been rare.

However, it is obvious that in the past the Khasi must have had many cases of intermarriage with Bengalee. Among the Khasi, there is a clan called 'Dkhar.' The term 'Dkhar' is also used for the peoples of the plains; Bengalee are called 'Dkhar' by the Khasi. They say that the Dkhar clan originated in Bengalee girls who married Khasi men and who went to live in the Hills. It is said that in other days, the Khasi often raided the Sylhet plain and kidnapped Bengalee girls as well as goods. In Bengalee records of Sylhet, Khasi appear as 'Bloody Khasi.' Khasi old men say that in order to increase their population they did sometimes kidnap Bengalee girls, but that they treated these girls very nicely and kindly, so differently from their own people. Since they follow the matrilineal system, they decided to name their descendants 'Dkhar.' It is said that all the present Dkhar people are descendants of such marriages. The Dkhar are found more on the southern slopes of the Khasi Hills i.e. among the Wars. 101 563

It seems there were many reasons for the descendants by marriage between the Khasi and the Bengalee to become Khasi. First of all, it is said that in the other days the Khasi wanted to increase the population by such marriages. At the same time, a Bengalee who married a Khasi became an outcast from his or her own society owing to the caste system, and this inevitably made them Khasi. Secondly, the Khasi were primarily grouped into the *iaing*, and they considered the marriage relation as of secondary importance. Hence it was rather difficult to remove by marriage a Khasi man or woman from their native place. Thirdly, Khasi could hardly live in the plain where no betel-nut or pan-leaf gardens were available; they could not engage in rice cultivation in the plain, as the technique is entirely different from the cultivation of betel-nut or pan-leaf. Moreover, they said they could not stand the heat in the plain. Therefore, the orientation of intermarriages was always towards the Khasi community: the Khasi brought outsiders to their own land; they did not themselves leave.

Such a marked tendency on the part of the Khasi to remain attached to their own homeland, is in no way contradictory with the phenomena of their migration to places outside the Khasi Hills, owing to the exploitation of their homeland and to the increase in population. The formation of Jaitinga represents such an instance; there are also the cases of modern Khasi women from sophisticated urban areas, who easily leave their homeland, after marriage with a non-Khasi, this also appears in the following data on Jaitinga. 161 167 [563]

JAITINGA

Jaitinga is a Khasi village situated in the North Cachar Hills, three miles east from Haflong, the headquarters of the North Cachar Hills. The number of households was about sixty in February 1956. Their economy depends on the pan-leaf, orange and pineapple gardens, similar to that of the Shella people. 131 621 653

thereafter, the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contracted that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, judging cases of heinous crimes, approving the popular selection of any new chief, and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life, and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Mills (n.d.): (1) The British introduced the potato, which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive specialization exhausted the soil and made for ever-poorer crops. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should inherit property that traditionally was earmarked for her performance of non-Christian religious rituals. (3) About 1864 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to marry with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the accelerated enrollments in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the Independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi-Jaintia Hills District became a Part B, or Autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The native-state system and the chiefs still exist, and the District Council finds it difficult to effect legislation which is neither offensive to regional customs nor a simple blueprint of ill-fitting all-India legislation. The major political schism of this time is between Jaintias, who are accustomed to centralized authority and taxation, and Khasis, who resist the notion of taxation to support the work of a central District Council. (Cf. Gait 1906, Aitchison 1931, Bhuyan 1948, Morris 1958.)

SETTLEMENT PATTERN AND HOUSING. Settlement pattern. Khasis live endemically in nucleated, nucleated, and emplanted villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a de-

175 619 648 [726] [651] [177] 177 648 [449] [439] [139] [737] [423] [635] [633] [167] [563] [423] [971] 641 642 [651] [563] [113] 361 [312]

439 East Pakistan to which the people in the border areas were entitled
648 in the strength of various trade agreements of the Government of
458 India with the authorities in Pakistan, were also scanty. The situation was still more aggravated due to the stringent measures adopted by authorities in Pakistan, on the plea of prevention of smuggling, in December, 1957 when the entire border trade virtually came to a standstill.

245 This chaos in border economy has resulted in widespread unem-
439 ployment among the border people. There being no market for the
458 produce, the owners ceased to take proper care of their orchards and
464 plantations. As a result thousands of labourers who were employed in the orchards were thrown out of employment. Similar was the condition of those who were employed in the transportation of various commodities such as merchandise of trade etc. A large section of the people engaged in collection of limestone were also rendered unemployed with the set back received by the trade in limestone with East Pakistan. Due to stoppage of trans-border trade, petty traders engaged in distributive trade, also suffered.

423 Many of the border people possessing paddy lands and orchards in
648 areas that are located in Pakistan had to abandon them. The following
458 table will show the amount of land lying in Pakistan belonging to the farmer in the selected villages of border area :—

TABLE A-2

N. B.—1951 census population figures are not shown against Border Area and Project Area villages. This is because of the fact that in some cases in the Census report, the different blocks of a village have been enumerated as different villages, *e.g.*, the village **Sohkha** has been enumerated in 1951 census as three villages, viz., **Sohkha Phlang, Sohkha mission**, etc., while in some other cases, only one population figure has been recorded against a number of villages of which possibly one is the main village, others being its satellites and as these villages were selected without any reference to the **Census Handbook**, there is every likelihood of our selected villages not coinciding with Census villages. So far as migration is concerned it is very rare in big villages, particularly when they have some settled occupation but it was found through investigation that in some of the border villages due to continued adversities in their agricultural and other occupation people had to move away in search of work. Migration of some traders was reported from **Bholaganj** and **Lyngkhat**. Some Khasi families were reported to have migrated to **Pakistan** where they had got agricultural land. Heaviest emigration of this type was however, reported from **Sohkha**, a village selected from **Saipung-Darrang, M. P. C. D. Block**, but located near the Indo-Pak Border, where about one third of its total population was said to have migrated to **Pakistan**. Some families from **Mawlum** are said to have migrated to a nearby village due to unhealthy condition of the village. A study of population variation in General area villages given above, will show that there is a net decrease of 20 persons in the sample villages from total number of persons recorded in 1951 Census. This is accounted for by migration of people which is considerable in smaller villages particularly those depending on shifting cultivation. A few families from **Mawhiteng** are said to have migrated to **Mawlum** a village only a few **Coloms** away from **Mawhiteng**. Migration was also reported from **Lamyriang, Domrya, Asola**, and **Jowe** from **Byrbah** and **Mawkyrkhiw** a few families were said to have left the village a few days ahead of the date of investigation for their cultivation at some distant place.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

361 In the interior of the Hills the largest villages are mere clusters of
463 huts. The great majority of the inhabitants are employed in agriculture, but there are no data upon which a proportion of agriculturists to non-agriculturists could be based.

167 There is no immigration into the District. Both the Khásiás and
178 the Syntengs have been successful in preserving to the present day their primitive isolation, free from the interference of Hinduism. They still maintain their aboriginal forms of belief and re-
[771] [262] ligious worship, and repudiate alike the authority of Bráhmans and the entire system of caste. To some extent, however, they have given way to Hindu prejudices in the matter of purity of food. The
[563] few Hindus to be found in the Hills are temporary residents, engaged in civil and military employ, who always contemplate returning
[441] to their own homes. The traders are for the most part natives of the Hills; for the Márwári merchants, who penetrate into every other corner of Assam, have been able to obtain no footing in the face of Khási competition. There is likewise no emigration from the District. The hillmen are a well-to-do and contented race, and either produce themselves or obtain by trade sufficient to satisfy
[166] their scanty wants. A certain number of both Khásiás and Syntengs proceed southwards every year to work on the tea gardens of Cáchár and Sylhet, but such absence from home is only temporary.

243 AGRICULTURE: RICE.—Thirteen different varieties of rice are cultivated in the District, of which the following is a list, giving the Khási name as well as the description of the grain:—(1) *U-kyba-khyuriew* (*u*, the masculine article, meaning 'the,' and *kyba*, noun masculine, meaning 'paddy'), brown rice with long grain; (2) *u-kyba-khyuriew hoi-lik*, a white rice with long grain; (3) *u-kyba la-tob*, round-grained rice; (4) *u-kyba khai*, bearded, husked; (5) *u-kyba-drw-ha-iong*, black husked rice (literally *u* = 'the,' *kyba* = 'paddy,' *drw* = 'earth,' *ha* = 'that,' *iong* = 'black'); (6) *u-kyba-ha-lik*, white rice; (7) *u-kyba-srim*, crested rice (literally *u* = 'the,' *kyba* = 'paddy,' *srim* = 'royal'); (8) *u-kyba la-krub*, large-grained rice; (9) *u-kyba-ha-tieng*, small-grained rice; (10) *u-kyba sa-kia*, early rice; (11) *u-kyba ra-ion*, late rice; (12) *u-kyba tang-la*, rice grown along with beans; (13) *u-kyba-ha-tik*, small rice.

Rice is cultivated in marshy fields situated near running water as well as in high lands. The first seven of the above thirteen species of rice are sown in marshy lands during the months of April and May,

16: McCormack E-4,5 (1956-1958) 1964
[P. 110B] AR7 Khasi AR7

another. In other words, a state is not a fixed territorial entity. In the early twentieth century, the most populous of the 25 chiefdoms, Khyrim, contained 36,833 persons occupying 7,859 houses in 372 villages, and the least populous, Nonglwai, contained 246 persons occupying 53 houses in 3 villages. Fifteen of the chiefdoms were headed by a *syiem* (chief), three by a *lyngdoh* (priest), six by a sirdar, and one by a *wahadadar*. These leaders all had executive and judicial functions, but a chief's authority was limited in that he had to obtain the approval of his executive council before acting. The other leaders were subject to a similar limitation. A chief maintained a small police force. His major sources of revenue were market tolls, fines, and, more recently, income from licenses to distill rice whisky. Succession to a ruling role in the larger states traditionally involved election by members of a lineage that had a hereditary right to elect, from among members of a lineage that had the hereditary right to rule. In British times, the elective basis was broadened, differentially in the various states, even to the point of popular elections. [Cf. Aitchison 1931; Lyngdoh 1952.] **Social stratification.** The three classes of lineage are the nobles, the commoners, and the slaves or servants. This stratification applies only to the recruitment to office in the native-state system, for there is no hypergamy, and in a village assembly everyone has equal voice. The noble lineages have the hereditary right to fill from among their male members roles such as village or state priest, councilor to a chief, or elector of a chief. The few lineages which today are remembered as slave or servant lineages had the inherited obligation to render special services to a chief's household. There is no Khasi term for "commoner." Every lineage other than a noble or a slave lineage is a commoner lineage, and the commoner lineages are in the majority. **Warfare.** Warfare was suppressed by the British, and little is known for certain about its traditional forms. The tactics which confronted the British were the ambush and the guerrilla raid. Traditional goals included taking heads from other Khasis and capturing women from the valleys.

000 175 619 62 (161) (793) (651) (666) (177) (178) 565 623 621 567 72 (177)

RELIGION. Major and indigenous religions. A Welsh Calvinistic Methodist missionary penetrated into Cherrapunji in 1832, and the work that he began continues to this day. His society, which has since become the Welsh Presbyterian Foreign Mission, introduced writing, village primary schools, a high school, a theological seminary, and a hospital. Competing missionaries followed, and by 1914 some Shillong Khasis were puzzling over the tenets not only of traditional Hinduism and Islam but also of the Buddhists, Brahmo Samaj, Arya Samaj, and Unitarians (Roy 1914). By the 1920s, missionaries of the Church of God and the Seventh Day Adventists were

797 17

It may perhaps be ascribed to the pre-eminence
accorded by the Khasis to the female sex that successive 162
censuses have shown that the women of this race
considerably exceed the men in number. According
to the census of 1901, there are 1,118 females to every
1,000 male Khasis. This excess, however, is surpassed
by that of the Lushais, 1,191 to 1,000, and it may
possibly be due to the greater risks to life encountered
by the men, who venture far into the plains as traders
and porters, while the women stay at home. Habits of 165
intemperance, which are confined to the male sex, may
also explain a greater mortality among them.

It would be interesting to investigate the effect 161
on reproduction of the system of matriarchy which 163
governs Khasi family life. The increase of the race is
very slow. In the census of 1891 there were enumerated
only 117 children under 5 to every hundred married
women between 15 and 40, and in 1901 this number fell
to 108. It has been suggested that the independence
of the wife, and the facilities which exist for divorce,
lead to restrictions upon child-bearing, and thus keep
the population stationary. The question might with
advantage be examined at the census of 1911.

The next characteristic of the Khasis which marks 787
them out for special notice is their method of divination 782
for ascertaining the causes of misfortune and the
remedies to be applied. All forms of animistic religion
make it their chief business to avert the wrath of the
gods, to which calamities of all kinds—sickness, storm,
murrain, loss of harvest—are ascribed, by some kind of
propitiation; and in this the Khasis are not singular.
But it is somewhat surprising to find among them the 787
identical method of *extispicium* which was in use among 171
the Romans, as well as an analogous development in
the shape of egg-breaking, fully described by Major
Gurdon (p. 221), which seems to have been known to

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

787 diviners in ancient Hellas.* This method has (with
171 much else in Khasi practice) been adopted by the
● former subjects of the Khasis, the Mikirs; but it does not appear to be prevalent among any other of the animistic tribes within the boundaries of India.

211 The third remarkable feature of Khasi usage is the
171 custom, which prevails to this day, of setting up great
731 memorials of rough stone, of the same style and character as the *menhirs* and *cromlechs* which are found in Western Europe, Northern Africa, and Western Asia. It is very surprising to a visitor, unprepared for the sight by previous information, to find himself on arrival at the plateau in the midst of great groups of standing and table stones exactly like those he may have seen in Brittany, the Channel Islands, the south of England, or the Western Isles. Unfortunately the great earthquake of June 1897 overthrew many of the finest of these megalithic monuments; but several still remain, and of these Major Gurdon has given an excellent description (pp. 144 sqq.), with an explanation of the different forms which they assume and the objects with which they are erected. Other races in India besides the Khasis set up stone memorials; but none, perhaps, to the same extent or with the same systematic purpose and arrangement.

114 In conclusion, I have only to commend this work to the consideration of all interested in the accurate and detailed description of primitive custom. I lived myself for many years among the Khasis, and endeavoured to find out what I could about them; but much of what Major Gurdon records is new to me, though the book generally agrees with what I was able

* Called φοιτικία: one of the lost books of the Orphic cycle was entitled τὰ φοιτικά.

impossible to state, as it is to fix upon the exact tract of country from which the Aryans sprang. With reference to the Khasi branch of the Mon-Anam family, it would seem reasonable to suppose that if they are not the autochthons of a portion of the hills on the southern bank of the Brahmaputra, and if they migrated to Assam from some other country, it is not unlikely that they followed the direction of the different irruptions of foreign peoples into Assam of which we have authentic data, i.e. from south-east to north-west, as was the case with the Ahom invaders of Assam who invaded Assam from their settlements in the Shan States *viâ* the Patkoi range, the different Burmese invasions, the movements of the Khamtis and, again, the Singphos, from the country to the east of the Hukong Valley. Whether the first cousins of the Khasis, the Mons, moved to their present abode from China, whether they are the aborigines of the portion of Burma they at present occupy, or were one of the races "of Turanian origin" who, as Forbes thinks, originally occupied the valley of the Ganges before the Aryan invasion, must be left to others more qualified than myself to determine. Further, it is difficult to clear up the mystery of the survival, in an isolated position, of people like the Ho-Mundas, whose language and certain customs exhibit points of similarity with those of the Khasis, in close proximity to the Dravidian tribes and at a great distance from the Khasis, there being no people who exhibit similar characteristics inhabiting countries situated in between; but we can, I think, reasonably suppose that the Khasis are an offshoot of the Mon people of Further India in the light of the historical fact I have quoted, i.e. that the movements of races into Assam have usually, although not invariably, taken place from the east, and not from the west. The tendency for outside people to move into Assam from the east still continues.

Affinities.

The late Mr. S. E. Peal, F.R.G.S., in an interesting and suggestive paper published in the Journal of the Asiatic Society of Bengal in 1896, drew attention to certain illustrations of

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

[114] 412 171 144

"singular shoulder-headed celts," found only in the Malay Peninsula till the year 1875, when they were also discovered in Chota Nagpur, and figured in the Journal of the Asiatic Society of Bengal for June of that year. These "celts" are, as the name implies, ancient stone implements. Mr. Peal goes on to state the interesting fact that when he was at Ledo and Tikak, Naga villages, east of Makum, on the south-east frontier of the Lakhimpur district of Assam, in 1895, he found iron implements, miniature hoes, used by the Nagas, of a similar shape to the "shoulder-headed celts" which had been found in the Malay Peninsula and Chota Nagpur. Now the peculiarly shaped Khasi hoe or *mo-khiw*, a sketch of which is given, with its far projecting shoulders, is merely an enlarged edition of the Naga hoe described by Peal, and may therefore be regarded as a modern representative in iron, although on an enlarged scale, of the "shoulder-headed celts." Another interesting point is that, according to Forbes, the Burmese name for these stone celts is *mo-gyo*. Now the Khasi name for the hoe is *mo-khiw*. The similarity between the two words seems very strong. Forbes says the name *mo-gyo* in Burmese means "cloud or sky chain," which he interprets "thunderbolt," the popular belief there, as in other countries, being that these palæolithic implements fell from heaven. Although the Khasi name *mo-khiw* has no connection whatsoever with aerolites, it is a singular coincidence that the name for the Khasi hoe of the present day should almost exactly correspond with the Burmese name for the palæolithic implement found in Burma and the Malay Peninsula, and when it is remembered that these stone celts are of a different shape from that of the stone implements which have been found in India (with the exception of Chota Nagpur), there would seem to be some grounds for believing that the

Khasis are connected with people who inhabited the Malay Peninsula and Chota Nagpur at the time of the Stone Age.* That these people were what Logan calls the Mon-Anam, may possibly be the case. Mr. Peal goes on to state, "the discovery is interesting for other reasons it possibly amounts to a demonstration that Logan (who it is believed was the first to draw attention to the points of resemblance between the languages of the Mon-Anam or Mon-Khmêr and those of the Mundas and the Khasis), was correct in assuming that at one time the Mon-Anam races and influence extended from the Vindyas all over the Ganges Basin, even over Assam, the northern border of the Ultra Indian Peninsula." Mr. Peal then remarks that the Eastern Nagas of the Tirap, Namstik, and Sonkap group "are strikingly like them (i.e. the Mon-Anam races), in many respects, the women being particularly robust, with pale colour and at times rosy cheeks." The interesting statement follows that the men wear the Khasi-Mikir sleeveless coat. Under the heading of dress this will be found described as a garment which leaves the neck and arms bare, with a fringe at the bottom and with a row of tassels across the chest, the coat being fastened by frogs in front. It is a garment of a distinctive character and cannot be mistaken; it used to be worn largely by the Khasis, and is still used extensively by the Syntengs and Lynngams and by the Mikirs, and that it should have been found amongst these Eastern Nagas is certainly remarkable. It is to be regretted that the investigations of the Ethnographical Survey, as at present conducted, have not extended to these Eastern Nagas, who inhabit tracts either outside British territory or in very remote places on its confines, so that we are at present unable to state whether any of these tribes possess other points of affinity, as

* It is interesting to compare the remarks of M. Aymonier in his volume iii. of "Le Cambodge." He writes as follows:—"Mais en Indo-Chine on trouve, partout disseminé, ce que les indigènes, au Cambodge du moins, appellent, comme les peuples le plus éloignés du globe 'les traits de foudre.' Ce sont ici des haches de l'âge néolithique ou de la pierre polie, dont la plupart appartiennent au type répandu en toute la terre. D'autres de ces celtes, dits épaulés, parceque ils possèdent un talon d'une forme particulière, paraissent appartenir en propre à l'Indo-Chine et à la presqu'île dekkhanique. Ils fournissent donc un premier indice, non négligeable, d'une communauté d'origine des populations primitives des deux péninsules, cis et transgangétiques."

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

144 regards social customs, with the Khasis; but it will be noticed
211 in the chapter dealing with memorial stones that some of the
171 Naga tribes are in the habit of erecting monoliths somewhat similar in character to those of the Khasis, and that the Mikirs (who wear the Khasi sleeveless coat), erect memorial stones exactly similar to those of the Khasis. The evidence seems to suggest a theory that the Mon-Anam race, including of course the Khasis, occupied at one time a much larger area in the mountainous country to the south of the Brahmaputra in Assam than it does at present. Further references will be found to this
144 point in the section dealing with memorial stones. The fact
171 that the Ho-Mundas of Chota Nagpur also erect memorial stones and that they possess death customs very similar to those of the Khasis, has also been noticed in the same chapter. We have, therefore, the following points of similarity as regards customs between the Khasis on the one hand, certain Eastern Naga tribes, the Mikirs, and the ancient inhabitants of the Malay Peninsula on the other :—

(a) Peculiarly shaped hoe, i.e. the hoe with far projecting shoulders	1. Khasis. 2. Certain Eastern Naga tribes. 3. The ancient inhabitants of the Malay Peninsula. 4. The ancient inhabitants of Chota Nagpur (the Ho-Mundas ?).
(b) Sleeveless coat	1. Khasis. 2. Mikirs. 3. Certain Eastern Naga tribes.
(c) Memorial stones	1. Khasis. 2. Mikirs. 3. Certain Eastern Naga tribes. 4. Ho-Mundas of Chota Nagpur.

197 I wish to draw no definite conclusions from the above facts,
144 but they are certainly worth considering with reference to Logan's theory as stated by Peal: the theory being based on Logan's philological inquiries. Thanks to the labours of Grierson, Logan, and Kuhn in the linguistic field, we know that the languages of the Mon-Khmêr group in Burma and the Malay Peninsula are intimately connected with Khasi. I say, intimately, advisedly, for not only are roots of words seen to be similar, but the order of the words in the sentence is found to be the same, indicating that both these people think in the same order when wishing to express themselves by speech.

There are also syntactical agreements. We may take it as finally proved by Dr. Grierson and Professor Kuhn that the Mon-Khmér, Palaung, Wa, and Khasi languages are closely connected. In the section of the Monograph which deals with language some striking similarities between the languages of these tribes will be pointed out. We have not so far been able to discover social customs common to the Palaungs and the Khasis; this is probably due to the conversion of the Palaungs to Buddhism, the change in the religion of the people having possibly caused the abandonment of the primitive customs of the tribe. In a few years' time, if the progressive rate of conversions of Khasis to Christianity continues, probably the greater number of the Khasi social customs will have disappeared and others will have taken their place, so that it cannot be argued that because no manifest social customs can now be found common to the Khasis and the Palaungs, there is no connection between these two tribes. The strong linguistic affinity between these two peoples and the wild *Was* of Burma points to an intimate connection between all three in the past. As knowledge of the habits of the wild *Was* improves, it is quite possible that social customs of this tribe may be found to be held in common with the Khasis. With regard to social affinities it will be interesting to note the Palaung folk-tale of the origin of their Sawbwa, which is reproduced in Sir George Scott's Upper Burma Gazetteer. The Sawbwa, it is related, is descended from the Naga Princess Thusandi who lived in the *Nat* tank on the Mongok hills and who laid three eggs, from one of which was born the ancestor of the Palaung Sawbwa. Here we see how the Palaung regards the egg, and it is noteworthy that the Khasis lay great stress on its potency in divination for the purposes of religious sacrifices, and that at death it is placed on the stomach of the deceased and is after-wards broken at the funeral pyre. Amongst some of the tribes of the Malay Archipelago also the *Gaji-Guru* or medicine-man "can see from the yolk of an egg, broken whilst sacramentally counting from one to seven, from what illness a man is suffering and what has caused it." Here we have an almost exactly parallel case to the Khasi custom of egg-breaking.

In the Palaung folk-tale above referred to the importance of

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

the egg in the eyes of Palaung is demonstrated, and we know how the Khasi regards it. But the folk-tale is also important as suggesting that the ancient people of Pagan were originally serpent-worshippers, i.e. *Nágas*, and it is interesting to note that the Ronai or Palaung women of the present day "wear a dress which is like the skin of the Naga (snake)." Is it possible that the Khasi superstition of the *thlen*, or serpent demon, and its worship, an account of which will be found under the heading of "Human Sacrifices" in the Monograph, has anything to do with the ancient snake-worship of the people of Pagan, and also of the ancient inhabitants of Naga-Dwipa, and that amongst the wild *Was* the custom of head-hunting may have taken the place of the Khasi human sacrifices to the *thlen?*

Notwithstanding that Sir George Scott says the story has very Burman characteristics, the Palaung folk-tale is further interesting in that it speaks of the Sawbwa of the Palaungs being descended from a *princess*. This might be a suggestion of the matriarchate.

It can well be imagined how important a matter it is also, in the light of Grierson's and Kuhn's linguistic conclusions, to ascertain whether any of the Mon-Khmér people in Annam and Cambodia and neighbouring countries possess social customs in common with the Khasis. In case it may be possible for French and Siamese ethnologists in Further India to follow up these inquiries at some subsequent date, it may be stated that information regarding social customs is required with reference to the people who speak the following languages in Annam and Cambodia and Cochin China which belong to the Mon-Khmér group—*Sok*, *Stieng*, *Bolaor*, *Aromre*, *Khamen-Bawa*, *Xong*, *Annam*, *Khoa*, and *Lamet*.

Notwithstanding our failure up till now to find any patent and direct social customs in common between the Khasis and the Palaungs, I am in hope that we may yet discover some such affinities. Mr. Lewis, the Superintendent of Ethnography in Burma, states that there is no vestige of the matriarchal system among the Palaungs; but there is the folk-tale I have quoted above. In matters of succession, inheritance, &c., the Palaungs, Mr. Lewis, says, profess to follow the Shans, whose customs in this regard have a Buddhistic basis. The Palaungs

are devout Buddhists, and, like the Burmans and Shans, bury their lay dead, whereas the Khasis invariably burn. There is nothing in the shape of memorial stones amongst the Palaungs. *Primâ facie* these appear to be points of differentiation between the Palaungs and the Khasis; but they should not, as has already been stated, be regarded as proof positive that the tribes are not connected, and it is possible that under the influence of Buddhism the Palaungs may have almost entirely abandoned their ancient customs, like the Christian Khasis.

Having noticed some similarities as regards birth customs, as described in Dr. Frazer's "Golden Bough," between the Khasis and certain inhabitants of the Dutch East Indies, I wrote to the Dutch authorities in Batavia requesting certain further information. My application was treated with the greatest courtesy, and I am indebted to the kindness of the President, his secretary, and Mr. C. M. Pleyte, Lecturer of Indonesian Ethnology at the Gymnasium of William III., at Batavia, for some interesting as well as valuable information. With reference to possible Malay influence in the countries inhabited by the people who speak the Mon-Khmér group of languages in Further India, it was thought desirable to ascertain whether any of the people inhabiting the Dutch East Indies possessed anything in common with the Khasis, who also belong to the Mon-Khmér group. There are, according to Mr. Pleyte, pure matriarchal customs to be found amongst the Minangkabe Malays inhabiting the Padang uplands and adjacent countries, in Sumatra, in Agam, the fifty Kotas, and Tanah Datar, more or less mixed with patriarchal institutions; they are equally followed by the tribes inhabiting parts of Korinchi and other places. The apparently strong survival of the matriarchate in parts of the island of Sumatra, as compared with this corresponding most characteristic feature of the Khasis, is a point for consideration. Mr. Pleyte goes on to state "regarding ancestor-worship, it may be said that this is found everywhere throughout the whole Archipelago; even the tribes that have already adopted Islam, venerate the spirits of their departed." The same might be said of some of the Khasis who have accepted Christianity, and much more of the Japanese. I would here refer the reader to the chapter on "Ancestor-worship." In the

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Southern Moluccas the placenta is mixed with ashes, placed in a pot, and hung on a tree; a similar custom is observed in Mandeling, on the west coast of Sumatra. This is a custom universally observed amongst the Khasis at births. Teknonomy to some extent prevails amongst some of these Malay tribes as with the Khasis. It will be seen from the above notes that there are some interesting points of affinity between the Khasis and some of the Malay tribes, and if we add that the Khasis are decidedly Malay in appearance, we cannot but wonder whether the Malays have any connection not only with the Mon-Khmèr family, but also with the Khasis, with the Ho-Mundas, and with the Naga tribes mentioned by Mr. Peal in his interesting paper published in the Journal of the Asiatic Society of Bengal, already referred to. We will study the strong linguistic affinities between these peoples in the section which deals with language.

M. Aymonier in "Le Cambodge" mentions the matriarchate as having been prevalent apparently amongst the primitive races of Cambodia, and notes that the ancient Chinese writers spoke of Queens in Fou-nan (Cambodia). If the Khmèrs were the ancient people of Cambodia, here we have an important landmark in common between them and the Khasis. M. Aymonier goes on to speak of priestesses, and the Cambodian taboo, *tam or lenam*, which Mr. Lowis, the Superintendent of Ethnography in Burma, suggests may be akin to the Khasi *sang*.

DRESS.

Dress may be divided into two divisions, ancient and modern. It will be convenient to take the former division first. The Khasi males of the interior wear the sleeveless coat or *jymphong*, which is a garment leaving the neck and arms bare, with a fringe at the bottom, and with a row of tassels across the chest; it is fastened by frogs in front. This coat, however, may be said to be going out of fashion in the Khasi Hills, its place being taken by coats of European pattern in the more civilized centres and by all sorts of nondescript garments in the interior. The sleeveless coat, however, is still worn by many

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

sary, as in times of trouble. These offerings take the shape of articles of food which are theoretically partaken of by the shades of the deceased ancestors, the idea of making such offerings being very similar to that of the Hindus when they offer the "*pinda*," or cake, to nine generations of ancestors, i.e. to propitiate the shades of the departed, and to obtain their help thereby. U Herson Bai Dongdoh writes that, "the soul religious demand" amongst the Khasis is the *ai hum*, or giving of food to the spirits of deceased ancestors, in order that the latter may aid the living members of the clan with their help, and bless them. To honour dead ancestors is the duty of every Khasi, and he who wilfully neglects this duty, it is believed, will neither receive their help, nor be defended from the influence of the numerous spirits of evil in which the Khasis believe. Amongst the Syntengs, a few days after depositing the bones in the ancestral tomb, the ceremony of feeding the spirits of the dead is performed. At this ceremony there are some families which give two pigs for each person of the family who is dead, and there are some who give one. The pigs are taken to the *diep-ang*, or puja house of the clan. Presumably, pigs are usually offered to the shades only of those members of the family whose remains have been recently deposited in the clan cromlech. In the chapter dealing with memorial stones the reader will notice how many of them are erected to the memory of deceased ancestors, and how they bear the names of such ancestors, e.g. *Ka Bowbai* (the first grandmother), *U Bowbain*, or *U bai ranghah* (the first maternal uncle). It was the custom in former days to make offerings of food upon the flat table-stones to the spirits of the deceased ancestors, and this is still the custom in places in the interior of the district. This practice, however, may be said to be largely dying out, it being now commonly the custom to make the offerings in the house, either monthly, or at times when it is thought necessary to invoke the aid of the departed. Such acts of devotion may well be said to partake of the nature of worship. As has been the case in other countries, and amongst other people, it is possible that the Khasi gods of to-day are merely the spirits of glorified deceased ancestors transfigured, as has happened with some of the gods of the

In Garden E-6, 5 (no date) 1907 ART Khasi ART

Shinto Pantheon of Japan. It may be interesting to note that the ancient Shinto cult of Japan possesses some features in common with the ancestor-worship of the Khasis. Take the funeral ceremonies. With both people we find the dead laid out in the house, food placed before the corpse, and the funeral ceremonies taking place, accompanied by music and dancing. Mr Lafcadio Hearn, in an interesting book on Japan, writes "that in ancient times the Japanese performed ceremonies at regular intervals at the tombs of deceased members of the family, and food and drink were then served to the spirits;" this is exactly what the Khasis used to do at their cenotaphs. This, apparently, was the practice in Japan before the "spirit tablet" had been introduced from China, when the worship of the ancestors was transferred from the tomb to the house. We have an exactly similar instance of evolution amongst the Khasis of the present day, i.e. the transfer of the ancestor cult from the flat table-stones erected in honour of deceased ancestors to the house. Last, but not least, is the idea common to both people, that no family or clan can prosper which does not duly perform the worship of deceased ancestors; this, as Hearn puts it, is "the fundamental idea underlying every persistent ancestor-worship, i.e. that the welfare of the living depends upon the welfare of the dead." The "Khasi Mystic," in an interesting article, notes some further points of resemblance between the methods of ancestor-worship adopted by the two people. The following instances may be quoted. Amongst the Japanese the spirits of those who fall in battle are said to help their fellow-countrymen who are still fighting. The "Khasi Mystic" quotes a similar belief as having existed amongst the Khasis in former days. The remains of Japanese warriors who die in battle are said to be reverently taken to the warrior's home at the first opportunity. The Khasis do likewise, the sinking in defeat of the allies of Khasi transport coolies, who were employed on military expeditions on the North-Eastern Frontier, having been carried home by the survivors to present to the dead man's relations, who then performed the ceremonies prescribed by custom for those who have died violent or untimely deaths. Of all deceased ancestors the Khasis revere *Ki Jaidei* the most, the word *Jaydei* being made up of

1:Gordon E-4, 5 (no date) 1907 A27 Khasi A27

"sow, short for Mme (grandmother), and Ka, mother. *Ka Iawbei* is the primeval ancestress of the clan. She is to the Khasis what the "tribal mother" was to old Celtic and Teutonic genealogists, and we have an interesting parallel to the reverence of the Khasis for *Ka Iawbei* in the Celtic goddess Brigit, the tribal mother of the Brigantes. Later on, like Ka Iawbei, she was canonized, and became St. Bridget.*

The greater number of the flat table-stones we see in front of the standing monoliths in these hills are erected in honour of *Ka Iawbei*. In former times, it was the custom to offer food to her on these stones. In cases of family quarrels, or dissensions amongst the members of the same clan, which it is desired to bring to a peaceful settlement, it is customary to perform a sacrifice to the first mother, "*Ka Iawbei*." They first of all take an augury by breaking eggs, and if it appears from the broken egg-shells that *Ka Iawbei* is offended, they offer to her a cotton cloth, and sacrifice a hen. On these occasions invocations are uttered, and a small drum, called, "*Ka 'sing ding dong*," is beaten. It is not unlikely that the Khasi household deities, *Ka lei ding* and *Ka lawa la jingpon*, to whom pujas are offered for the welfare of the house, are also *Ka Iawbei* in disguise. Notwithstanding the strong influence of the matriarchate, we find that U Thawlang, the first father and the husband of *Ka Iawbei*, is also revered. To him on occasion of domestic trouble a cock is sacrificed, and a *jymphong*, or sleeveless coat is offered. This puja is called *baba tap Thawlang*, i.e. covering the grandfather. The following invocation to U Thawlang is then chanted:—"Oh, father Thawlang, who hast enabled me to be born, who [illegible] and my life, I have secured thee, oh, father, be not offended, for I have given thee a pledge and a sign, i.e. a red and white sleeveless coat. Do not deliver me into the power of (the goddess of) illness, I have offered thee the propitiatory—ok that thou mayest carry me in thine arms, and that I may be aware of thee, my father Thawlang."

We see clearly from the above prayer that the Khasi idea is that the spirit of the deceased male ancestor is capable of

* Kuno Francke's essay on "medieval age civilization."

In Gaston K-4, 5 (no date) 1907 ART Khasi ART

being in a position to help his descendant in times of trouble. The same thought underlies the extreme reverence with which *Ka Iawbei* is regarded. Thus we see a striking point of resemblance between the Khasi ancestor-worship and the ancient Shinto cult of Japan, as described by Mr. Lafcadio Hearn. *U Doid-Sin*, or *u Kni Blogbah*, the first maternal uncle, i.e. the elder brother of *Ka Iawbei*, is also much revered. It will also be noticed under the heading of memorial stones that the great central upright monolith of the *mawbynna*, or memorial stones, is erected in his honour. The influence of the *kni*, or mother's elder brother, in the Khasi family is very great, for it is he who is the manager on behalf of the mother, his position in the Khasi family being very similar to that of the karta in the Hindu joint family. It is on this account that he is so much revered, and is honoured with a stone which is larger than the other up-right memorial stones after death. It will be seen in the article dealing with "the disposal of the dead," that at Cherra, on the occasion of the burial of the ashes in the cremation of the *ainl*, a part of the attendant ceremonies consists of the preparation of two effigies called *Ka Pawa* and *U Tyngkop*, intended to represent *Ka Iawbei* (the first mother) and *U Doid-Sin* (the first maternal uncle). The Wars of Nongpi have a custom peculiar to themselves. They erect small thatched houses in their compounds, which they call *ing lawid*. When they worship their ancestors they deposit offerings of food in these houses, the idea being that the ancestors will feed on the offerings. These Wars do not erect memorial stones, nor do they collect the ashes of the *ainl* in a common sepulchre; they deposit the ashes in circular concavities, each family, or *ing*, possessing one. It should further be noted with reference to the Khasi custom of *ai bam*, or giving food to the spirits of deceased ancestors, that Dr. Frazer, in his "Golden Bough," has mentioned instances of foodstuffs being offered to the spirits of deceased ancestors by the tribes inhabiting the Malay Archipelago. (See pages 462-463 of the "Golden Bough.") Some other points of similarity in customs have already been noticed between the Khasis and certain Malay tribes.

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

should be severed with one blow. As soon as the head was cut off there was a rush on the part of the sacrifiers to see in which direction the head faced. If the head faced towards the north or west, it was considered an evil omen; if it faced towards the south or east, a good omen. The east is a lucky quarter amongst the Assamese also. The people ended up the proceedings by giving a long-drawn-out, deep-toned chant, or *hynkai*. Immediately after the ceremony was concluded hundreds of boats shot out from the numerous creeks, where they had been lying, and fished the river all night, the result being an immense haul, to the delight of the Lyngngams, who were seen next morning roasting the fish whole on bamboo stakes, after which they consumed them, the entrails being eaten with great gusto. Such is the worship of the goddess of the Pomsiñ.

Similar pujas take place among the people of Wie-ding (the valley of fire) before they fish in the Khai-mara river and elsewhere in the Khasi Hills. In the Jaintia Hills there is the Myntong-worship of the Kopili river, which used to be accompanied by human sacrifices, as has been mentioned above, pp. 102-104. The Myntong river, a tributary of the Kopili, must also be annually appeased by the sacrifice of a he-goat. Numerous hills also are worshipped, or rather the spirits which are said to inhabit them. One of the best known hill goddesses is the deity who is thought to inhabit the little wood close to the summit of the Shillong Peak. This deity is said to have been discovered by a man named "U Shillong," who gave his name to the Shillong Peak, and indirectly to our beautiful hill station. The Siems of Mylliem and Nongkrem reverence U'lei Shillong, and there are certain clans who perform periodical sacrifices to this god. Probably the origin of the superstitious reverence with which U'lei Shillong is held by the Siems of Nongkrem and Mylliem is that their fabled ancestor—the Pah ryngam, of whom an account will be found in the folk-lore section, took his origin from a rock not far from the Shillong Peak in the Nongkrem direction.

Rubiong Hill, which is within full view of the Shillong Peak to an easterly direction, is also said to be the abode of a minor god who is periodically propitiated by the members of the Mawthoh clan of the Khyrim State with a he-goat and a cock.

restored by the due propitiation of the offended spirits. In order to ascertain which is the offended spirit, a system of divination by means of cowries, breaking eggs, or examining the entrails of animals and birds, was instituted. The Khasi method of obtaining auguries by examining the viscera of animals and birds may be compared with that of the Roman haruspex. Some description of these modes of divination has been given at the end of this chapter. The Khasi religion has been described by Rivett as "demon worship, or a jumble of enchantments muttered by priests who are sorcerers." But even a religion which is thus unflatteringly described is based on the cardinal doctrines of sin and sacrifice for sin. Tradition amongst the Khasis states that in the beginning (*nyngrophong ka ongi*) there was no sin, heaven and earth were near each other, and man had direct intercourse with God. How man fell into sin is not stated, but it is certain that he did fall. Experts at "egg healing" never forget to repeat the formula "*nga briew nga la pap*" (I man have sinned). The cock then appears as a mediator between God and man. The cock is styled "*u khlaw ka blei u khlaw ka blei u khlaw syndong ka shah syndong ka ka kynta jong nga u briew*," i.e. the son of god who laye down his neck (life) for our man. The use of the feminine *ka blei* is no doubt due to matriarchal influence. There is another prayer in which the Khasis say, "*ay jatong ma u blei iong ranghah ma u briew*" (oh god do not forget the covenant, arise oh man). The idea is that man has fallen into sin of omission and commission (*ka pap, ka lait ka lei*) but that God is nevertheless expected to spare him, and to accept a substitute for him according to the covenant (*jatong*). By this covenant God is supposed to have accepted in exchange the cock as a sin-offering for man. "How the cock came to occupy such an important position, tradition is vague and self-contradicting. The fact remains that the covenant of the cock is the foundation of the Khasi religion. It is of interest to mention that amongst the Aboms the tradition is that Khunlung and Khunlai brought down from heaven the *lei-shim-mang*,* a pair of heavenly fowls, and that to this day the sacrifice of the

* In Abom *lei* is fowl, *shim* is beautiful, *mang* is country. Therefore *Kingshim-mang* is fowl of a beautiful country (heaven).

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

77/ 925 fowl is considered by the Deodhais, or priest-soothsayers of the Abors, a most important feature of the ancient Abor ritual. ([71]) But amongst the Abors there is the difference that augaries are obtained, not from the entrails, but by examining the legs of the fowls. The Abors are Shans belonging to the Tai branch, another great division of the Indo-Chinese group of the human race.

787 925 The covenant of the cock as thus explained shows the importance of this sacrifice to the Khasis. The large intestine of a fowl has two pea-like protuberances, one close to the other. One is symbolically called *u Iaei* or god, and the other is styled *u Iaiim* or man, they are connected by a thin membrane. Directly the bird has been disembowelled the sacrificer throws a few grains of rice on the entrails and then watches their curvilinear movements. If the portion of the entrail called *u Iaei* moves towards that portion which represents man, it is considered good positive that the god has heard the prayer of the sacrificer, but if the movement proceeds in the opposite direction, then the reverse is the case and the omen is bad. If the entrails are full and healthy, having no spots (*lum*), or blood marks (*thang*), and if the membrane between the two protuberances has not been fractured, these are favourable signs. If the intestines are empty, wrinkled, or spotted, and the membrane mentioned above is fractured, these are bad signs. Augaries also are drawn by examining the livers, the lungs and spleens and gall bladders of pigs, goats, and cattle. If the liver of a pig is healthy and without spot, the augury is good; if the reverse, it is bad. The spleen must not be unduly lacerated, otherwise the omen is unfavourable and the gall bladder must not be over full. Invocations to deduce omens from the appearance of the entrails are quoted on page 11 of Col. Dixon's Report. From the first invocation quoted by him it appears that the method of drawing the augury from the fowl differs slightly in detail from that which has been described to me by certain Khasis, but both descriptions agree in the main, and the slight dissimilarity in detail may be due to the methods of obtaining augaries varying slightly in different localities. Divination by breaking eggs and by other means, although not strictly sacrifice with the Khasis, partakes

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

553 when they do this they invariably fall crossed to the ground. "They thus save their eggs, save time and trouble, get the
553 name they desire for the child. . . ." It is noteworthy that
844 the Khasis consider it necessary to preserve the placenta until the ceremony of naming the child is over, and that the pot containing the placenta is waved over the head of the child before it is removed and hung up in a tree.

844 Dr. Frazer, at page 53 *et seq.* of the "Golden Bough," when
171 dealing with the subject of sympathetic magic, refers to the navel string and the placenta as parts which are commonly believed amongst certain people to remain in sympathetic union with the body after the physical connection has been severed, and it is interesting to note that in the Bahar Archipelago, between New Guinea and Celebes, the placenta is mixed with ashes and put in a small basket, which seven women, each of them armed with a sword, hang up on a tree of a peculiar kind (*ficus bodrica*). The women carry the swords for the purpose of frightening the evil spirits, otherwise the latter might get hold of the placenta and make the child sick. Mr. C. M. Pleyte, Lecturer on Indonesian Ethnology, at the Gymnasium Willem III. at Batavia, who has most courteously furnished me with some interesting information on this subject, states that it is especially in the Southern Moluccas that the placenta is mixed with ashes and hung in a tree. Wider spread is the custom of placing the after-birth on a small bamboo raft in a stream "in order that it may be caught by crocodiles, incarnations of the ancestors, who will guard it till the person to whom it has belonged dies. Then the soul of the placenta is once more united with that of the dead man, and together they go to the [illegible] heads, 'proving thereby the connection between man and their placentas is never withdrawn.' The Khasis, although they cannot explain the meaning of the presence of the placenta at the naming ceremony, and the care with which they remove it and hang it up in a tree, are probably really actuated by the same sentiments as the inhabitants of the Southern Moluccas, i.e. they believe that there is, as Dr. Frazer puts it, a sympathetic union with the body after the physical
546 connection with the child has been severed. There is no fixed
784 period of seven or eleven, after a birth, but the parents of the

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

close to the wall which is farthest away from the door, the bones of the males being deposited in a pot inside the tomb nearest the door. Some clans keep the pot containing the bones of the males on the right, and the vessel containing those of the females on the left hand. Then offerings of food and libations of liquor are offered to the ancestors on a stone in front of the tomb. The males then perform a ceremonial dance with swords and shields, three times, and the door of the sepulchre is closed, a flag being fixed to the tomb. All the clansfolk then depart except three men. One of these sacrifices a cock (*ior-tandiog*) in front of the tomb, a second sits behind the sacrificer, holding three firebrands, and a third sits behind the tomb. The man with the firebrands shakes them about, and then crows like a cock three times. The man behind the tomb listens attentively for any fancied noise within it, the superstition being that if the ceremonies detailed above have not been properly performed, the whole tomb will quake. If the three watchers are satisfied that there is no commotion within the tomb, then all is well, and they return and report the result to the clanspeople. This ceremony is called *tandiog*, or the fire test. Next morning the woman who is the head of the *ling-soop*, or puja-house, distributes to all those who have taken part in these sacrifices the hinder portions of the sacrificial animals. She then blesses one by one the assembled clansfolk. The latter are not permitted by custom to go to work until after three days from the time of the ceremony; the third day being called *ka ongi lait ia*. The ceremony described above is a symbolical one. The massive stone sepulchre is regarded as a symbol of a secure place of rest for the departed spirits. If the spirits of the dead are not, however, appeased by the due performance of the ceremonies attending the interment of the remains in the clan sepulchre, it is believed that they roam about and haunt their relatives on earth, and plague them with various misfortunes. It may be interesting to note here, that Mr. Mobeely, the Superintendent of Ethnography in Bengal, reports that the ashes of deceased Hos, after being sprinkled with water by means of peepul branches, are collected, dried, and placed in a new earthen pot, and kept in the house until the day of burial, which may take place, as with

764

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

the Khasis long afterwards. The bones are buried in the village under a large slab of stone (cf. the Khasi stone *cisternæ*), and a monolith is erected outside the village to commemorate the deceased.

KHASI MEMORIAL STONES.

Probably one of the first objects which strikes the eye of a visitor to the Khasi Hills is the very large number of monoliths, table-stones, and cromlechs that are to be met with almost everywhere in that country. Yule, Dalton, and other writers have incidentally referred to them, but, as far as is known at present, no attempt has been made to explain in any detail what is the peculiar significance of these objects to the Khasis. These stones are rightly styled memorial stones; *kynmaw*, literally "to mark with a stone," is the word in the Khasi language for "to remember." The memorial stone, in the ordinary sense of the word, is a memorial to the dead; but we have such names of places in these hills as *Mawshuk*, the salt stone (the eating of salt off the blade of a sword being one of the Khasi forms of oath), *Mawsmai*, the oath stone, *Maophlang*, the grassy stone, and others. To commemorate with a stone an important event has been a constant custom amongst many people in many places, and the erection of grave-stones, to mark the spot where the remains of the dead are buried, is an almost universal practice amongst the Western nations, as indeed amongst some of the Eastern also. But the Khasi monoliths are no more grave-stones, in the sense of marking the place where the remains of the dead lie, than some of the memorials of Westminster Abbey and other fanes; the Khasi stones are cenotaphs, the remains of the dead being carefully preserved in stone sepulchres, which are often some distance apart from the memorial stones. It is proposed to treat this subject under the following heading:—

(1) A general description of the memorial stones in the Khasi Hills, showing that they are very similar in shape to monoliths, table-stones, or cromlechs in other parts of the world and of India.

(2) A comparison between Khasi memorial stones and those of the Ho-Mundas, the stones near Belgaum, those of

1: Gurion E-4, 5 (no date) 1907 AR7 Khasi AR7

211 U Lah Lasker and U Mar Phalyngki, to commemorate the
115 establishment of Nartiang market, which is called Iew Mawlong. "Lasko" is the Synteng equivalent of the Khasi *lyngskor*, or prime minister. "Mar" is a Synteng word meaning a giant, the idea amongst the people being that in the olden days there were giants in the land who performed marvellous feats of strength, e.g. the erection of the megalithic remains at Nartiang and elsewhere. A puja is performed upon a great flat stone by the *doli* and his officers in honour of the founders of the market but no animals are sacrificed, rice and *ryoi* (balls of rice) only being offered. In the days of the Jaintia kings only the Raj could sit upon the great flat stone; hence the name *maw jog Siem* (or Siem's stone). The great upright stone is said to have been brought by U Lah Lasker and a great number
211 of people from Suriang, a place near Nartiang. With reference
72 to the Nartiang stones I would refer to my theory, formu-
111 lated above, that they were originally connected with human sacrifice. It may be mentioned that at Nartiang there is a bridge constructed out of a single stone, which is also said to have been set in position by U Lah Lasker. Near Suhtngatbere is a group of stones, said to have been originally thirty in number, together with *maw shongthait*, or stones to seat thereon, which were erected to the memory of a woman, Ka Kamatwat, who in generations past is alleged to have had no less than *thirty* husbands. The lady is not supposed to have been polyandrous, nor nine-lived, but to have divorced one husband after another. As she probably established a record
211 for divorce, her descendants afterwards commemorated her in
[131] the manner described. There is another, very large, stone at Nongkseu, which unfortunately fell to the ground in the great earthquake shock of 1897. This stone must have stood over 20 ft. above the ground. It is called a *mawkoi Siem*, the stone of the Siem's maternal uncle, and it used to form the central stone, or *mawkoi*, of a line of stones. These stones belong to the clan of the *besses* of Nongkseu, which furnishes the *sohbiei*, or head sacrificer, of the Siems of Khyrim. The stones at Mawmaei, which in ancient days used to be the head-
211 quarters of a Siem, are some of the best carved in the hills.
171 At Mawrongjong, in the Jaintia sub-division, is a stone upon

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

211 which a figure, evidently of a Hindu god, has been carved, without
•171 doubt after the erection of the stone. Here we have a striking parallel case to the painted and carved menhir near Tregastel in Brittany, upon which has been carved the representation of a crucifix. There are also some carved stones near Nartiang (said to represent two women) called *mouthawdur briew*.

211 The Khasis say that these great stones were brought
483 sometimes from considerable distances. After being hewn, the stones were laid on a large, wooden trolley and dragged
283 across country by means of ropes of cane, of which plenty can be had from the Wár country on the southern side of the district, and then placed in position by means of ropes and levers. It seems little short of marvellous that these stones, which sometimes weighed many tons, were placed in position by such primitive means, especially when we consider the great trouble there was to re-erect one of the fallen stones at Stonehenge lately. Nowadays only comparatively small stones are erected, which are generally hewn and erected on the spot, so that there is no necessity for any conveyance.

000 In conclusion, it may be remarked that the subject of the Khasi monoliths is in reality a large one, on which a great deal could be written, but owing to considerations of space it has been found necessary to compress the account within its present limits.

FESTIVITIES, DOMESTIC AND TRIBAL.

555 Dancing forms the principal part of all the Khasi festivities,
776 and is an important adjunct of some of their religious ceremonies. One of the greatest festivals in the Khasi Hills is
776 the Nongkrem dance; it may be said to be as important
789 an event to the Khasis as the *Bah diengkhlam* festivities are to
782 the Syntengs.

The Nongkrem dance is really part of what is known as the *pomblang* or goat-killing ceremony, performed by the Siem of Khyrim (or Nongkrem) with the aid of his *sok-lói* (high priest) and the various *lyngdohs* (or priests) to Ka Blei Synthar (the ruling goddess), that the crops may prosper and that there may

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

custom of their own from cultivating the *lendon*, in which case they plant certain other trees favourable to the growth of the lac insect. The villages are situated near their patches of cultivation in the forest. The villages are constantly shifting, owing to the necessity of burning fresh tracts of forest every two years. The houses are entirely built of bamboo, and, for such temporary structures, are very well built. In front, the houses are raised some 3 or 4 ft. from the ground on platforms, being generally built on the side of a fairly steep hill, one end of the house resting on the ground, and the other on bamboo posts. The back end of the house is sometimes some 8 or 9 ft. from the ground. At the end of the house farthest away from the village path is a platform used for sitting out in the evening, and for spreading chillies and other articles to dry. Some Lyngngam houses have only one room in which men, women, and children are all huddled together, the hearth being in the centre, and, underneath the platform, the pigs. Well-to-do people, however, possess a retiring room, where husband and wife sleep. A house I measured at Nongpdiar village was of the following dimensions:—Length, 42 ft.; breadth, 16 ft.; height of house from the ground to the eaves, front, 9 ft.; back 18 ft. Houses are built with a portion of the thatch hanging over the eaves in front. No explanation could be given me for this. It is probably a Garo custom. In some Lyngngam villages there are houses in the centre of the village where the young unmarried men sleep, where male guests are accommodated, and where the village festivities go on. These are similar to the *dekhelang* or bachelors' club-houses of the Mikirs, Garos, and Labangs, and to the *morung* of the Nagas. This is a custom of the Thibet-Burman tribes in Assam, and is not a Khasi institution. There are also high platforms, some 12 ft. or 15 ft. in height, in Lyngngam villages, where the elders sit of an evening in the hot weather and take the air. Lyngngam houses and villages are usually much cleaner than the ordinary Khasi villages, and although the Lyngngam keep pigs, they do not seem to be as much *en évidence* as in the Khasi village. There is little or no furniture in a Lyngngam house. The Lyngngam sleeps on a mat on the floor, and in cold weather covers himself with a

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

773 obeyed, the country became free of the *Thlen*: but one small piece re-
mained which no one would eat, and from this sprang a multitude o
Thlens, which infest the residents of Cherra and its neighbourhoo
When a *Thlen* takes up its abode in a family there is no means o
getting rid of it, though it occasionally leaves of its own accord, an
often follows property of the family when given away or sold. Th
Thlen attaches itself to wealth, and brings prosperity and wealth to th
family, but on the condition that it is supplied with *blood*. Its cravin
comes on at uncertain intervals: and manifests itself by sicknes
among the family, by misadventure, or increasing poverty. It can onl
be appeased by the murder of a human being. The murderer takes th
hair, the tips of the fingers, and a little blood from the nostril, caugh
in a bamboo tube, and offers these to the *Thlen*. The belief is that th
demon then appears in the form of a snake and devours the body of th
murdered person, which is materialised from the portions thus offere
After this, its craving is satisfied for a time, and the affairs of the
house prosper. Many families in these hills are known or suspected t
be *Ki-thlen*, or keepers of a *Thlen*, and are dreaded and avoided in co
sequence. Whenever a dead body is found with the marks above
described on it (and particularly if it is with no wound, and death ha
been caused by twisting the neck), it may be presumed with almo
absolute certainty that the object of the murder was to appease
Thlen."

[179] It may be stated that, as far as I am aware in Assam, this supe
stition is peculiar to the Khasi and Jointia Hills, and it is not to be me
with amongst any of the other hill-tribes of the province. It would b
especially interesting to learn whether there are any traces of a simila
superstition amongst any of the tribes of Burma and Further India
The *Thlen* superstition is probably of a very ancient origin. It may b
said to take the place amongst the Khasis of the head-hunting custo
amongst the Naga. The *Thlen* superstition is still deep-rooted among
the people here, in many portions of the country the Khasis bein
afraid to walk out after dark for fear of being attacked by nonpaloinch
or persons who are searching for victims to sacrifice to the *Thlen*.

805 15. *Calculation of time.*—The Khasis adopt the lunar month
The names of the lunar months have been extracted from Colonel Bivar'
report below. I am not certain whether all Colonel Bivar's explan
nations of meanings of the names of the months are correct:

U Kylie-lyn-lut,—the wood-burning moon, corresponding wit
January.

U Symparg,—the windy moon, corresponding with February.

U Lyber,—the seed-sowing moon, corresponding with March.

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

however, regularly paid, as is done when cutting the stones for the funeral platform; while this work is in progress musicians are also entertained, and a continual beating of tom-toms (hand-drums) is kept up while the work is in progress.

That many of these monuments, and by far the larger number, are of great age, may be inferred from the fact that their history is quite lost.

As to their distribution, they are to be found over all the higher part of the range; the finest, certainly, in the central portion and in the vicinity of the larger villages, such as Cherra Poonjee, Juwai, Nurtiang, etc.

In Nongstoin, on the west, they gradually die out, and a few, not exceeding three or four feet in height, are to be found in the Khasia villages towards the Garo tribes, but at this limit the Langams come in, and their customs assimilate more with the former-named people. It is the same on the east and north-east of Jaintia; the stones set up are smaller and of rougher form, and by no means so numerous, yet they are to be seen in all kinds of out-of-the-way places quite overgrown with grass and jungle, where villages have not existed for years. Indications were not wanting, shewing that the country had been formerly much more populous, especially on the northern slopes of the Khasi and Janitia Hills. I have, on the other hand, never come across structures of the kind anywhere beyond the limits of Khasi-speaking people, that is, between longitude 91 deg. and 92 deg. 30 min., which includes the Jaintia Hills, the people of which part are called "Sintenge", differing in some minor points from the Khasis; the dialect is distinct, and there is so strong a type-form of likeness and expression, the two can be generally separated without inquiry. The same remarks hold good for the western side; a Khasi of the border Nongstoin villages can be told off at a glance: so strong are the great clan likenesses.

I have traversed the whole country on the east: viz., the North Cachar Hills, inhabited by tribes of Kookis and Nagas, and had the Khasi ever occupied permanently a larger area either on the east or west, particularly the former, emigrating, as they are supposed to have done, from that side, I think we might have expected to find, occasionally, remains of their imperishable monuments. The only exception that I know of occurs on the road from Nenglo to Hangrüng, in the North Cachar Hills district, beyond Asalu, a part of the country now in the occupation of Nagas, and formerly entirely in that of Kacharis, who are Bodos or Méchis. The road lies through forest, keeping along the high spur; at about two miles from the peak of Hemeo are to be seen several large slabs of stone nearly level with the ground, one ten feet by six, covering some sort of receptacle, for the ends of the

9: Godwin-Austen G-3 (to date) 1872 AR7 Khasi AR7

764
281
171

stones facing the sides are plainly visible. Near to these slabs is a platform with sides built up of rough stone, similar to those about Cherra Poonjee. Now Nágas bury their dead, and no monument is erected, the grave being dug in the village street, often at the very door of the deceased person's house, all the protection and covering being a rough one of bamboo or straight sticks interwoven and neatly pegged down all round with hooked sticks. Some tribes of Kúki bury, others burn, but I have never observed any stones set up, or used to cover the grave. There is just a possibility that the slabs on the Hemmo ridge are the remains of an old Khási settlement, occupied, perhaps, for a short period when on their emigration westward.

The largest collection of huge slabs and upright stones that I have seen anywhere in the Khási Hills, is at Laiksng-kote, the arrangement is so different in every way, that there can be little doubt that it was erected for a very different purpose, and was probably a place of meeting of the chiefs and elders of the clans. The steps to ascend it would indicate such a purpose, and we can imagine all the men of rank and influence seated around, and harangued by one of their number. I could never learn the history of this structure; although I made frequent inquiries, they could not say when or by whom it was set up. The stones, especially the large horizontal one, are of great size; this, with others, is of the granite found close by, but the hill on which the structure stands is an outlier of carbonaceous sandstone, horizontally stratified, and great labour must have been expended in dragging such huge blocks into their present position; for the slope to the top of the rise, though not great, yet is quite sufficient to render such work a formidable undertaking. The weight of the largest horizontal slab was twenty tons eighteen hundredweight, and of all the stones composing its construction eighty tons. The horizontal granite slabs were unhewn, as well as the highest upright monolith, which stood eighteen feet nine inches. Eight of the upright stones out of the eleven were of sandstone. The largest slab is an irregular oval in shape, thirty feet by thirteen feet in longest and shortest axis, with a mean thickness of one foot and one-third, standing nearly five feet and a-half above the ground, and resting on ten upright unhewn pillars of granite; on the south side are four other slabs arranged close to the edge of the large one, and round all rise the eleven upright pillars; on the eastern end are two other slabs forming steps to ascend by.

I give a drawing[1] of this very curious monument with a plan, and in an appendix the measurements of every stone, and these shew better than aught else the great massiveness of the work, and what an amount of labour these people must have expended in collecting the materials and setting them in this spot.

I. Setting and Economic Background of Sohkyndah and Kongton

361 Sohkyndah and Kongton are villages of the Kadashinong,[1] one of
632 the areas under the Cherra Chief. The Kadashinong is situated on
[151] the southern slope of the Khasi Hills, in what is called War country.
These two villages are situated at the farthest point from both Shella,
the centre bordered by the plain, and Cherrapunjee, the seat of the
Cherra Chief, one of the centres of the upland Khasi Hills. The people
186 at Cherrapunjee say that these villages are one of the most backward
121 parts of the Khasi Hills. They correspond to Rombagiri in the Garo
[171] Hills, as they lie in the innermost parts and more traditional economic
and social settings have been preserved there than in other villages.
These are also the reasons why I selected those villages as my field.

361 It is nine miles to Sohkyndah from Cherrapunjee, crossing five
[181] deep valleys towards the east. Kongton is located at the heart of
[487] the mountain ranges, ten miles from Cherrapunjee, towards the north-
east. It is about twelve miles from Sohkyndah to Kongton, and
[162] the way leads through one of the most difficult passes, where even
villagers seldom travel. In December, 1955, Sohkyndah was a com-
munity of 48 households (List 6), and Kongton of 62 households
(List 9). The settlements of both villages are clustered in the southern
[184] depressions of a mountain, not far from the summit, a typical location
of Khasi villages. Sohkyndah has poor soil, covered with plenty of
pieces of stones. The yield therefore is very poor. On the other
hand, Kongton, a much older village, enjoys fertile soil, and is one of
the most prosperous communities in the Kadashinong.

241 The major economy of both villages is shifting cultivation. We
have already seen, in the chapters on the Garo, the fundamental
632 technique of "burning cultivation." The difference between the
Garo and the Khasi shifting cultivation are to be found in two aspects:
[171] one is the nature of the crops and the other is the type of ownership.
[241] In this area, the main crop is millet, while that of the Garo is
rice. Besides the shifting cultivation, the Khasi have pan-leaf gardens
and sometimes pineapple gardens, though on a small scale and not
in every household. The most important feature of Khasi shifting
cultivation is the development of private ownership. In the tribal
areas in Assam, such private ownership of the jhum field is quite an

1 Kadashinong is the name of a group of villages. Its literal meaning is "twelve villages," and it comprises the following villages: Sohkyndah, Nongtalai, Mawkhanam, Mawshisat, Mawmang, Kongton, Shortung, Kodipurlum, Pim, Tandum, Nongtrong, and Dongkoi. (Khasi spelling follows the customary usage in Cherra State.)

15: Nakano E-5 (1955-1956) 1967 AR? Khasi AR?

necessary. The chances of acquiring a piece of land nowadays are 178
small, except for very successful men, and usually the size of the plot
is only just enough to maintain one household. When this land is 423
passed on to the next generation, the youngest daughter will hold the 428
title to it. This fact tends to exclude married elder sisters from the
right to use the land, since it is not sufficient for more than one house-
hold. Thus the ultimogeniture succession rule seems to have developed
more sharply and to have encouraged limited inheritance in conjunc-
tion with the shortage of land.

This tendency creates unbalance in the economy of the households 178
within a community. It is a usual picture in Khasi villages, for the
biggest and well-built houses to be occupied by the youngest daughter's 189
family, while the elder sisters reside in poor huts. Youngest daughters 423
are usually landowners, while their elder sisters have often to become 428
day-labourers after their marriage, unless their husbands are capable 556
men, or their fathers wealthy enough to give them some share of their
acquired property. On the whole, the variations at present between [171]
rich and poor are considerable in a Khasi community, in comparison
with that of the Garo, where the economic condition of each household
is a village is more or less similar. These differences are not only a
matter of economic organization but arise from the nature of each
social structure.

The economic and social patterns of Sohkynduh and Kongton are 193
very similar, but their dialects are slightly different: my interpreter, [124]
who came from Cherrapunji, could work quite well at Sohkynduh, but
at Kongton he found some difficulty, especially with the speech of
the old men, and with their religious expressions. The head man of
Kongton, who was quite accustomed to the Cherra dialect, acted as
an interpreter for us. Such difference in dialect in the Khasi Hills
are common phenomena, it is said that every valley has its own dialect.
Differences are found not only in speaking, but also, to a certain
extent, in culture and in social usages.

55. VILLAGE EXOGAMY

One of the outstanding features of Khasi social organization is 582
the predominant tendency of endogamy on the level of the village, 621
which contrasts with the structural orientation of the Garo village
exogamy. This is closely connected with the distribution of clans [71]
and the nature of the descent groups.

The Khasi population consists of a number of *kur*, matrilineal 614
clans, whose members consider themselves to be descended from a
common ancestress. The members of the same *kur* have a common [65] [69]

Chapter III

KINSHIP STRUCTURE AND ITS IMPLICATIONS IN VARIOUS FORMS OF MARRIAGE

I. Kinship Terminology and Selection of Spouse

The Khasi social structure differs greatly from that of the Garo, and one of the important differential elements is revealed in their kinship terminology. The Khasi kinship terminology does not show the structural significance of the marriage rules except for the basic distinction between own matrilineal kin, *kur*, and non-matrilineal kin, *kha*; this distinction serves to enforce the exogamous rule. 601 [171] *

All members of Ego's generation, including both maternal and paternal cousins, are classed as *pawa* (sibling), and those of Ego's child's generation as *khun*. In these two important generations, the generation principle is the basic pattern in terms of marriage. Cutting across this principle, distinctions of sex (*ka* for female, *u* for male) and order of birth (*iaid* or first, young or youngest, sometimes middle is added) are to be found. For instance, *ka-pawa-kur* is mother's sister's daughter, *u-pawa-kha* is father's brother's (or sister's) son. Wife is *ka-iaid*, and husband, *u-iaid*. The youngest daughter is *ka-khun-khadduh*.[1]

Though the terminology of Ego's and child's generations shows the generation principle, the matrilineal structure is reflected in the following points: apart from the distinction between *kur* and *kha*, 1) In the child's generation (*khun*), the matrilineal nephew and niece are termed *pawa* as well as *khun*, signifying the sociologically closest members of the child's generation. 2) *Kdi* is the most important kinship term among the Khasi, it designates the head (and potential head) of the descent group, i.e. the mother's brother. The mother's mother's brother is also termed *kdi*, just like among the Nayar the [171]

1. For further comparison, see U. N. Chowdhri, 1955.

15: Nakane K-5 (1955-1956) 1967 AR7 Khasi AR7

601 term *mama* for mother's brother designates as well mother's mother's
• [171] brother. *j)* Terms for mother's sister *(kwia)* and father's sister *(kia)* are different, and, needless to say, father's brother is called *kpa*, not *kia*. *g)* Mother's mother *(mawad)* is differentiated from father's mother *(mabba)*, though the grandfathers on both sides are termed *paral*.

582 As regards cross-cousin marriage, which, as we have seen, was an
601 essential part of Garo social structure, the Khasi have no institutional
[171] arrangements. The cross-cousin distinction is indeed found in the Khasi kinship terminology. Among those who are called *para* (sibling), an additional term is applied to cross-cousins (both matrilateral and patrilateral). They are called *babba*. However, this additional cross-cousin term should not be considered as indicating a preference
[171] for cross-cousin marriage. This is structurally different from that of the Iroquois type discussed in terms of Garo kinship terminology, in which a perceived cross-cousin marriage is involved. The term *para* (sibling) is more often used for them than *babba*.[1] Actually, among the Khasi there is no preference for cross-cousin marriage; rather there are even indications to the contrary, in that marriage with the mother's brother's daughter is not allowed during the lifetime of the maternal uncle. In the same way, marriage with the father's sister's daughter is not allowed during the life-time of the father.

582 In fact, the Khasi have numerous prohibitions of marriages between near kin on both paternal as well as maternal sides. The first and second parallel cousins are avoided. Those related to father within three generations are avoided. Within such a framework of marriage prohibitions, the use of a special additional term for cross-cousins is an indication of marriageable relatives within the framework of prohibition. This should not be considered to indicate a marriageable member in an active sense or a preference for cross-cousin marriage.

However, such marriages do sometimes appear in my census, for example, a man may have married a woman who is the sister of his brother's wife, or of his sister's husband. Thus sometimes between two descent groups there are more than two exchanges of men. But such relations are temporary and would terminate after one or two
582 generations. There is no structural continuity. My censuses of four
614 Khasi villages do show some tendency to marriages between two specific *kur*, but I consider this to be largely accidental. When the choice of an individual is random, but one or two *kur* are larger than the others, it will naturally follow that there will be a high frequency

[171] 1. Such use of the dual terminology is also found among the *Lani* and the *Trobriand*, (see the discussion, in pp. 154-155).

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

ship. They still live in the same familiar atmosphere as before their 581
marriage. The implications of this ambiguity in the married state are 593
considerable. Particularly the husband's uncomfortable situation, when the wife is heiress, encourages him to take marriage less seriously.

A husband who undergoes hardship in his wife's house, finds 581
himself as the authority in his sister's house; if he is not the authority, 591
he can find at least a respected position as uncle or brother. In the 592
case of a man of authority in the *iing*, the tendency for him to regard 593
his *iing* as more important than his married life is proportionately 602
stronger, as I will discuss later. Hence the most unstable and un- 604
successful marriages are those between the heiress and the man of 613
authority. This is one of the reasons we often find among the Khasi: 428
a brother or an uncle, who is already married, acting nevertheless as the head to a family *(iing)* and as a member of its domestic group. This means that he is in a state of temporary separation or divorced. Among the Ashanti, a man and his wife's brother are never found as [171]
members of a common household (Fortes, 1950, p. 262), but among the Khasi, on the contrary, a man and his wife's brother are often found as members of a common household. In such cases, however, the brother has no wife, or never brings his wife to his *iing*. Therefore, a man and his wife and his sister never reside together. As far as the residence of women is concerned, the Khasi keep to the strict descent rule; two women who belong to different descent groups never live together. This point differentiates the Khasi residence pattern, in which social structure is involved, from that not only of the Ashanti but also of the Yao where the head of a descent group can bring his wife to his sister's household, though, among other members, uxorilocal marriage is the rule. These differential aspects of matrilineal systems will be discussed from a more theoretical point of view later.

In addition, should a Khasi man even succeed in spending his life 602
with his wife's kinsmen, as soon as the wife dies, he will usually 613
return to his *iing*, that is, to his sister's house, where he is received warmly and where he often acts as the *de facto* authorithy, as in the similar situation of divorce and separation. Thus the strong matrilineal structural principle tends to orient a man towards his own descent group, the *iing*.

The man's attachment to his *iing* is very great throughout his 171
life. In this regard the Khasi differs from the matrilineal Negri 592
Sembilan Malay. Among the latter, returning to the matrilineal kin 602
is regarded by the man as an imposition rather than as the enjoyment 613
of a legitimate privilege (see Swift, 1958, p. 157).[1] This difference 428

1. He presents this fact as one of the reasons of the durability of marriage [581]
among the Negri Sembilan. Indeed, on this precise point they differ from the Khasi where marriage is rather unstable.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

171 592 602 615 428 seems to come *freely* from the different residential arrangement on marriage: among the Naga Semilian a man marries into his wife's group, i.e. his wife's village, being thus separated from his kin, and as a result of the physical absence of his wife's brother or maternal uncle in his domestic family, he enjoys considerable rights in his wife's household—as Smith states, he is 'master in his own house'. On the other hand, since among the Khasi the man stays in the village where his mother's (or mother's successor's) house is, even after his marriage, his relation to his natal house is preserved, secondly, from the structural difference of organization of the descent group. Among the Khasi, the *sing* is always the center of the descent group, based on uxorilocal succession and inheritance. Hence, the core of the descent group is always found physically in a particular household, whereas among the Naga Semilian, the descent group is not organized on a *household* level, but is a much wider organization, including apparently many households. Membership of an actual household and of a descent group are at different levels. To marry out and become a member of his wife's household means for the man the transfer of his household membership. Likewise, his sister's husband becomes a member of his sister's household. Thereby he becomes a secondary member of his sister's household after marriage though he keeps his membership in the descent group to which his sister belongs. Among the Khasi, membership of a descent group always corresponds to membership of a particular household. The Khasi man can always demand his rights at his natal house primarily, as he is a member of that descent group. But it should be noted that he has this right only in his mother's (or mother's successor's) household, not his other sisters' (non-heiress') and mother's sisters' households (unless one of them is successor of his mother), though they may belong to the same descent group. These matri kin's households are considered as separate *sing* (strict functional descent group) from his.

586 619 796 428 Indeed, sometimes a man cannot find his *sing*, because his mother died leaving no daughter to succeed her, or his sister died leaving no successor, and his *sing* became extinct. Such a case occasionally happens when a man becomes a divorcé or a widower as he is getting old. Then he has to face a serious social and economic condition. In divorcing, he has to leave everything he owned, his earnings including the house which he built, and even children . . . really he has nothing left him except his body.[1] Such a wretched man collects some timber and makes a small hut for himself, though sometimes kafs who sympathize with him help him to build it. Unless he finds some woman

1. A widower has an alternative solution—to remain in his late wife's household till he marries again, though his position is not comfortable there.

household are easily understandable in the light of the economic aspect of the fission of the ring. As I stated before, the nonfiction is given hardly any share of the property of her natal ring on her marriage (if the ring is rich a nonfiction and the wife may receive some part), and even if her new household happens to face serious economic difficulty, her natal ring, whose authority is vested in her brother, does not usually help her. This fact clearly suggests that brothers can have only limited rights over the other sister's ring.

This is the crucial point of the Khasi matrilineal system. The ring is a very restricted descent group giving opportunities to split off by those who have no right to inheritance. The ring has sorts of continuity without expansion in collateral lines. Therefore, even the siblings of the same mother do not always form a completely constituent unit of a functional descent group, since the other sisters are created by their marriages to form a new ring, though they may retain their membership in their natal ring. The central core of the ring is the particular sibling bond between a sister (the heiress) and a brother (the authority), a pair of statuses. Other sisters are really to have and other brothers are dual members, clearly differentiated in status from that particular brother (authority) and sister (heiress). This structural principle should be compared with other matrilineal descent groups, whose sibling group is based on interdependence between members of a group, not between particular persons or statuses. The structural unit of the Khasi social organization, is not the descent group based on sibling links, but the ring, though descent is the principal factor, and the limiting one, in the formation of the ring institution. The descent factor is delineated by the functional force of the inheritance rule through female ultimogeniture, which results in constant internal fission and segmentation in the descent group. Technically, it is very similar to the process of fission of the Garo sub on the uxoporous principle, though the internal structure is different.

The establishment of a new household by a Khasi woman with her husband, means the beginning of the establishment of a new ring, separated from her natal ring not only in residence but also sociologically. In other words, it is the process of fission and segmentation of an ring, matrilineal descent group. Therefore, a woman who has once established a new household independent of her natal household, will not go back to her natal home i.e. her mother's descent group, though her bond with her mother's descent group remains undiminished. Of course she may visit her natal ring occasionally, but in fact, much less than her husband will visit his natal ring. In this respect as well the Khasi manifest structural differences from the Ashanti as described by Fortes, where a mother goes back to her own matrilineal household and often prefers to reside there (Fortes, 1949 p. 77). Khasi

which I described previously, where a man brings his secondary wives to his first wife's house in which he is acting as the head. Furthermore, sororal polygyny is prohibited, while it was preferred among the Gusii's Gusii of wives taken from the same market, though mostly not real sisters. The strong jealousy, which I observed, among the Kisii wives of a polygynist, would appear to make such polygynous marriages with closely related women practically impossible. As shown in List 6 & 9 every single one of the wives of such polygynist belongs to different lineage, and the two secondary wives of the man of Kenyoro came from neighbouring villages.

These aspects of Kisii polygyny are related fundamentally to the underlying Kisii social structure. It should be remembered that every married woman has her independent household, ring, and that two women of different descent groups never reside together for a year. The picture is one of every married woman holding a key-point in the whole network of the social system, and men fit into this network with much flexibility. The strong mobility of women and the fixed nature of men in terms of residence naturally produces this form of polygyny. This analogy is also true of lovers' relations and illegal marriages. Though polygyny is a rapidly decreasing institution all over the Kisii Hills, cases of lovers' relations and illegal marriages are found to be very numerous among the Kisii, as compared with neighbouring tribes and peoples in Kenya.

Throughout my discussions of various forms of Kisii marriage, I found men who were more or less in the position wittily described by one of them as "having one leg in my sister's house, the other in my wife's," except in cases of the husband/father who succeeds in establishing paternal authority, as in marriages with a non-kinsman. Even in the latter a man might have a period of uncertainty until his children were born and until the economic basis for his matrimonial life was firmly established. For the men, Kisii men would be in the position of either becoming the authority of an ring, or managing between their sister and their wife, which may produce more opportunities for lovers' relations. One of a man's legs is certainly always found in his sister's house, the other may not in his wife's, but it may also not in another woman's house. The wife being rather accustomed to his occasional absence due to his visits to his sister's house, another kind of absence does not mark any great change from the usual situation, at least not physically. Such situations occur particularly in the earlier stage of the marriage, as a sort of continuation of premarital affairs, which are quite freely practised. It is a usual custom before marriage for young men to sleep at a girl's house whom they like though they say sexual intercourse usually does not take place in such cases. This I observed in Ichigwatoto and Kengoro.

5 A

I

[2] The discussion of Parts I and II reveals that the social structure
[3] of the Garo and the Khasi differ greatly. Similarity is found only
[4] at the level of the minimum criteria of matrilineal systems: the basic
[5] succession rules of mother-daughter, mother's brother-sister's son,
[6] and the fact that property is owned by the woman, but the controlling
power and authority over it are in the hands of the man.

One of the most outstanding structural differences between the two lies in the composition of a property group: the property group of the Khasi is formed by a descent group at a shallow generation depth, while that of the Garo is maintained by the cooperation of two local lines, each of which represents a localized lineage group. Hence the descent group of the former tends to have stronger solidarity, whereas the latter tends to be weakened in its solidarity.

In a broad framework, in terms of social organization, the Garo fall structurally into a category based on the moiety arrangement, in which patrilineal systems, such as the Murngin, and the Karieri, etc., are also to be found. Theoretically, this type of mechanism is operative in either matrilineal or patrilineal systems by the exchange of men in the former and the exchange of women in the latter.

On the other hand, the Khasi system presents more outstanding features of a type which is generally accepted as belonging to matrilineal systems. However, the basic structural traits of this system may also be found among patrilineal systems, in terms of relatively stronger descent group solidarity.

Fig. 10. — Succession Lines of Female and Male in Matrilineal Kinship System.

Lines A and B may include unlike-sexed, and brother-sister relation respectively, the numbers of characteristic subgroup variations in these minor groups depend on each matrilineal system.

Though both matrilineal and patrilineal systems may share such basic structural categories, they differ significantly in the following respects: in matrilineal systems, the ownership of property and the authority over the property group never rest in one person, as in the case of the father-husband of the patrilineal system, and the succession to these two offices follows the female line (mother-daughter) and the male line (mother's brother-sister's son) as shown in line A and line B in Fig. 10. This duality of office-holding individuals within the succession rule is the intrinsic cause

2. FUNCTIONING OF MATRILINEAL SYSTEMS

of complications and variations in matrilineal systems. The matrilineal system is not a mirror of the patrilineal system; it is a different system in which more complicated mechanisms are involved. This complexity of the matrilineal system is a decided handicap when it comes to meeting radical economic changes. In order to preserve the system, a fairly stable economy is required, well-balanced in its population and resources. This may be one of the causes for the rapid disintegration or instability of social organization of matrilineal peoples in the world.

The difficulty of preserving in function both lines *A* and *B* is caused by residential problems—individual marriages which contradict the sibling cohesion. According to my theoretical analysis, there are four alternative ways of resolving such contradictory factors, each one being represented by actual ethnographic samples.[1] Each arrangement represents a different degree of the function of the two lines *A* and *B* in relation to the residential pattern, as following (see Fig. 13):

● ●, [illegible]

○ ○, [illegible]

[illegible]

Fig. 13. — Central Case of Matrilineages in Relation to Property Groups and Residential Groups

The Garo type. The residential type is 'husband-wife' instead of 'brother-sister.' The function of both lines *A* and *B* is equally strong. This is kept by the marriage contract between two local lines, so that it is possible to keep the function of each line against the residential separation of the two lines in one descent group. This type is found at the moment only among the Garo.

1. In this discussion I take only such major matrilineal samples for which sufficient documentary [illegible] is available.

The Nayar type. The counter scheme of the Garo type, the uxorilocal type is 'brother-sister' instead of 'husband-wife'. The function of both line A and B is equally strong. This type is found among the traditional Nayar (except those in North Malabar) and the Mosuo(Moso matrilineal people).

The Khasi type. The ideal uxorilocated type consists of a woman with either her husband or her brother. The function of line A is much stronger than that of line B. This type is found among the Khasi, the Hopi, the Ute, the Tsimshian, the Nagi-Sentinel Hills, the Tiwa, etc.

The Ashanti type. The ideal uxorilocated type consists of a man with either his wife or his sister. The function of line B is much stronger than that of line A. This type is found among the Ashanti, the Gonndo Tonga, the Mafonde, the Tsimsamik, the Nayar of North Malabar, etc.

In terms of the strong function of both lines A and B, both the Garo type and the Nayar type may fall into a similar category. But as already explained, their structure basically differs from one another, and clearly appears as the counter schemes of different uxorilocal arrangements. The Nayar type shares with the Khasi a rather similar structure in terms of a descent group equated with a property group, while in the Garo type the two lines A and B of a single descent group never form an independent property unit.

If, leaving with the Garo type, we consider the three others, the Nayar type appears quite different from the rest in so far as in it, both lines fulfill an equally strong function, while in the Khasi and Ashanti types, one of the two lines is always more developed functionally than the other. The Nayar type presents the highest degree of descent group solidarity among the three. This Nayar situation might be compared with that of the traditional Chinese patrilineal systems.* In both social systems the structural importance of marriage is minimized: the role of a spouse is only to insure descendants of the matrilineal (patrilineal) group. The structural importance of a husband (wife) is almost neglected, while the wife (husband) holds the paramount force to her (his) descent line. The descent group manifests the strongest solidarity within itself, neglecting affinal relations with other groups. This principle results in the custom of the "visiting husband" in the matrilineal system, and, in the patrilineal system, in a total social shift of the wife by her complete assimilation into her husband's group, and separation from her descent group—she has no social and personal independent being in terms of the structure. It is an interesting fact that the most extreme schemes of highly institutionalized matrilineal systems can be seen among societies of pre-industrialized high civilization. These schemes are structurally opposed to those of the system of the majority

* Parsons touches this point in his paper (Parsons, 1949, p. 108).

611

arrangement, such as the Garo and the Mangin, where both wife and husband keep important social positions as representatives of each descent group.

Leaving the Garo and the Nayar types, the following discussion deals with the implications of the difference between the Khasi type and the Ashanti type. The degree of function of the two lines *A* and *B*, is related to the residential arrangement. A household of the Khasi type includes the matrilineage women and either their husbands or brothers—brother's wives are excluded as a rule. A household of the Ashanti type includes the matrilineage men and either their wives or sisters—sister's husbands are excluded as a rule. Among the Khasi as I have already explained (p. 137), a woman and her brother's wife are never found as members of a common household, while among the Ashanti, as Fortes states, a man and his wife's brother are never found as members of a common household. In the former, since a woman is the center of the matrilineage, her husband stands solidly closer to her matrilineage than she does to his—the husband shares the matrilineage dwelling, while a man being a peripheral member, his wife is excluded as a rule from his matrilineage residence (hence predominantly uxorilocal);[1] the Ashanti type exemplifies exactly the opposite case (predominantly virilocal or avunculocal).

The crucial point in which lies the difference between the Khasi and Ashanti types is the rule of inheritance. In matrilineal systems, as a rule, the ancestral property is inherited by the matrilineal descent group. The starting point of the difference is really in the ways of inheritance of the *acquired property* particularly by the husband. So long as a man remains with his matrilineage members, both types show no difference. The crucial difference appears in the married life. In the Khasi type, if a man builds an independent house in which to live with his wife and children, that house and his acquired property during his matrimonial life automatically belong to and are inherited by his wife and children. On the other hand, in the Ashanti type, if a man builds an independent house in which to live with his wife and children, that house and his acquired property belong as a rule to him and are inherited by his matrilineal group, not by his wife and children. In case of divorce or death of a spouse, the difference between the Khasi and the Ashanti types appears most clearly: in the former, it is the husband who leaves, and in the latter it is the wife and children who leave. Hence the residence pattern reflects

1. Referring the Tiwa (Lowa) group, which I classify into the Khasi type, it seems therefore that a husband who is selected for the position of head of a matrilineal family, takes his wife with him. This method of marriage should be considered as an exceptional case applied to only such a particular condition. Such special arrangement is also found among the Nayar where fraternal arrangement is general rule.

these rules, as the Khasi type tends to a matrilocal arrangement, while the Ashanti type tends to a virilocal or avunculocal arrangement.[1]

In the Khasi type, the residential arrangement is the decisive factor for a man's economic achievement. The men, though they keep close social and ritual ties with their matrilineage, are divorced economically from their matrilineal descent group.[2] On the other hand, in the Ashanti type, where the matrilineal rule is the decisive factor, men keep strong social, ritual and economic ties with their descent group at the expense of the women's and children's residential mobility. However, these women are not like men of the Khasi type; as among the Ashanti, women mostly go back to their matrilineage at a late stage of their married life. In the case of the Tachibanda, the wife stays all her married life at her husband's house while her sons go back to her matrilineage, and her daughters leave for their husbands' house at their marriage. This can be considered as the exact opposite of what happens in the Khasi type. The matrilineage represented by men keeps its function and solidarity at the expense of the women. There, the female line (mother-daughter) is broken, in practice, by the residential arrangement, as was broken the male line (mother's brother-sister's son) in the Khasi type. The actual tie of the Tachibanda wife to her matrilineage is maintained through the presence her brothers and her, not through mother, sister or daughter. That of the Khasi husband is maintained through his youngest sister or mom, not through his brother or nephew. Thus Tachibanda wives and Khasi husbands are marginal members of the matrilineage. These facts show that they sacrifice either the male (B) or the female (A) line to the cohabitation of wife and husband. Unless they have a structural arrangement like that of the Garo, the cohabitation of the married couple is the crucial factor which modifies the matrilineal system.

The Ashanti manifest great mutability in this respect, since they do not like to sacrifice either line A or B, though actually line A is much weaker than B. The mother wishes to be with her daughter and son, while the mother's brother wishes to be with his sister's son, yet they do wish to have cohabitation in their marriage—combining theoretically opposed factors. This is also the case which I found among the Nayar in the transitional stage of the disintegra-

1. These arguments do not mean that all members of a society act in the same way; in any society, considerable variations in residential pattern are found in individual cases. What is important here is the model, and the orientation of most of the people, the actions of which is usually followed by the majority of the people in a given society, or a given time.

2. Among the Khasi, though the authority of the ring may have the account and manage his sister's property, he acquired property through his wife's field or his independent economic activity ordinarily go to his wife and children.

Garo AR5

tion of the matrilineal system (see Nakane, 1958(B) and 1964). In comparison with the Ashanti, the Khasi or the Trobriand type gain considerable stability by sacrificing either *A* or *B* line, which is one of the possible ways of preserving the matrilineal system along with the practice of co-habitation of the married couple.

Another solution of the conflicting situation in such a society is the practice of cross-cousin marriage, as in the case of the Ashanti, which brings two conflicting factors together, the matrilineage and the family of procreation. In this case, the cross-cousin marriage tends to take place between the first cross-cousin centred around such unit. Fortes states, "Cross-cousin marriage most often occurs between the children of full-siblings or of uterine first cousins . . . cross-cousin marriage offers a possibility of reconciling the conflicting influences of conjugal, parental, and matrilineal kinship ties" (1950, p. 262). This is quite different from the cross-cousin marriage of the Garo, because among the latter, the cross-cousin marriage being practised as the basis of the whole structure of society, it makes no difference whether a cross-cousin is first or classificatory. In the case of the Ashanti and other matrilineal systems of a similar type, such as the Wayombe and the Kongo, it is considered most desirable to enter into a first cross-cousin marriage; classificatory cross-cousin marriage, such as among the Garo, does not make much sense. Moreover, the cases of cross-cousin marriage tend to take place among comparatively wealthy members in a society (see Rattray, 1927, Chapter XXIX). If one has no property in the Ashanti type society, then cross-cousin marriage has not much meaning.

The cross-cousin marriage of matrilineal systems has been often referred to as being the solution to the conflicting situations of a man as a husband and as a brother. I suggest here that this can be applied to the matrilineal system of the Ashanti type, not to those of the Khasi type where men have already given up the role of forming the central core of the matrilineage. In these societies, the solution is already given through the sacrifice of one line. There are no conflicting economic factors, though men are still in a situation of social conflict between their matrilineage and family of procreation. This hypothesis is confirmed empirically by the fact that there are no prescribed or preferential cross-cousin marriages among the Khasi, the Hopi, the Zuni, the Trobriand and the Nayar (similar Wolcy.[1] where a man is not in economic conflict with his matrilineage and family of procreation. His nephews are already outside his economic

1. "In arranging marriages the preference is for someone 'near'. As cross-cousins are the nearest possible naturally a large number of these marriages occur . . . This preference, however, is not explicitly institutionalized . . ." (Gough, 1958, p. 130).

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7 Garo AR5

K 9 171 182 611

scope; due to uxorilocal marriage, they have no right over his residence and his acquired property. Naturally the maternal uncle becomes far less important than in the Ashanti type.

Among the Yao, which I classified as belonging to the Khasi type, Mitchell states that in spite of the emphasis laid on cross-cousin marriage by his informants, real or classificatory cross-cousins are found in only 15 per cent of 103 first marriages (Mitchell, 1956, p. 200). The functional importance of cross-cousin marriage among the Yao is particularly evident in the minority (headmen of villages or lineages) who practise virilocal marriage[1] in a society where a uxorilocal arrangement is the general rule; as in the case of the Ashanti, cross-cousin marriage functions as a solution to two conflicting tendencies: matrilineality and virilocality. The Trobriands, though they belong to the Ashanti type, demonstrate the same structural analogy to the Khasi type, though in reverse. Among Trobriand commoners there is no preference for cross-cousin marriage. The much discussed cross-cousin marriage of the Trobriand aristocrats should be considered as the exception, as has already been examined by Leach (1958, p. 139). In this regard the Yao and the Trobriands produce a picture somewhat similar to the Ashanti type, among the minority of society, though the general practice bears similar features with that of the Khasi type.

It has become clear that cross-cousin marriage is closely related to the type of residence, i.e. virilocality, combined with economic factors. Furthermore, the cross-cousin marriage signifies the political importance of the maternal uncle as lineage head. Thus the Khasi type and the Ashanti type represent alternative arrangements to the different locus of the core of the functional body, the matrilineal descent group.

II

K 9 171 182 615

The preceding section has made clear different types of matrilineal systems so far as the internal structure of the descent group is concerned. This section deals with the relation of the descent group to the external organization.

Both the Garo and the Khasi follow a unilineal system, but they do not have what is called "segmentary lineage" organization, which has been much discussed in the African field. As generally understood

1. Richards states, among the Tao-Cewa group, a cross-cousin marriage is likely to be found between a daughter of a head (male) of a descent group and his sister's son (Richards, 1950, p. 139). Mitchell states that Yao cross-cousin marriage is one of the solutions for the conflict between the principle of uxorilocal marriage and the principle of male leadership of the lineage (Mitchell, 1956, p. 199).

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7 •
Garo AR5

lineage is a corporate unilineal descent group of which the members can establish demonstrable genealogical relationships to each other. According to Firth, "lineage is essentially a unilineal descent group with some corporate functions, normally related by segmentary process to other descent groups of the same type, and with them usually comprising the entire society" (1957, p. 4). The Garo and the Khasi can thus be said to have the lineage, but to lack its segmentary organization which normally is found in a unilineal society. Both social structures exemplify the importance of the residence as a functional unit, against the wider descent group which may be called the lineage group.

In the case of the Garo, the localized lineage is expressed in terms of the village (or group of villages) whose land bears the name of the localized lineage. However, it is the village which acts as the functional corporate body, the economic and ritual unit, not the group of members of the localized lineage. The village theoretically consists of the members of the two localized lineages, as represented in the headman and his wife respectively. Practically, though it bears the name of a particular lineage to which the wife of the headman belongs, as also usually the majority of the inhabitants, it includes many other lineage members as well as the traditional two lineages. Therefore, the lineage is not, in this sense, an exclusive corporate unit with a ritual and economic function, though it gives a theoretical framework to the structure.

In the case of the Khasi, the lineage is found only on a household scale, centred in the woman, the property owner with members having direct matrilineal kinship ties to the former, such as her brothers, elder sisters, sons and daughters, who may or may not reside in the same household—the members of the *ing*. Beyond this unit (the *ing*) one can hardly find any functional organization based on the descent system. In other words, the lineage becomes a functional unit only at the level of the household, e.g., the lowest level of segmentation of the descent group, and it lacks wider external organization by the same principle. The clan is considered rather as a ritual conception implying exogamy, not as an organized body of kin.

These phenomena contrast sharply with the Hopi and the Ashanti social organization, where lineage organization has crucial importance either than on a household level. Many factors can be considered in this connection. First of all, the locus of property and communal unit are the most distinctive features. Among the Khasi, property and communal units are always found in an *ing*, represented by the youngest daughter's household, while that of the Hopi and the Ashanti are in a wider lineage organization in which members of many households are usually included. The Zuni pattern seems also similar to that of the Khasi. The difference between the Khasi and Zuni lies

15: Nakano E-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

x
9
191
182
592
673

in the rule of inheritance, the former follows uxorilineal (uterine-positive), while the latter does not. Therefore, the number of members of a Zuni household is naturally larger than that of the Khasi.[1] Against the average number of a Khasi household, four to five, that of the Zuni is seven and a half to eight persons (Kroeber, 1917, p. 144). Among the Khasi, sisters separate through marriage in every generation, leaving the youngest in their natal house, while Zuni sisters may stay together even after their marriages. Kroeber states:

"The house belongs to the women born of the family. They come into the world, pass their lives, and within the walls they die. . . . Now and then a new dwelling may be built by all the women, or for a girl of the house by an enterprising husband, but in general the same walls, or rebuilt ones on the same spot (ibid., pp. 47-48). . . . It is true that a Zuni 'house' often contains what we should regard as two or three households, but so long as it includes only one used hearth, and all natives insist that the two or three households are a single one" (ibid., p. 114).

The internal composition of the household may differ from that of the Khasi, but the household in terms of the important institutionalized unit, is very similar to the Khasi. Li Anche states that "characteristics of a joint household based on the kinship principle stand out very strikingly" (Li, 1937, p. 75). Eggan's statement brings Zuni social organization much closer to the issue. He writes, "In terms of Kroeber's table it would seem that the Zuni tend to equate a lineage with a household, except in cases of recent expansion or building off" (Eggan, 1950, p. 189). He gives a further illuminating analysis of this point:

"We have noted that the lineage principle. . . . also provides a mechanism for the inheritance of ceremonial duties and obligations and the transmission and preservation of fetishes and other ceremonial paraphernalia. In Zuni the inheritance is phrased in terms of the household, but it is clear that it is the lineage segment born into the household that is important. This lineage segment, or at least the female line thereof, also owns land and holds it in trust for succeeding generations, to be worked by the men who marry into the household" (ibid., p. 197).

Another similar equation of lineage and household, comparable to that of the Khasi and the Zuni, is found among the Trobriaus. According to Goodenough (1956):

1. This involves not only the difference of the number of members in a household but also the relation between the members of a descent group. As already discussed, the core of the descent group among the Khasi is the pair of siblings, the owner of the property (the youngest sister) and the authority (a brother); yet the sibling group altogether (see p. 139) is known in other matrilineal societies appearing in this discussion. In regard to the uxorilineal principle itself, the Zuni share the same system as the Khasi, though it appears to operate differently by reason of the structural difference of organization.

13: Nakano E-5 (1955-1956) 1967 AR7 Khasi AR7 *
Garo AR5

"In aboriginal times they used to be associated with most lineages a dwelling house, *iaw* (p. 63) . . . *iaw*-is the corporate property of the lineage or element (no whose women live in it), but it is normally built by their husbands" (p. 63).

E
4
M1

Here, it is clear that a household provides the major locus of a lineage. In other words, a lineage is a corporate property group with a common residence. This is also the case of the Nayar *tarwad* and the Nitanghakhas *pawi*, though in these cases the household excludes the spouses of its members, while with the Khasi, the Zuni, and the Trobriand the spouses (in most cases, the husbands) share the residence.

Though they may differ in scale and size from one society to another, as well as from one household to another, the functional lineage founded upon residence has thus a similar range in all of these systems. For convenience sake, I tentatively term this type of lineage "household-lineage,"[1] as opposed to that of the Hopi and the Ashanti, which might be termed "segmentary-lineage."

The average number of Khasi and Garo household members is four to five, that of the Zuni seven and a half to eight as stated above, the Trobriand is eighteen (three to thirty-four in Kiriwina Island, according to Goodenough), while the Nayar range from thirty to two hundred. These differences, I think, mostly depend on the economic (and environmental) situation; they should not be regarded as structural, except for the Garo and the Khasi, which, because of the uxorilocal rule, have smaller and fairly uniform households. The wide range of variation in composition which we observe among the Trobriand and the Nayar is due in reality to economic and environmental factors: the more favorable the circumstances, the larger the unit.

The co-residential group and the property unit do not always necessarily correspond. One property group may consist of more than two independent residences. But even in such cases, the lineage is likely to be found in a group which formed a co-residential unit in the recent past, and which should be considered as marginal cases, derived from the recent fission of a group—it is a lineage in process of fission not a constant kin-group based on wider organization such as we find among the Ashanti and the Hopi. Usually such a lineage ceases to function shortly after it loses its common property, which usually follows closely upon the fission of the residential unit. Thus, in the course of time a once-recognized lineage group disappears into the common sea of the clan, which represents only a ritual and exogamous unit. In some cases, even this clan loses its function, as happens among the Nayar and the Minangkabau, among the lineage which

1. It should be noted that it does not mean that the lineage consists of household members, but that the lineage solidarity is found around the range of a household unit.

corresponds (or corresponded in the near past) to the co-residential property-group itself becomes an exogamic unit, disregarding the wider unit of the clan. Structurally it can be said that in these societies a lineage cannot exercise its full function unless it has a common residence based on a property unit.

In contrast to these societies, I cannot help but think that the Ashanti and the Hopi belong to a different type. Both Fortes and Eggan lay great emphasis on the descent principle, based on the ethnographic data of the Ashanti and of the Hopi respectively. The best examples of statements concerning this issue are the accounts in which both stress their disagreement with Kroeber's argument of 1938 in favour of the priority of local residence relationships over those of descent, under the title of "Basic and secondary patterns of social structure."

Fortes states:

"A lineage cannot easily act as a corporate group if its members can never get together for the conduct of their affairs. It is not surprising therefore to find that the lineage in African societies is generally locally anchored, but it is not necessarily territorially compact or exclusive. A compact nucleus may be enough to act as the local centre for a group that is widely dispersed. I think it would be agreed that lineage and locality are independently variable and how they interact depends on other factors in the social structure. As I interpret the evidence, local ties are of secondary significance, pace Kroeber, for local ties do not appear to give rise to structural bonds in and of themselves. There must be common political or kinship or economic or ritual interests for structural bonds to emerge. Again spatial dispersion does not immediately put an end to lineage ties or to the ramifying kin ties found in cognatic systems like that of the Lozi. For legal status, property, office and cult act centripetally to hold dispersed lineages together and scattered kindred" (Fortes, 1953, p. 30).

Eggan states:

"For the Hopi the kinship structure is centered primarily around the lineage; the household relationships are secondary (Eggan, 1950, p. 103) . . .

"Furthermore, it is the lineage and clan, rather than the household group, which is invested with lands and ceremonies and which is considered to own the house itself. Important as are the ties of residence and inheritance associations, they are not the key groupings in Hopi ceremonies—or in terms of our interpretation.

"Kroeber explicitly leaves kinship out of account in his analysis of 'basic and secondary patterns of social structure,' but in a sense kinship is more fundamental than either patterns of residence or formal grouping. Our analysis of Hopi kinship has suggested that both the household and the lineage organizations are encompassed in the kinship system. And it is clear that the kinship system is expressed in terms of the lineage principle rather than in terms of residence" (ibid., p. 122).

These arguments seem to me to refer more to a difference of social organization than to a theoretical contrast. On the basis of my own

15. Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7 *
Garo AR5

field work as well as on the accounts of various matrilineal systems. I feel strongly that there must be different types of systems which may be distinguished as "household-lineage" and "segmentary-lineage". Fortes and Eggan postulate the pre-eminence of the descent principle over residence. Though this may be the case among the Ashanti and the Hopi, it does not fit the cases belonging to what I call "household-lineage" type. Firth's argument emphasizing the importance of rights to group membership being associated with locality, fits very well with the latter case. With more precision and subtlety than Kroeber, he argues that "residence by itself does not give title to descent-group membership, but land rights established by descent-group membership tend to remain operational only through residence" (Firth 1957, p. 75).

I believe there are crucial differences between these household-lineage type and segmentary-lineage type organizations. The technical process of fission into segments is similar in both types. But in the former, once a segmented group attains autonomy, the relation between the segments will easily be forgotten after a few generations, as it has no significant social implication. Among these societies, people's genealogical memory outside the residential group is surprisingly poor. This empirical fact also suggests a different structure from that of the segmentary system.

In both types of society the internal organization of a household is the same, but it differs externally. Eggan states that "Kroeber's and Parsons' statements about the lack of system in regard to Zuni kinship indicate judgment from some arbitrary standard" and adds "The concept of the lineage provides a bridge between the household and the clan" (Eggan, *ibid.*, p. 197). I cannot agree with this. In fact, my study of the Garo, the Khasi and the Nayar corresponds very well to the Zuni situation described by Kroeber and Parsons. There are matrilineal systems which lack a bridge between the household and the clan.

Then what is it that makes the difference between the two types of organization in similar matrilineal systems? I am not sure that I can produce at present effective hypotheses on this issue. However, empirical facts show that the household-lineage type organization is likely to be found among more complicated societies or in a society with considerable mobility. This we gather also if we compare the village compositions of the Hopi and the Zuni. In the case of the Khasi, we saw that there was considerable mobility in population even in [illegible] villages, so that we easily understand that in such a condition lineage membership hardly maintained itself. This seems to agree with the view put forth by Fortes on segmentary systems. Fortes says the limits of the spread or span of internal segmentation of the

13: Nakane E-5 (1955-1956) 1967 AR? Khasi AR?

has a striking resemblance to that of the Hopi as described by Eggan. The lineage, having segmentary structure, performs strong functions as a land ownership and religious unit. However, from Kathey's account, we understand that all grandchildren of matrilineage as well as children through the male line, are called nana, a term which is also applied to grandparent's generation. This means that the lineal classification does not extend beyond the second generation from Ego; such a classification corresponds to the Zuni type, but not to the Hopi type.

Coming back to the discussion of the correlation between the restricted type of kinship terminology and household-lineage, we should consider another important aspect of its bilateral character. In these societies can be observed considerable bilateral tendencies reaching beyond the household-lineage. As I have made clear in the description of the Khasi, the social and economic relationship with outside members of the household are no different towards people who belong to the same descent or clan than towards those who belong to an entirely different kin-group, except as concerns directly related kindred, such as sibling and mother and children. The matrilineal group wider than the ing has no exclusive function at all except avoidance of marriage. In this level of organization, there is no extension of the organizing principle of the matrilineal descent system. For instance, households A, B and C are matrilineally related to each other (A is the original and B and C the outcome of the fission of A). Such matrilineal links have no exclusive features that mark them off from other households unrelated through the matrilineal descent line; actual matrilineal links are minimized in their value and function in regard to relations between households. Such characteristics of this kind of organization must be correlated with the existence of an inheritance case, in which the matrilineal rule is distorted as I mentioned elsewhere (p. 125): if there is no daughter to succeed the ing, the son can inherit the acquired property of the ing, thus creating by transmission of the property, an entirely new ing (of his wife), in which no matrilineal link is established. Likewise in Trik, a son is the potential heir of his father's lineage, and frequency of patrilocal arrangements as alternatives—transmission of the property on the establishment of a new property-residential group—does not always follow the strict matrilineal line. These facts point to considerable bilateral characteristics outside the household. The relationships among households are not organized upon the matrilineal principle.

Kroeber's emphasis on the bilateral character of the Zuni society should be regarded as important in this respect:

"Upon her (Zuni woman) permanent occupancy of the house rests the matrilineal custom of the tribe. But kinship is thoroughly and equally bilat-

Such variety in residential arrangements and such flexibility in inheritance rule complicates considerably the composition of the residential unit when a property group (residential domestic unit) grows. Richards gives an interesting illustrative description of the formation of a Bemba residential unit:

> "The Bemba bridegroom starts his married life as a stranger in his wife's village, but since his daughters remain with him for some years after marriage to build up a grand-family composed of his daughters, their husbands, and their children. In some cases he is able to persuade his son-in-law to remain permanently with him, while in others he is even able to keep his son in his own village. In time some of his sister's sons, with their wives, will choose to come and settle with him, so that he will be head of a group of rather heterogeneous composition" (Richards, ibid., p. xxi).

Here we find a man's wife's matrilineal kin (his daughters and sons, including the daughters' descendants), his own matrilineal kin (his sisters' sons), and the third matrilineal sets (his sons' wives and his sister's sons' wives). Such a mixed composition of a residential unit may never be found among societies belonging to those types previously discussed, such residential composition would be impossible if the matrilineal principle was functioning strongly in the structure of the actual property group.

Thus, the Bemba type presents an outstanding structural difference from the other types of matrilineal systems in which the matrilineal inheritance rule was the decisive factor for the formation of the residence unit. It is clear that in the Bemba type, both a man and a woman are fairly free from the economic control of his and her matrilineal group, and their relations are somewhat like those of the husband of the Khasi type and the wife of the Ashanti type. Therefore, the conflicts between one's matrilineal group and family of procreation are minimized, particularly in the economic sphere.

This analysis throws much light on the following remarks of Richards bearing on different aspects of the similar formation of descent groups among the Yao and the Bemba.

> "The head of a Yao village of this sort (taking his wife to his matrilineage residence) thus has authority over his wife's children and over those of his sisters, but the position of the wife's children seems to be clearly differentiated from that of the sister's children, and Mitchell speaks of a traditional hostility between them. I never saw evidence of such hostility in Bemba villages, which also often contain a man's children and his sister's children" (Richards, ibid., p. xxi).

This difference should really be ascribed to the structural difference between the Khasi type (the Yao) and the Bemba type. In the former the matrilineal structural force is strongly functioning in the residential group, whereas in the latter it is minimized.

Within such a matrilineal framework it is quite understandable that the predominance of uxilocal arrangements, coupled with male authority or husband-father, are found. All observers of these societies have noted this feature. Among the plateau Tonga and the Bemba particularly, male authority is outstanding.

"Men are free to move and to form their own households because they acquire rights over their wives which permit them to remove these women from the protection of their kin. . . . As head of the household, the husband occupies a position comparable in many respects to that which falls to men in patrilineal societies." (Colson, 1958, p. 96)

"With the marriage the husband obtains—but only for the probationary period—rights over his wife's labour, the right to control her movements, and rights to her sexually. He is the father of any children born to her, whether or not he begets them . . ." (ibid., p. 100)

"As long as the household contains a married couple, it is theoretically under the authority of the husband. The wife and her children form the house, the uxoria, but the husband is known as the uxoratis, 'the owner of the house' . . ." (ibid., p. 102)

"Once the young man is admitted to the family he is free to move his wife and children to his own village should he desire to do so." (Richards, ibid., p. 103)

"This is a male dominant society and, even though descent is reckoned through the mother, the wife is very much under the control of her husband even while he is an outsider in his wife's village." (ibid., p. 103)

The husband-father's authority was also observed among other matrilineal systems under certain conditions, as already fully discussed in the chapters on the Garo and the Khasi, and more predominantly among societies of the Ashanti type where the matrilineal system was well-established. However, the unilineal structure on the level of the household composition may give more opportunity to create a husband-father authority of a more stable kind, unhampered by matrilineal force.

Furthermore, individuals are almost free from the descent principle in establishing their residence. Colson states in her account on the Tonga that a man has complete freedom to choose his residence, and residents in a single neighbourhood need not have kinship ties with one another. In the ordinary round of daily life, membership within a neighbourhood may be of more significance than membership within a matrilineal group (Colson, 1958, pp. 27-28). Oliver describes a similar situation:

"The non-marrying women and their children acquire proprietary rights in huts where they reside, and ultimately acquire full title to such huts" (Oliver, 1955, p. 109).

It is clear, in these societies, that there are two sets of groups on different levels: a matrilineal group membership of which is acquired

15: Nakane E-9 (1955-1956) 1967 AR? Khasi AR? *
Garo AR5

000 devices of the existing system. This does not necessarily imply that such societies have or had the same organization as other matrilineal societies, but I believe this to be an economic and historical product of the existing structure. I do not question the fact that all these societies are subject to a process of change; but it does seem unnecessary to assume that every factor which happens to be missing nowadays, did, in fact, exist in the past.

Summing up the above discussion, the essential structural differences between the Bemba type and other matrilineal systems are found firstly in the internal structure of its property group: "unilateral" contrasting with the "matrilineal" of the Garo, Nayar, Khasi and Ashanti types. Secondly, in the structure of the wider organization of the residential group: the clear matrilineal principle is found to act in the composition of matrilineal groups. The focus of the matrilineal operation is quite opposite to that of the household-lineage type. In the latter the bilateral features are met with at the wider organizational level. In the Bemba type, in spite of bilateral features in the composition of the residential property group, the rigorous matrilineal group conception is found in the wider organization. Unlike the case of the segmentary-lineage type, this matrilineal group does not have necessarily a direct and actual economic basis. Perhaps the scale of the Bemba society is small enough to maintain the matrilineal social system without a definite economic basis.

In conclusion, such terms as "matrilineal" (unilineal) and "bilateral" are simply convenient labels for the preliminary classification: they should not be used as contrasting criteria for classifying social structure. The unilineal principle (matrilineal system) works differently in each given society, producing as I have observed different structures. Again, *descent* principle and *residence* (with landholdings or property) are equally important criteria for the analysis of social organization. The prominence of either descent or residence should not be theoretically opposed in the arguments of anthropologists, for different degrees and levels of both factors are involved in each given society.

Finally I should like to note that the five major types of matrilineal systems in relation to the internal structure of the property group, which I presented in this discussion, namely the Garo, the Nayar, the Khasi, the Ashanti and the Bemba types, give theoretical criteria for the analysis. It should not be assumed that all matrilineal systems grouped into the same type present the same structure, but that each possesses the important basic elements of its type. Also a system may change from one type to another through important economic changes or migrations: for instance, from the Nayar type to the Ashanti type, or from the Ashanti type to the Bemba type.

19: Nakane E-5 (1955-1956) 1967 AR? Khasi AR?

197 648 771 995 people remained non-Hindu in their basic beliefs and social customs. Hindu influences are nevertheless predominant in their culture, especially in their way of living which shows a practical adaptability, somewhat similar to the Japanese acceptance of modern western culture without becoming Christian. In my census of Shella village, the people calling themselves 'Hindu' amount to 40 per cent of the total, but they are the recent converts to the Ramakrishna School which established a missionary station at Shella after the Partition. The Christians constitute 30 per cent of the total, most of them having been converted during the last ten years, as in the case of the Ramakrishna School.[1] The rest remain as they were, of Khasi belief. These conversions to either Ramakrishna or Christianity seem to have been encouraged by the unstable situation of the people resulting from the recent economic depression in this area.

[197] [162] [459]

The Partition of India and Pakistan in August 1947, which drew the borderline a few miles south of Shella village, considerably upset village economy by stopping all trade with Bengal, though a limited amount of trade is allowed with local people at the border. Because of this political change, all the produce of Shella gardens is rotting away for lack of markets, while all of the rice fields were taken by Pakistan. Goods now come to Shella only from the uplands, carried upon men's shoulders over the most difficult pass, which makes everything very expensive. Many families have sold their gold and other treasures, and some families are facing starvation.[2]

499 458 648

Concerning the conversion to a new religion, an interesting phenomenon is to be observed. The conversion to Christianity or to Ramakrishna is mostly by individual. I found in my census that the wife and husband often belong to different religions. This is a very different picture from the Garo, among whom I always found that the husband and wife belonged to the same religion: the conversion of the husband to Christianity was always followed by that of the wife. I think this reflects the structural differences which influence the actual relationship between the husband and wife. Among these Khasi, instead of the husband and wife, the maternal uncle and his nephews and nieces are mostly of the same religion. The function of the sing, the most important social and religious unit, thus appears also in the conversion to a new religion, stronger than that of a domestic unit.

182 171 592 613 771 995

Intermarriage

The close economic and cultural contact of the Shella people and the Bengalee is not matched by social contact. The essential barrier between the two peoples is the difference of religion which dominates the entire social order in each society. Though these Khasi were important traders, richer than the neighbouring Hindu peasants, they were considered by the Hindu as outcasts with whom they never shared social activities. Intermarriages were therefore very rare. In Shella village, only two exceptional cases were found in my census:

648 771 563

a. A Khasi woman married to a Gurka (cattle-keeper); they live at Shella Bazaar (Sholap).

b. A Khasi woman has marital relation with a Bengalee medical doctor who has resided at Dawng in Shella for six years. He already has a Bengalee

1. These two entirely different missionary activities are competing with each other, and are somewhat related to the political powers within this area.

2. The state government is doing its best to provide them with additional facilities for example, providing air transport for the transportation of oranges from Shella to Gauhati and Calcutta. However, such arrangements cannot cover the great economic loss suffered by the Shella people.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

178 like the Zemi-Naga, the Cacharee and the Kuki. But after the period of
563 economic prosperity as I shall describe in the next section, the Jatinga people
621 reached a rather high level of education, while most of the neighbouring tribes
[871] remained illiterate. Their standard of living likewise improved. Fashionable girls of Jatinga who have studied at the Convent school in Shillong, and speak English and Hindi, cannot marry half-naked tribesmen who work in the jungle. They prefer to intermarry with Moslem, Panjabee or Assamese who belong to amore sophisticated community, and through whom they can enjoy urban life. Thus the orientation of the intermarriage of the people of Jatinga has changed, along with the growth of Jatinga.

It should be noted that intermarriages came mostly through the contacts at Haflong, where people used to go once a week for the bazaar, rather than through direct contacts with neighbouring villages.

Economy of Jatinga and its Relation to Neighbouring Tribes.

178 It is very interesting to find two different kinds of economy in the same
171 ecological background: Jatinga Khasi practise pan-leaf and orange cultivation
245 and depend mainly on a trading economy, while the other neighbouring tribal peoples practise jhum cultivation, almost a subsistence economy. This situation has remained unchanged for the last fifty years since the establishment of Jatinga village.

101 The first Jatinga immigrants occupied one ridge of the mountain where the
245 present Jatinga is situated. Formerly, this land belonged to the Zemi-Naga, one of the old inhabitants of the Cachar Hills, who possessed a vast jungle area for jhum cultivation. It seems that there was no objection to the Khasi occupying this small spot: it was apparently too small an area for the jhum cultivator —pan-leaf cultivation of the Khasi requires less than one twentieth of the land of the usual jhum cultivation. The Khasi who started pan-leaf cultivation were able to accumulate some capital, and after several years they started orange gardens. They had had experience of orange cultivation in their homeland, but this was the first time they had operated commercially.

245 The success of this orange cultivation was beyond their dreams. Hearing
434 of good oranges at Jatinga, many Bengalee merchants from Dacca, Sylhet,
439 Silchar and Gauhati began to come to buy them. Moreover, the village had the great advantage of being situated near the railway station. Oranges were sold by carloads. Unimaginable wealth came to the Jatinga people. Especi-
[496] ally the founder's family, including his brother's and sister's, became extraor-
[871] dinarily wealthy; their income used to be Rs. 20,000 a year. The children were sent to the school which was established in the village and some were educated at colleges in Dacca, Sylhet and Shillong. The villagers had
[362] beautiful houses built by Manipuri and Bengalee carpenters. Actually the houses of Jatinga were known as some of the best construction in Assam.

Like the Shella people, they were managers of gardens and employed workers.
245 Wealthy households used to engage several labourers annually, most of them
46 from Jaintia where the Jatinga people had originated. These workers were provided with shelter in the servant quarters of their employer's house, but they had to provide meals for themselves. They were paid daily according to the work done. They were available to other households, when their employer had no work. Some labourers were also engaged locally among the Zemi-Naga, the Cacharee and the Kuki, though not as many as among the Jaintia.
245 These local tribes were fairly well occupied by their jhum cultivation, and not
464 used to being employed as workers. Therefore, most of them were not regular

on from October to December. For millets the seed is sown in April-May and reaped about six months later. Maize is usually sown in April-May and ripens in August-September. For potato, generally three crops are raised in the district: the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

For oranges and lemons the orchards are cleared of weeds twice a year. Harvesting of orange takes place from October to January. Breakfast ripens at the beginning of the year and are collected between February and May.

2.6.3 Agricultural implements.—The usual agricultural implements are a hoe, a sickle, three or four kinds of dao, a harrow, a cycloid which is used for the construction of irrigation channels, 'sieves' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Bhoi area and remaining the one in use in the plains of the State.

2. 6. 4. General cultural practices.—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

2.7 Cottage Industries.—Cottage Industries, it appears, have not found very great favour among the people of the district. A few families here and there manufacture iron implements, earthenware, pottery, baskets, mats and jewellery. In striking contrast with other districts weaving of cotton clothes is rare among the Khasis. The Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir Hills practice it only for their domestic consumption. At present, the Government is trying to popularise weaving in the district and this has been welcomed by the Khasis. Among other cottage industries production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

2.8 The People.—The Khasis and Jaintias are a short sturdy race distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour, they are free from any inhibition. Side by side with the Khasis live the Mikirs, Garos and Nepalis who form respectively 7.32 percent, 3.28 percent and 2.27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

2.9 Occupation.—The greater portion of the population of the district subsists on cultivation. More than 75 percent of the rural households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

favourably with an average attendance of 844 in the preceding year. Of the pupils on the rolls, 130 were professed Christians, 98 Hindus, and 1098 Khiddis. The total cost was Rs. 3105. 11. 6, or £310. 13s. 3d., towards which Government contributed Rs. 3048. The average cost of each pupil was Rs. 2. 3. 3, or 4s., of which Rs. 3. 14. 7 represents the share paid by Government. The chief failure among the Khiddis is stated by the Inspector to be in arithmetic. Four primary scholarships were awarded during the year by the Deputy-Commissioner, on the recommendation of the secretary to the Mission. These scholarships are of the value of Rs. 3 a month, or £3. 10s. a year, and are tenable for two years.

Middle English Schools.—There were four schools of this class during the year under report, with 227 pupils on the rolls, and an average daily attendance of 159. The total expenditure was Rs. 4380. 15. 9, or £438. 4s., towards which Government contributed Rs. 1456. 8; the average cost of each pupil was Rs. 18. 15. 3, or £1. 17s. 8d.

Female Instruction.—The Khasi and Jaintia Hills is the only District of Assam, and one of the very few throughout all India, in which female instruction can be said to exist. During 1872-73 the number of girls attending the schools increased from 122 to 322, or by more than 40 per cent., showing 4·7 girls at school to every thousand of the female population, as opposed to 4 in the Province generally. Of this number 24 were taught by Mrs. Hugh Roberts of Cherrá Púnjí, and 18 by Mrs. John Roberts of Shillá. During the year five of the girls were sent out as teachers, of whom one was placed in charge of the Shillong girls' school, which has 29 pupils.

Normal School.—According to the classification adopted by the Education Department, the institution at Cherrá Púnjí, under the management of the Rev. Hugh Roberts, is described as partly "Government normal" and partly "aided English." In 1872-73 the number of pupils on the rolls was 43, and the average attendance 35. There is a class of 10 girls, and of the 18 teachers turned out during the year, 3 were girls. The total cost was Rs. 4132. 6. 4, almost the whole being paid by Government. The average cost of each pupil was Rs. 109. 0. 3, or £10. 19s., of which Rs. 107. 2. 11 represents the share of Government. The following paragraph, quoted from Mr. Roberts' Report, illustrates what the missionaries have effected, and also the difficulties with which they have to contend:—"Cases have been brought to my notice during the past year

[For information on the rune monuments of the Klimt hill tribes see site categories III and 7da, specifically in regard to sources in Gudwin-Austen and Ob Gudwin-Austen.]

[176]
[177]
[178]
[179]

shows were very much as we find them at the present day among the Naga and Kukis, beyond and bordering our present eastern limits, the land of unknown tribes. They are now the quietest, most peaceful, and successful of all the hill people on the eastern frontier.

In my former paper I did not allude to the caves in these hills, which I am inclined to think are works of greater age than the stone structures. The caves in question have long since been given up, for I could not obtain any satisfactory account of them. They are only to be seen on the northern side of the Khasi plateau, and Dr. Hooker, in his account of his trips to the Kalling Jinch, did not fail to notice them. About Mawsaj and towards Bangmara they are very numerous, and always occur on commanding situations. On the path leading down the grassy spur to the stone monumental pre-viously described, near Jangjirti, in a very few days I caught of a cave, about eight feet high. They are usually quite horizontal mounds of earth; but this one is lined all round on the face with slabs of stone about four feet high; they are frequently not higher than six feet. A distant view is shown in Plate 6.

[72]
[73]

Zemlaw is there one cave of the earth that forms them having been excavated alone by, in most, therefore, have been carried in some clear distance, to avoid unsightly heaps near the structure. I should much like to have dug into one of these caves, but was afraid to hurt the feelings of the people by doing so. They are very probably excavated of an earlier form to form now made of stone, and this point is might be interesting to clear up.

Beyond the Khasi area no caves are to be found, at least I had never some intercourse with visiting North Hamjyer last winter (1874-75), where, at the head of the Jingkai river, on the direct road from Samagurig, are four fine caves, all lined with large boulders. They are old, and the Naga now living in the village near said they had been made by another clan of Naga, who long ago had gone further north, and the site of whose village had been lately re-occupied by Kukis.

[118]
[119]

Mr. C. B. Clarke, in a paper read lately before your Institute, refers to the different forms of the structure in the Khasi Hills; but he has not quite estimated the subject, as yet further than I did, although with regard to the disposal of the dead he gives some further interesting particulars.

[114]

As I think that drawings are of very great interest, and better exhibit the many different forms of bone depository or cistern that have been adopted at different periods by tribes inhabiting localities very far apart, and often quite unconnected ethnically,

[126]
[164]

I give a sketch of a form of cinerary meeting attention, and are hitherto unique (Plate iii.). Several of this form may be seen on a low spur near the Dame of Jaddo or Shillong. The cinerary is above ground, and stands on a slightly raised platform. It consists of five thick stones about three feet high, set on edge, and capped with a heavy tegmentum; and, as far, it resembles the small form, a figure of which is given in my first paper.* The approach to all these depositories is from the natural by several low steps, and the whole structure is enclosed on three sides by large flat slabs (or the rough) standing on end—the longest being placed round the cinerary itself, overtopping it by three to four feet, and the remainder, three diminishing in size, stand on either side of the steps. There are about six such monuments along the ridge of the spur, and I have seen no others similar elsewhere. They have been broken into, and the front stone removed, very probably by some followers from our regimental bands, which is close by. There is thus a double probability of their ultimate destruction altogether, should the station be extended in that direction.

Explanation of Plates II. and III.

Plate II.—View of megalithic monuments at Jingrahai, near Shillong, Khasi Hills. From a photograph taken by Rev. W. Bryant.

Plate III.—View of main stone cinerary and approach, at Shillong, Khasi Hills, with entry in the distance, by the author.

Discussion.

The President said that the paper of Lieut. de Crespigny on the Missions of Burma, contained a great deal of extremely interesting information, especially in relation to their religious customs; the author, however, attempted to connect the Bilaans with the inhabitants of Tibet, through the similarity of their religious beliefs. He (the President) did not venture to express any opinion on this point, not being any grounds for forming one. He thought, however, that, as a general rule, evidence of identity of race, derived from the comparison of the religions of savages, must be received with caution, especially in the absence of any information as to physical conditions. The attention that is devoted to religion arises from the interest that is taken in the subject, rather than from the value of the evidence it affords of connection with other peoples. There must always be a great liability to error in the accounts of the religious customs of savages. Inquiries into the peculiarities of the arts of different peoples, about which there could be no mistake, were, he thought,

Sheet ABT

of more scientific value, and the translation given by the author in this paper would, no doubt, be found of great use to comparative philologists. He hoped that the Institute would be favoured with some further information on the roots of Bhoopa from Major-Gen. Cunningham.

With regard to the paper by Major Godwin-Austen, he (the President) could say his communications were always welcome to the Institute. He wished that a more detailed account had been given of the intercourse referred to. There appears to have been a great map-building period in the life of some race when neighbouring tribes were constantly at war, and each had its strongholds in case of attack. Such maps are conspicuous amongst the antiquities of nearly all parts of the world, and a comparison of the different systems of defence adopted, when viewed in the knowledge of the use of communication which we possess, affords valuable evidence of psychical connections. In the early British maps of this country he had never seen any evidence of the use of flanking defence except at the entrances, but the description given by Major Austen of this earthwork appeared to indicate that something of the kind was known to these people.

villages, such as Shella, Borpunji, Umsiah, and in Nongpoh in the Jaintia Hills.

Origin.

The origin of the Khasis is a very vexed question. Although it is probable that the Khasis have inhabited their present abode for at any rate a considerable period, there seems to be a fairly general belief amongst them that they originally came from elsewhere. The Rev. H. Roberts, in the introduction to his Khasi Grammar, states that "tradition, such as it is, connects them politically with the Burmese, to whom king they were up to a comparatively recent date rendering homage, by sending him an annual tribute in the shape of an axe, as an emblem merely of submission." Another tradition points out the north as the direction from which they migrated, and Sylhet as the terminus of their wanderings, from which they were ultimately driven back into their present hill fastnesses by a great flood, after a more or less peaceful occupation of that district. It was on the occasion of this great flood, the legend runs, that the Khasi lost the art of writing, the Khasi being his book whilst he was swimming at the time of this flood, whereas the Bengali managed to preserve his. Owing to the Khasis having possessed no written character before the advent of the Welsh missionaries, there are no histories as is the case with the Ahoms of the Assam Valley, and therefore no record of their journeys. Mr. Shadwell, the oldest living authority we have on the Khasis, and one who has been in close touch with the people for more than half a century, mentions a tradition amongst them that they originally came into Assam from Burma *viâ* the Patkoi range, having followed the route of one of the Burmese invasions. Mr. Shadwell has heard them mention the name Patkoi as a hill they met with on their journey. All this sort of thing is, however, inexpressibly vague. In the chapter dealing with "Affinities" have been given some reasons for supposing that the Khasis and other tribes of the Mon-Anam family, originally occupied a large portion of the Indian continent. Where the actual cradle of the Mon-Anam race was, is as

Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

impossible to state, as it is to fix upon the exact tract of country from which the Aryans sprung. With reference to the Khasi branch of the Mon-Anam family, it would seem reasonable to suppose that if they are not the autochthons of a portion of the hills on the northern bank of the Brahmaputra, and if they originated to Assam from some other country, it is not unlikely that they followed the direction of the different irruptions of foreign peoples into Assam of which we have authentic data, i.e. from south-east to north-west, as was the case with the Ahom invaders of Assam who invaded Assam from their settlements in the Shan States old the Patkoi range, the different Burmese invasions, the movements of the Khamtis and, again, the Singphos, from the country to the east of the Hukong Valley. Whether the first cousins of the Khasis, the Mons, moved to their present abode from China, whether they are the aborigines of the portion of Burma they at present occupy, or were one of the races "of Turanian origin" who, as Forbes thinks, originally occupied the valley of the Ganges before the Aryan invasion, must be left to others more qualified than myself to determine. Further, it is difficult to clear up the mystery of the survival, in an isolated position, of people like the Ho-Mundas, whose language and certain customs exhibit points of similarity with those of the Khasis, in close proximity to the Dravidian tribes and at a great distance from the Khasis, there being no people who exhibit similar characteristics inhabiting countries situated in between; but we can, I think, reasonably suppose that the Khasis are an offshoot of the Mon people of Further India in the light of the historical fact I have quoted, i.e. that the movements of races into Assam have usually, although not invariably, taken place from the east, and not from the west. The tendency for outside people to move into Assam from the east still continues.

Appendix.

The late Mr. S. E. Peal, F.R.G.S., in an interesting and suggestive paper published in the Journal of the Asiatic Society of Bengal in 1896, drew attention to certain illustrations of

1:Cordon E-4, 9 (no date) 1907 AB? Khasi AB?

648 occurring in the Siemship, these *lyngdohs* and two *mantris* assemble and decide who is to be Siem. They then summon the sirdars of villages to meet them in *durbar* and obtain the approval of the latter to their nomination. If the sirdars do not approve, the combined durbar then decides who is to become
1?? Siem. In Nongpoyng there is a tradition that two sisters, Ka
643 Jah and Ka Jem, came to the village of Nongpoyng, which was then ruled by two *lyngdohs*, and that the latter, having ascertained that the two sisters were of equal birth, married them. They then travelled to other villages and obtained the consent of the *lyngdohs* of these villages to the formation of all their villages into a State, of which Nongpoyng became the capital, and over which U Sugi Shaling, the son of Ka Jem, was appointed Siem by the five principal *lyngdohs*. After some generations the lyngdoh of Mairang with his villages became subject to the Siem of Nongkhlaw, an event which finds mention in the annals of the Nongkhlaw State as the conquest of the territory of the "Black" Siem of Nongpoyng. Another lyngdoh was appointed in place of the one whose territory had been thus annexed.

642 In the Mawiong State the ancient custom was that six headmen
[643] appointed the Siem subject to the approval of the people of the
644 Siemship. In the Nongkhyah State there are two Siem families, the "Black" and the "White," from either of which it has apparently been the custom for the people to select a Siem, as they wished. In Mawryngkang the electors of the Siem are the heads of the four principal clans in the State. On a recent occasion, the electors being equally divided regarding the appointment of a Siem, it was necessary to appeal to the people of the State. In Langrin there are, as in Maharam and Nongkhyah, two main branches of the Siem family, i.e. the
[641] "Black" and the "White" Siems. Here there is no special electoral body; all the adults of the state have the right to vote at the election of a Siem. In Bhawal State Siems are appointed by the heads of eight clans whose decision is apparently final, provided that it is unanimous. In Malai-Sohmat a bare majority of the heads of six clans would be sufficient for the election of a Siem. Presumably both in Bhawal and Malai-Sohmat, if the electors were equally divided, there would be an appeal to the people.

1: Gordon E-4, 9 (no date) 1907 AR? Khasi AR?

to difference. It is owing to these three different names being used for the same people that there has been so much confusion about Lyngams previously; e.g. at one course they were named Lyngam, at another they received the appellation of Garo, and at a third enumeration they were called Khasis. In Section I. the habitat of the Lyngams has been roughly defined. It is impossible to define the Lyngam country exactly, because these people are continually shifting their village sites owing to the exigencies of jhum cultivation, which has been described in Section II. Some of the Lyngams preserve a tradition that they originally came from the Kamrup plains. It is interesting that a people, like the Garos in so many respects, should have the same idea as the Garos as to the hills on the south bank of the Brahmaputra not always having been their abode. The Garo legend is that they dwelt for some years in the Goalpara and Kamrup plains after they descended from Thibet, and before they moved to the Garo Hills; and there is unmistakable evidence of their occupation of both districts in the shape of certain Garo villages on both banks of the Brahmaputra for some little distance up the river. If, as I suspect, the Lyngams are an offshoot of the Garos, it is, perhaps, possible that they entered the Khasi Hills south in the same way as the Garos entered the hill district to which they have given their name. The Lyngams are much darker than the Khasis, and possess the Thibeto-Burman type of feature often to a marked degree. It is not extraordinary that they should have adopted some of the Khasi customs, for the Khasis, being the stronger people, would in course of time be bound to influence them in this respect. That the Lyngams observe the matriarchate and erect (some claim) memorial stones is not peculiar, because the Garos, like the Khasis, are also a matriarchal people (to a limited degree), and the custom of erecting memorial stones is not confined to the Khasis, for other hill tribes in Assam observe the practice, e.g. certain Naga tribes and the Mikirs; and the Garos themselves put up carved posts, called *bima*, in honour of the departed. Although there is not much intermarriage between the Khasis and the Lyngams nowadays, perhaps in days gone by there was a mixture of blood, the result being the hybrid race we are now

   b) Second Burial (maw phew).
   c) Third Burial (maw bah).

I. Religion in General

1. Gods, Spirits, Souls.

•173 771 An explanation about the origin of their religion is not to be expected from the Khasi themselves. Since they do not have a system of writing, nor idols or temples, one must turn entirely to their oral traditions.

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

nounce the hard G; and in all words of Hindustani origin this letter has the sound of K. 101 [197]

They are called by the tribes of Kúkis and Nágás on the west "Káro", the name they themselves have for the whole mass of hill people on their western side, the Gáros, though as we pass towards their confines, we find the names of local clans giving way to this general term which was not known to some of the villagers of West Nongstoin, who call the Gáros "Dékor."

The Gáro appellation for the Khásis is "Dikkil" or "Digil"; and it was very interesting to find, after visiting the villages of both, that they mutually fear each other, and consequently border raids never occur. The Gáros owned that they feared the bow and arrow of their neighbour, a weapon they themselves are unacquainted with the use of.

The Khásis always point to the east as the quarter from which they emigrated, but there is very little, if any, similarity with the languages of the people now occupying the hills on that side. [178] [197]

Before entering further on the subject matter of this paper, I must request my hearers or readers to remember that having no knowledge colloquially of the Khasi language, the information I give was obtained from natives who understood either English or Hindustani well. The greater part of the information was given me by a very intelligent man, a native inspector of schools in the district; thus I hope that all errors that exist may be hereafter corrected by others who have been able to elucidate with greater exactness the meaning of their many different rites and superstitions. 115

Certainly the most striking objects of interest in the Khási Hills are the upright stone monuments that are to be seen all over the country; these, set up by the wayside, or in the villages, more frequently cutting the sky on prominent hills, with the large slabs horizontally set before them, at once recall the Druidical remains of our own island, northern France, etc., and lead one to marvel at the similarity of the customs, and to inquire its origin and design. Many who visit those hills take it at once for granted that they are the graves of illustrious men, or, after a vain endeavour to get some information from the coolies about them, let the matter rest, or finally believe that the ashes of the dead, to whose memory the monoliths are erected, are buried under the flat kind of altar or dolmen seen in front. 764 211

It is always a very difficult matter to obtain information from semi-civilised people on such a subject as their religious rites, especially if the inquirer is ignorant of their language. A slight knowledge of Hindustani on the part of the Khásia villager, renders the attempt still more hopeless, and the information given quite erroneous.

[P. 106 B]

1963-2b: 2; Raeth 1962.] **Demography.** According to the 1961 census of India, the United Khasi-Jaintia Hills District contained 221,982 Khasis and 67,532 Syntengs. Pnars and Jaintias (India [Republic] 1962-57). These figures, together with those for Khasis enumerated in Cachar (4,005), Mikir and North Cachar Hills (407), Lakhimpur (287), Sibsagar (279), and Darrang (211) districts, and those for Syntengs enumerated in Mikir and North Cachar District (464), yield a total of 295,224 Khasis. **History and cultural relations.** Khasis believe that they had supernatural origin in Khasi Hills (see Gait 1926: 280 for historical evidence, and Raly 1930: 5-9 for myth, but see also Costa 1986, 1989; Gordon 1907: 10-11, and Chatterji 1953: 12). Khasi tradition also states that in early times they moved gradually from east to west, from Jaintia toward Khasi Hills, in the practice of swidden agriculture (Gatphoh 1947: 97-98). The salient fact of known Khasi history, which begins generally in the mid-sixteenth century A.D. when there already existed the present-day 25 native Khasi chiefdoms, is the distinctive line of development followed by the separate kingdom of Jaintia. To the north, Jaintia was successively tributary, in part or in whole, to the Kachari kingdom (ca. 1250 A.D.), the Koch kingdom (strongest ca. 1500 A.D.), and the Ahom kingdom (strongest ca. 1700 A.D.) (Shakespear 1914: Map 1). To the south, about 1500 A.D., Jaintia extended its rule over a tract of Sylhet, which was populated by Hindus and Muslims, and saw its kings fall thereafter under Brahman influence. In the early 1800s, Jaintia became involved in the fratricidal strife then prevalent in the ruling family of Manipur. In 1835, after the Jaintia king ignored British warnings not to seize British subjects for human sacrifice, Jaintia was punished by the British annexation of the Jaintia parganas in Sylhet. The Jaintia king then voluntarily turned over to the British the hills area of his domain, so that the whole of Jaintia became part of British India and, in 1860, came to be taxed as such, although the Jaintias were otherwise allowed to maintain their traditional system of village government. • By contrast, the remaining Khasi states had few formal external relations until British times. Khasis resided and traded in both the Brahmaputra and Sylhet valleys, but were basically turned inward on their own hills, where warfare between villages and between the states was apparently common. Khasis came into indirect relation with the British in 1765, when Sylhet and its markets became part of British India. In the 1790s, stepped-up Khasi raids into Sylhet caused the British to throw up a deterring line of forts along the foothills. Later, it became necessary to place an embargo on Khasi products in the Sylhet markets. In 1827, the British penetrated into western Khasi Hills by negotiating with the Khasi chief of Nongkhlaw State to build a road through his territory, linking the recently annexed Brahmaputra valley with Calcutta. For three decades

sense) or juxtapositions of roots which have not thereby suffered 197
either obscuration or absorption—that is to say, they are all, 193
with a few exceptions, reducible to their constituent root words, which are still "current coin," and retain their power as independent vocables. The cases in which obscuration and "fusion" of roots have taken place are confined to—(1) the noun prefix *jong*, expressing abstract ideas; (2) the verbal prefixes *hyn*, *kyn*, *lyn*, *ryn*, *syn*, *tyn*, *pyn*, *hyr*, *kyr*, *lyr*, *pyr*, *syr*, *tyr*, expressing causation, intensification, and contrariety. The language is found purest at Cherrá Punji. The Khásiás have no written character or literature of 212
any kind of their own. Tradition says that all was lost while they 173
were yet masters of the plains, whence they were driven by a general catastrophe or deluge to their present fastnesses in the hills. The following works on the language have been published: *Khási Grammar*, *Anglo-Khási Dictionary*, *Khási Primer* (Parts I. and II., 113
with Vocabulary),—all issued by the Calcutta School-Book Society; *Khási English Dictionary* (in preparation), and an *Anglo-Khási First Book*.

'CUSTOMS REGARDING INHERITANCE.—A Khásiá, whether married 428
or single, if he makes his mother's house his home, is said to be earning for his *kur*, *i.e.* for his mother, or his brothers and sisters, or his mother's relatives. On his death his property goes to his mother, if living; if not, to the grandmother; if she is not living, then to his sisters; should his sisters also be dead, to his sisters' children. Should the deceased have left no sisters, the property goes to the
2 brothers; should he have no brothers or should they be dead, the property descends to his aunts, or to their children if the aunts are not living; should the aunts have left no children, the property descends to the grandmother's or great-grandmother's sisters or children. The property of a female on her death goes to her mother, if the deceased have no children; or if the mother of the deceased is not living, the property goes to the brothers and sisters; if the sisters are dead, then their children become the heirs. If there are no such children, the property devolves as in the case of males. When a man is not living in his mother's house, but in that of his wife, he cares for his wife and children. On his death his property descends to his wife, with the exception of the ornaments and clothing worn by him during his lifetime, which go to the brothers and sisters or other relatives of the deceased. Should the deceased have been a widower, the property goes to his children, and in their absence

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U' Siang (one of

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

249 my informants at Padu), in the year 1933, is said to have begun the cultivation
173 of yam (*shwir*) and millets (*kner*) in the then uncultivated slopes. He and
[115] his people used to be, on this account, ridiculed as monkeys (*shrieh*). The Nonglamin clan took later to pan-leaf-, and arecanut-cultivation and became one of the richest landowners of the Wár-country. Others followed and imitated them. This clan (*kner*) is now residing at Nongtalang, about ten miles east of Pada in the Wár-Jaintia slopes.

174 This possibility of a comparatively recent origin of the now economically
184 independent Wár-groups among the Khasi speaking peoples is of importance
601 to the question of some different terms in kinship terminology which the following lists will show.

184 Comments on other features in the relationship terminology, bearing
601 on sociological or historical problems of either among the four Khasi speaking groups under discussion, are being hinted at in the text of the lists itself and further discussed in Part Three of the present paper, following the lists of kinship terms.

1: Gurdon E-4 5 (no date) 1907 AR7 Khasi AR7

and offered to help them with their cultivation. The Khasis also refused her, saying they were capable of managing their own cultivation, and at the same time told her to go to the country of the Bhois and Syntengs, i.e. the Jaintia Hills. Acting on this advice, she went to the village of Nongphyllud in the Jaintia Hills, where the people again turned a deaf ear to her. She proceeded to Mulagula village in Jaintia, at the foot of the Jaintia Hills, and ascended from thence to Rymbai, where she met a man who conducted her to the house of the Siem, who consented that she and her children should live with him. Ka Taben then apportioned to her children various duties in the house of the Siem as follows:—Ka Rasong was to look after the young unmarried folk, and was to supervise their daily labour and to prosper their trading operations at the markets. Next Ka Rasong was given a place at the foot of the king post, *trai rishot*, and her duty was to befriend young men in battle. Then came *Ka Longkhuinruid*, alias *ka Thab-bulong*, who said, "There are no more rooms in the house for my occupation, so I will go and live in the forest, and him who turns not his coat when I meet him I will make mad." Finally came *U Lamsymphud*, who elected to live with his youngest sister inside the house.

There are special sacrifices offered to these household deities. The leaves of the *sning*, or Khasi oak, are wrapped round the post of the house, and a fowl is sacrificed and other formalities are observed which it would be tedious to describe in detail. The legend of the arrival of Ka Taben with her children in the Synteng country from a distant clime is interesting in that it perhaps indicates the possibility of the migration of these people, i.e. the Syntengs, in ancient times from some distant place to their present abode.

ANCESTOR-WORSHIP.

The Khasis not only revere the memories of deceased ancestors, but they adore them by means of offerings, which are sometimes periodical, and sometimes made when thought neces-

says that the MoBrCh but not the FaSiCh is prohibited (1897: 2), but Gurdon says that the MoBrCh is eligible after the death of MoBr, and that FaSiCh is eligible after the death of Fa (1907: 78). Nowadays both types of marriage occur, whether the linking relative is living or dead. **Residence.** Residence is either duolocal or matrilocal under the roof of the wife's mother until the birth of one or two children. For a man married to a youngest daughter, it then continues to be matrilocal. For men married to other daughters, it becomes uxorilocal; there have also always been cases of virilocal residence, and it is now common to find neolocal residence in Shillong. For non-Christian Jaintias, it is duolocal throughout the marriage. **Domestic unit.** The domestic unit is the elementary family, though for a youngest daughter it may temporarily include also her aged mother, aged father, unmarried siblings, or divorced or widowed brothers. **Inheritance.** Traditionally, after the Khasi mother had helped each of her daughters to build and supply a house when each one married and had children, her only real obligation to help them economically was ended. Everything she possessed, excepting certain personalty that was destroyed in her cremation, was inherited by her youngest daughter. Failing daughters, a woman's property reverted to her next youngest sister's daughter. Today, this pattern is often modified by putting more property into the hands of older daughters and even sons. [Cf. Cantlie 1934; Becker 1924.] **Divorce.** A woman may effect numerous and usually brief separations from her husband by simply closing the door of her house to him, whereupon he returns to the house of his mother or youngest sister. Divorce, however, must be initiated by mutual consent. Divorce is very common, even though women resist it because they do not wish to lose a provider, and men because they do not wish to lose their children. Formerly it was accomplished by a simple ritual in the presence of witnesses, followed by public announcement by a town crier. Now, the witnesses and the public announcement have been dispensed with, and evidence for divorce consists only in the word of the parties concerned.

835 [114] [178] 591 592 428 [178] 586 586 178

SOCIOPOLITICAL ORGANIZATION. **Political organization.** The basic unit of political organization is the village, which is composed of one or more dominant local descent groups plus several others. Village government is by an assembly of all resident adult males, under the informal chairmanship of a headman elected by them from among their number. The membership of any immigrant household into a village is defined by the participation of the household's males in this assembly. Sustained membership in a village is voluntary. Khasi chiefdoms probably arose out of voluntary associations of villages, which occasionally transferred allegiance from one chief to another.

Khasi AR7

211 rude stone monuments. At the village of Nougshai, near
[101] Shillong, are to be seen some very striking monoliths; and
[131] although they do not come up quite to the length of those at Nurtiang (noticed by Dr. Hooker in his "Himalayan Journals"), yet they are very worthy of being mentioned. They stand on
[132] the open spur just above the village, and have been worked out of the beds of the Shillong sandstone series, and some of the smaller blocks have been taken from the conglomerate beds, the lowest in the series, and which come in, in the bed of the ravine, to the north of the spur. There are a number of monuments on this site, large and small, arranged both in line and on two sides of a square; the two largest have their central monoliths—height, 24 ft. 3 in.; width, 5 ft. 6 in.; thickness, 8 in.; and height, 23 ft. 2 in.; width, 2 ft. 9 in.; thickness, 1 ft., respectively.

[126] Plate ii., which is taken from a photograph by Mr. William Robert, Assistant Surveyor in the Khasi Hills survey party, gives an excellent idea of the second largest structure, showing the very massive flat-stone, the "Mao Kynthai," in front. This structure consisted of thirteen upright stones, which could not all be brought into the field of the camera; but the six outside stones on the right are shown. Many of the slabs in the
175 adjacent monuments have been overthrown and broken quite
211 recently, perhaps by Sepoys and camp followers from the military station close by. At one time a mountain battery of Eurasian Artillery was quartered there, and I attribute the overthrow of so many of the stones in the neighbourhood to their handiwork, who would look on such amusement as a "great lark." The Sepoy (native of India) is not of a mischievous disposition; the European and half-European (uneducated) is markedly so. Thus the monument with the highest stone is imperfect, and it must, when perfect, have been a very handsome one. This is a sad pity, after the time and labour that must have been expended in its erection.

361 I did not observe any new slabs anywhere in the immediate
712 neighbourhood. Nougshai must formerly have been a large
[211] and powerful village; it stands on a naturally very strong position, and old lines of fortification are to be traced on many sides, especially on the approach from the direction of the Falls of the Umiam. These old lines of defence are on a curious system: a ditch and bank have been carried forward from the main defences from 200 to 300 yards down the ridge of the spurs, thus effectually preventing an enemy working round the hill sides below the villages.

174 This fortified site points to a state of things in these hills
712 when the relations between the large village communities or
628

 174 712 628

clans were very much as we find them at the present day among the Nagas and Kukis, beyond and bordering our present extreme limits, viz. that of constant feud. They are now the quietest, most peaceful, and contented of all the hill people on the eastern frontier. [178]

In my former paper I did not allude to the cairns in these hills, which I am inclined to think are works of greater age than the stone structures. The custom is one that certainly has long since been given up, for I could not obtain any satisfactory account of them. They are only to be seen on the northern side of the Khasi plateau, and Dr. Hooker, in his account of his trips to the Kollong Rock, did not fail to notice them. About Mairaug and towards Nougstoin they are very numerous, and always stand on commanding situations. On the path leading down the grassy spur to the stone monuments previously described, near Nougshai, is a very fine large example of a cairn, about eight feet high. They are usually plain hemispherical mounds of earth; but this one is faced all round at the base with slabs of stone about four feet high; they are frequently not higher than six feet. A distant view is shown in Plate iii. 172 [103]

Nowhere is there any trace of the earth that forms them having been excavated close by; it must, therefore, have been carried in some short distance, to avoid unsightly hollows near the structure. I should much like to have dug into one of these cairns, but was afraid to hurt the feelings of the people by doing so. They are very probably cineraries of an earlier form to those now made of stone, and this point it might be interesting to clear up.

Beyond the Khasi area no cairns are to be found, at least I had never come across any until visiting North Munipur last winter (1872—73), where, at the head of the Imphal river, on the direct road from Samaguting, are four fine cairns, all faced with large boulders. They are old, and the Nagas now living in the village near said they had been made by another clan of Nagas, who long ago had gone further north, and the site of whose village had been lately re-occupied by Kukis. [114] [101]

Mr. C. B. Clarke, in a paper read lately before your Institute, refers to the different forms of the cinerary in the Khasi Hills; but he has not quite exhausted the subject, or got further than I did, although with regard to the disposal of the ashes of the dead he gives some further interesting particulars. [114]

As I think that drawings are of very great interest, and better exhibit the many different forms of bone depository or cinerary that have been adopted at different periods by tribes inhabiting localities very far apart, and often quite unconnected affinitively, [126] [764]

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. 643 almost complete autonomy in the management of their
101 local affairs. In the remainder, called the Jaintia Hills, which became British in 1835, it has been the wise policy of the Government to maintain the indigenous system of administration through officers named *dolois*, who preside over large areas of country with very little interference. All the British portion of the hills is what is called a "Scheduled District" under Acts XIV and XV of 1874, and legislation which may be inappropriate to the conditions of the people can be, and is, excluded from operation within it. In these circumstances the administration is carried on in a manner well calculated to win the confidence and attachment of the people, who have to bear few of the burdens which press upon the population elsewhere, and, with the peace and protection guaranteed by British rule, are able to develop their institutions upon indigenous lines. It is now more than forty years since any military operations have been necessary within the hills, and the advance of the district in prosperity and civilization during the last half-century has been very striking.

177 The first contact between the British and the
648 inhabitants of the Khasi Hills followed upon the
● 175 acquisition by the East India Company, in consequence of the grant of the *Dīwānī* of Bengal in 1765, of the district of Sylhet. The Khasis were our neighbours on the north of that district, and to the north-east was the State of Jaintia,* ruled over by a chief of Khasi lineage, whose capital, Jaintiapur, was situated in the plain between the Surma river and the hills. Along this frontier the Khasis, though not averse from trade, and in possession of the quarries which furnished the chief

113 * The previous history of the Khasi State of Jaintia, so far as it can be traced, will be found related in Mr. E. A. Gait's *History of Assam* (1906), pp. 253-262.

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

supply of lime to deltaic Bengal, were also known as troublesome marauders, whose raids were a terror to the inhabitants of the plains. Captain R. B. Pemberton, in his Report on the Eastern Frontier (1835), mentions* an attack on Jaintia by a force under Major Henniker in 1774, supposed to have been made in retaliation for aggression by the Raja in Sylhet; and Robert Lindsay, who was Resident and Collector of Sylhet about 1778, has an interesting account of the hill tribes and the Raja of Jaintia in the lively narrative embodied in the "Lives of the Lindsays." † Lindsay, who made a large fortune by working the lime quarries and thus converting into cash the millions of cowries in which the land-revenue of Sylhet was paid, appears to have imagined that the Khasis, whom he calls "a tribe of independent Tartars," were in direct relations with China, and imported thence the silk cloths ‡ which they brought down for sale in the Sylhet markets. A line of forts was established along the foot of the hills to hold the mountaineers in check, and a Regulation, No. 1 of 1799, was passed declaring freedom of trade between them and Sylhet, but prohibiting the supply to them of arms and ammunition, and forbidding any one to pass the Company's frontier towards the hills with arms in his hands.

The outbreak of the first Burma War, in 1824, brought us into closer relations with the Raja of Jaintia, and in April of that year Mr. David Scott, the Governor-General's Agent on the frontier, marched through his territory from Sylhet to Assam, emerging at Raha on the Kalang river, in what is now the Nowgong district. This was the first occasion on which

* P. 211. † Vol. iii., p. 163, 177, &c.

‡ These cloths, which Lindsay calls "*moongadutties*," were really the produce of Assam, and were *dhutis* or waist-cloths of *muga* silk.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

177 Europeans had entered the hill territory of the Khasi
648 tribes, and the account of the march, quoted in
175 Pemberton's Report,* is the earliest authentic information which we possess of the institutions of the Khasi race. Dr. Buchanan-Hamilton, who spent several years at the beginning of the 19th Century in collecting information regarding the people of Eastern India, during which he lived for some time at Goalpara in the Brahmaputra Valley, confused the Khasis with the
[101] Garos, and his descriptions apply only to the latter people. The name Garo, however, is still used by the inhabitants of Kamrup in speaking of their Khasi neighbours to the South, and Hamilton only followed the local usage. In 1826 Mr. David Scott, after the expulsion of the Burmese from Assam and the occupation of that province by the Company, entered the Khasi Hills in order to negotiate for the construction of a road through the territory of the Khasi *Siem* or Chief of Nongkhlāw, which should unite Sylhet with Gauhati. A treaty was concluded with the chief, and the construction of the road began. At Cherrapunji Mr. Scott built for himself a house on the plateau which, two years later, was acquired from the Siem by exchange for land in the plains, as the site of a sanitarium.† Everything seemed to promise well, when the peace was suddenly broken by an attack made, in April 1829, by the people of Nongkhlāw on the survey party engaged in laying out the road, resulting in the massacre of two British officers and between fifty and sixty natives. This led to a general confederacy of

* Pp. 218-220. It appears from p. 219 that Mr. Scott's report is responsible for the erroneous statement (often repeated) that the mountaineers "called by us Cossyahs, denominate themselves Khyee." This second name is in fact the pronunciation current in Sylhet of the word *khāsi*, *h* being substituted for *s*, and should be written *Khāhi*.

† In Mr. Scott's time it was usual to speak of such a place as a "Sanatary."

most of the neighbouring chiefs to resist the British, and a long and harassing war, which was not brought to a close till 1833. Cherrapunji then became the head-quarters of the Sylhet Light Infantry, whose commandant was placed in political charge of the district, including the former dominions in the hills of the Raja of Jaintia, which he voluntarily relinquished in 1835 on the confiscation of his territory in the plains.

Cherrapunji, celebrated as the place which has the greatest measured rainfall on the globe, became a popular station, and the discovery of coal there, and at several other places in the hills, attracted to it many visitors, some of whom published accounts of the country and people. The first detailed description was apparently that of the Rev. W. Lish, a Baptist missionary, which appeared in a missionary journal in 1838. In 1840 Capt. Fisher, an officer of the Survey Department, published in the Journal of the Asiatic Society of Bengal * an account which showed that the leading characteristics of the Khasi race had already been apprehended; he mentions the prevalence of matriarchy or mother-kinship, notes the absence of polyandry, except in so far as its place was taken by facile divorce, describes the religion as a worship of gods of valleys and hills, draws attention to the system of augury used to ascertain the will of the gods, and gives an account of the remarkable megalithic monuments which everywhere stud the higher plateaus. He also recognizes the fact that the Khasis as a race are totally distinct from the neighbouring hill tribes. In 1841 Mr. W. Robinson, Inspector of Schools in Assam, included an account of the Khasis in a volume on that province which was printed at Calcutta. In 1844 Lieut.

* Vol. ix., pp. 833 sqq.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

114 Yule (afterwards Sir Henry Yule) published in the Journal of the Bengal Asiatic Society * a much more detailed description of the hills and their inhabitants than had been given by Fisher. This formed the basis of many subsequent descriptions, the best known of which is the attractive account contained in the second volume of Sir Joseph Hooker's *Himalayan Journals* † published in London in 1854. Sir Joseph visited Cherrapunji in June 1850, and stayed in the hills until the middle of the following November.

797 Meanwhile the Welsh Calvinistic Methodist Mission,
177 originally located at Sylhet, had extended their
175 operations to Cherrapunji, and in 1842 established a branch there. They applied themselves to the study of the Khasi language, for which, after a trial of the Bengali, they resolved to adopt the Roman character. Their system of expressing the sounds of Khasi has since that time continued in use, and after sixty years' prescription it would be difficult to make a change. Their Welsh nationality led them to use the vowel *y* for the obscure sound represented elsewhere in India by a short *a* (the *u* in the English *but*), and for the consonantal *y* to substitute the vowel *i*: *w* is also used as a vowel, but only in diphthongs (*āw*, *ew*, *iw*, *ow*); in other respects the system agrees fairly well with
114 the standard adopted elsewhere. Primers for the study of the language were printed at Calcutta in 1846 and 1852, and in 1855 appeared the excellent "Introduction to the Khasia language, comprising a grammar, selections for reading, and a Khasi-English vocabulary," of the Rev. W. Pryse. There now exists a somewhat extensive literature in Khasi, both religious and secular. An exhaustive grammar, by the Rev. H. Roberts, was

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

4. The Bhoi — occupy the northern slopes of the Khasi Hills, covered with thick semi-tropical forests; they practise jhum cultivation. 619

5. The Lynngam — inhabit the western border of the Khasi Hills, near the Garo Hills. They are said to be half-Khasi and half-Garo. Their economy is similar to that of the Bhoi.

These ecological and geographical differences correspond also to 175
politico-historical differences. From the 16th century to 1835, eve 648
of the annexation of the Jaintia Hills to the Khasi Hills under the British administration, the people of the Jaintia Hills formed part of the Hindu Jaintia kingdom, whose capital was Jaintiapur, on the border of the present East Pakistan and of the Jaintia Hills. The capital, at one time, was moved to Nortiang near Jowai in the heart of the Jaintia Hills. The Jaintia Hills were administrated by twelve governors. Such a highly developed economic system as based on wet rice cultivation, must have helped a great deal in forming a kingdom adjoining the plain. Through the common economy and political organization with the Hindus of the plain, the Hindu civilization of the Bengal plain penetrated deeply among the Jaintias, who are matrilineal hill dwellers.

On the other hand, the Khasi Hills have remained outside the histories of either Assam or Bengal. They were governed by a number of petty native chiefs: there were twenty-five chiefs ruling the Khasi Hills when the British colonial administration was established there. Most of these chiefs belonged to the Siem clan. The history of the Khasi Hills had been shrouded in darkness till the beginning of the 19th century, except for fragmentary stories such as Khasi raids on the Sylhet people.

The development of the upland Khasi Hills started with the estab- 178
lishment of its headquarters at Shillong in 1874. Since then the 648
features of the Khasi and Jaintia Hills have changed a great deal. 797
What was once a small Khasi hamlet, untouched by the light of history, has become nowadays a busy modern town where many Khasi intellectuals live, mixing with various outsiders who are engaged in official work or in business. The British administration opened the way to missionary activities, especially that of the Welsh Calvinist Methodists who set up a mission in the Hills in 1841, almost at the same time as British political influence began to make itself felt in the Khasi Hills. Along with the political penetration from Cherrapunjee [871]
(1833) to Shillong, missionaries established many institutions, includ- [743]
ing churches, schools and hospitals, etc. Christian education, bringing with it the promise of clerical positions, attracted young Khasi a great deal; and the majority of the upland Khasi have been converted to Christianity. They have become the modern intellectuals of their people.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

621 [Jatinga]

[175] This village was founded in 1905 by Khasi immigrants from the Jaintia Hills. At the entrance of the village, a bust of the founder, Lakhanbang Suchiang, [101] stands facing towards the east; it was erected on the occasion of the celebration [211] of their Golden jubilee, in November 1955. Houses are scattered along the [346] ridge of the moutain to the east and to the west; in the centre is the church. [771] All the inhabitants are Christians. Before the Partition this was one of the most modern and prosperous villages in Assam.

Jatinga provides a very interesting instance of the Khasi 'colonial' village. 101 It is surrounded by villages of the Kuki, of the Zemi-Naga, and of the Cacharee, 121 who constitute the main population of the North Cachar Hills, and who are tribes entirely different from the Khasi, in economy, social organization, language 621 and culture. Therefore, Jatinga is like an island of Khasi community. I took this village as one of my fields, because I was particularly interested to discover how far the Khasi matrilineal organization is kept up in a community thus situated, surrounded by patrilineal tribes, and considerably modernized by Christianization and economic prosperity; and I was also interested in the process of formation of a new village, in comparison with Rinsibara and Joshipara in the Garo Hills.

Formation of the Present Population of Jatinga.

The first immigrants to Jatinga.

101 The main population of Jatinga, including the founder, originated in Bataw 166 village in the Jaintia Hills, twelve miles away from Jaintiapur, the capital of the then Jaintia Rajas. This village is situated on the border of the Jaintia 175 Hills and the East Bengal plain, the location being very similar to that of Shella, as are their culture and economy. In the later part of the nineteenth 621 century, some members of Bataw village moved to Borkhala, ten miles from Silchar, one of the biggest villages of the then Cacharee king.

These immigrants who came to Borkhala stayed there about fifteen years before they came to Jatinga. Kloribon, the first daughter of the founder's sister was born there. In November 1905, some Christian Khasi left Borkhala for Jatinga, acting on information gathered from a Welsh Mission at Haflong, that the land of present Jatinga was fertile and fit for their cultivation. They were the first immigrants to Jatinga. The Government record names the 166 following three persons as the first immigrants to Jatinga: Suchiang Lakhanbang, 551 Tariang, and Suchen Munik. In fact, according to the data which I collected 614 at Jatinga, Suchiang Lakhanbang was accompanied by the following persons (the names in brackets indicate the clans):

621 his wife, Misibon (Phanwar),[1]
175 his brother, Pryntah, and Pryntah's wife, Sintu (Rupsi),
his sister, Laptho, and Laptho's husband, Munik (Suchen) with their daughter, Kloribon, and Munik's younger brother, Sain.
his friend, Tariang.

Soon after their settlement, Sain, the brother of Munik, brought his wife Tahin (Suiam) from Jaintia. Misibon brought her younger sister, Diasibon. Tariang who came with Lakhanbang afterwards called his wife, Palong. But having spent some time there, they left eventually for another place, so that

1. Misibon was a native of the Cherrapunjee area of the Khasi Hills (not of Jaintia like the others). She was a school teacher at Cherrapunjee, and later became a teacher at a school near Jaintiapur, where she married Lakhanbang.

15: Nakane E-5 (1955-1956) 1967 AR? Khasi AR?

there are none of their descendants in Jatinga. Summing up, the first party who settled at Jatinga was composed of people of the following five clans: 166

1. Suchiang — Lakhanbang, his sister, Lapthe, and her daughter, Kiwiboo, his brother, Pryntah. 551
2. Suchen — Munik and his younger brother, Sain. 614
3. Phanwar — Misibon and her younger sister, Diasibon. 621
4. Rupsi — Sintu, the wife of Pryntah. 175 •
5. Suiam — Tahin, the wife of Sain.

Among them, Suchen had no female member. Phanwar had no successor: Misibon had no issue and Diasibon did not marry. Therefore, Suchiang, Rupsi and Suiam are the oldest clans in present Jatinga. Suchiang and Rupsi especially are the dominant and richest groups among the present population.

This was the time when the railway from Gauhati to Silchar was being constructed. Some Khasi labourers were working at Haflong on the construction of the railway. After the foundation of Jatinga, these Khasi workers established marriage relations with the Khasi of Jatinga, and finally, upon completion of the railway, many of them became the inhabitants of Jatinga. The present members of the Dome and Siangshai clans are the descendants of these people, and they form a considerable number of the present inhabitants of Jatinga. Besides them, there were a few other Khasi at Haflong who were engaged in trading business. In the course of time, they also had marital relations with Jatinga people and came to Jatinga. 166 175 458 621 [499] [464]

After five years had elapsed they found that in spite of their hard work the land was not favourable to them. Many of them left Jatinga. This was the hardest period of Jatinga history.

The second migration (1919-1923).

The railway which once had been blocked was reopened in 1919. The people who had left Jatinga came back to settle there. This time the circumstances seemed to them quite favourable. The pan trees which they had planted earlier were growing and they could gather considerable produce. The village grew bigger around 1920 as a result of new immigrants from Jaintia; most of them were people from Butaw, the village of the founder. In this period, many immigrants came from Jaintia not only to Jatinga but also to Sylhet, Borkhola and other places outside the Khasi-Jaintia Hills. It seems that by this time the over-populated Jaintia realized that these areas were favourable for their new home. However, the successive waves of Jaintia immigrants to Jatinga ceased by 1923, its population having reached saturation point. [499] [245]

Orange production brought economic prosperity to the people of Jatinga. Wealthy villagers employed temporary labourers from the Jaintia Hills every year. Some of these labourers came with their families and others came individually. During their stay at Jatinga, some of them married and settled there. Hence, there are also descendants of such labourers among the present inhabitants of Jatinga. [245] [464]

Some Aspects of Descent Groups.

Throughout the history of Jatinga, immigrations have always been undertaken by a family (elementary family, siblings) or by an individual, but never by a group of clan members. Therefore, the present population is grouped in small descent groups according to each migration. Though some of them happened to have the same clan name, their history of migration and their 621 [175] [614] [166]

1903-28; 2, March 1962.) Demography. According to the 1951 census of India, the United Khasi-Jaintia Hills District contained 221,902 Khasis and 97,532 Syntengs, Pnars, and Jaintias (India [Republic] 1953-57). These figures, together with those for Khasis enumerated in Cachar (4,008), Mikir and North Cachar Hills (407), Lakhimpur (287), Sibsagar (279), and Darring (211) districts, and those for Syntengs enumerated in Mikir and North Cachar District (404), yield a total of 308,224 Khasis. History and cultural relations. Khasis believe that they had supernatural origin in Khasi Hills (see Gait 1906: 200 for historical evidence, and Bafy 1920: 5-9 for myth, but see also Costa 1956, 1960; Gordon 1907: 10-11, and Chatterji 1953: 12). Khasi tradition also states that in early times they moved gradually from east to west, from Jaintia toward Khasi Hills, in the practice of swidden agriculture (Gatphoh 1947: 97-98). The salient fact of known Khasi history, which begins generally in the mid-sixteenth century A.D. when there already existed the present-day 25 native Khasi chiefdoms, is the distinctive line of development followed by the separate kingdom of Jaintia. To the north, Jaintia was successively tributary, in part or in whole, to the Kachari kingdom (ca. 1250 A.D.); the Koch kingdom (strongest ca. 1500 A.D.), and the Ahom kingdom (strongest ca. 1700 A.D.) (Shakespear 1914: Map 1). To the south, about 1500 A.D., Jaintia extended its rule over a tract of Sylhet, which was populated by Hindus and Muslims, and saw its kings fall thereafter under Brahman influence. In the early 1800s, Jaintia became involved in the fratricidal strife then prevalent in the ruling family of Manipur. In 1830, after the Jaintia king ignored British warnings not to seize British subjects for human sacrifice, Jaintia was punished by the British annexation of the Jaintia pargana in Sylhet. The Jaintia king then voluntarily turned over to the British the hills area of his domain, so that the whole of Jaintia became part of British India and, in 1860, came to be taxed as such, although the Jaintias were otherwise allowed to maintain their traditional system of village government. • By contrast, the remaining Khasi states had few formal external relations until British times. Khasis resided and traded in both the Brahmaputra and Sylhet valleys, but were basically turned toward on their own hills, where warfare between villages and between the states was apparently common. Khasis came into indirect relation with the British in 1765, when Sylhet and its markets became part of British India. In the 1770s, cropped-up Khasi raids into Sylhet caused the British to throw up a defensive line of forts along the foothills. Later, it became necessary to place an embargo on Khasi products in the Sylhet markets. In 1827, the British penetrated into western Khasi Hills by negotiating with the Khasi chief of Nongkhlaw State to build a road through his territory, linking the recently annexed Brahmaputra valley with Calcutta. For three decades

thereafter, the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contracted that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, judging cases of heinous crimes, approving the popular selection of any new chief, and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life, and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Mills (n.d.): (1) The British introduced the potato, which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive specialization exhausted the soil and made for ever-poorer crops. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should inherit property that traditionally was earmarked for her performance of non-Christian religious rituals. (3) About 1864 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to marry with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the accelerated enrollments in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the Independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi-Jaintia Hills District became a Part B, or Autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The native-state system and the chiefs still exist, and the District Council finds it difficult to effect legislation which is neither offensive to regional customs nor a simple blueprint of ill-fitting all-India legislation. The major political schism at this time is between Jaintias, who are accustomed to centralized authority and taxation, and Khasis, who resist the notion of taxation to support the work of a central District Council. [Cf. Gait 1926; Aitchison 1931; Bhuyan 1949; Morris 1910.]

175 619 648 [726] [651] [177] 177 648 [249] [439] [134] [797] [428] [635] [633] [167] [563] [423] [973] 641 642 [651] [563] [113]

SETTLEMENT PATTERN AND HOUSING. Settlement pattern. Khasis live sedentarily in named, nucleated, and unplanned villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a de-

[P. 110B] AR7 Khasi AR7

another. In other words, a state is not a fixed territorial entity. In the early twentieth century, the most populous of the 25 chiefdoms, Khyrim, contained 36,833 persons occupying 7,859 houses in 372 villages, and the least populous, Nonghwai, contained 246 persons occupying 53 houses in 3 villages. Fifteen of the chiefdoms were headed by a *syiem* (chief), three by a *lyngdoh* (priest), six by a sirdar, and one by a *wahadadar*. These leaders all had executive and judicial functions, but a chief's authority was limited in that he had to obtain the approval of his executive council before acting. The other leaders were subject to a similar limitation. A chief maintained a small police force. His major sources of revenue were market tolls, fines, and, more recently, income from licenses to distill rice whisky. Succession to a ruling role in the larger states traditionally involved election by members of a lineage that had a hereditary right to elect, from among members of a lineage that had the hereditary right to rule. In British times, the elective basis was broadened, differentially in the various states, even to the point of popular elections. [Cf. Aitchison 1931; Lyngdoh 1952.] **Social stratification.** The three classes of lineage are the nobles, the commoners, and the slaves or servants. This stratification applies only to the recruitment to office in the native-state system, for there is no hypergamy, and in a village assembly everyone has equal voice. The noble lineages have the hereditary right to fill from among their male members roles such as village or state priest, councilor to a chief, or elector of a chief. The few lineages which today are remembered as slave or servant lineages had the inherited obligation to render special services to a chief's household. There is no Khasi term for "commoner." Every lineage other than a noble or a slave lineage is a commoner lineage, and the commoner lineages are in the majority. **Warfare.** Warfare was suppressed by the British, and little is known for certain about its traditional forms. The tactics which confronted the British were the ambush and the guerrilla raid. Traditional goals included taking heads from other Khasis and capturing women from the valleys.

RELIGION. **Major and indigenous religions.** A Welsh Calvinistic Methodist missionary penetrated into Cherrapunji in 1832, and the work that he began continues to this day. His society, which has since become the Welsh Presbyterian Foreign Mission, introduced writing, village primary schools, a high school, a theological seminary, and a hospital. Competing missionaries followed, and by 1914 some Shillong Khasis were puzzling over the tenets not only of traditional Hinduism and Islam but also of the Buddhists, Brahmo Samaj, Arya Samaj, and Unitarians (Roy 1914). By the 1920s, missionaries of the Church of God and the Seventh Day Adventists were

THE KHASI FESTIVAL OF 'POMBLANG'

S. BANERJEE

INTRODUCTION

The Khasi inhabit the upland of the central part of the United Khasi and Jaintia Hills district of Assam. They reckon descent through mother and the youngest daughter (Ka khadduh) of the house is the custodian of the ancestral property. Belief in the existence of spirits is strong among them and the causes of diseases are ascertained by taking recourse to the process of divination. They are ruled by different categories of Chief. The *Siem* is the highest official responsible for the administration of the state but a few small states are also governed by *Sirdars* with same powers as vested in the former although does not possess the same status. It is interesting to note that their priest whose rank is next to *Siem*, have also been allotted to perform this secular duties in some of the regions of the Khasi country. The Chief function through their respective council comprising elected members from different administrative units. He is rather subservient to this body as he is liable to be censured or even dismissed, if his activities are not in conformity with the Khasi traditional usage. Most of his directives are implemented through the assistance of his subordinates who are in-charge of various sections of the State. The Khasi place his grievance first to these junior officers for redress and justice, after which an appeal can be preferred to the *Siem* or any other higher officer as the case may be. One of the eminent States of the Khasi people known as Khyriem, where this festival is celebrated, consists of eight units for administrative convenience under the supervision of different grades of officials who participated in this celebration along with the *Siem* as representatives of the people.

The Khasi festival of *Pomblang* (Goat killing) described below used to be celebrated at one time in Shillong when the Khasi states of Khyriem and Mylliem were not separated. The first chief of the Khyriem state U Singh Manik shifted his headquarters to Nongkrem village after partition of the kingdom, which occured before the arrival of the British. He again moved to Lanekerdem after a brief stay at the village of Lyneshing. He performed this festival as long as he was there, transferring it again to Nongkrem where he re-settled again. It was celebrated here for a long time and consequently it was named after this village. Although the ruling family had later on shifted its residence about sixty years ago to the present village Smit, during the time of U Klur Singh, Siem, it is performed regularly as *Nongkrem dance* which was observed by the author from 21st June to 25th June, 1955.

OBJECT OF THE FESTIVAL

It is being held every year since the days of U Shillong who was supposed to be the founder of original Khyriem State. They celebrate it to perpetuate his memory and pay homage with a view to ensure rain, good harvest, eliminating diseases and famine. He was worshipped along with other ancestors with view to guide the present Chief in his discharge of his duties and for the welfare of the people.

The house of Siem (iing-sad) where the rites are observed, is considered sacred. It consists of a big-hall (shlur) in the centre, surrounded by rooms. One of these on the north is used as a kitchen room (iing-chetja) where ritual

18: Godwin-Austen G-3 (ca. 1872) 1875 AR7
Khasi AR7

21 rude stone monuments. At the village of Nougshai, near
[101] Shillong, are to be seen some very striking monoliths; and
[131] although they do not come up quite to the length of those at Nurtiang (noticed by Dr. Hooker in his "Himalayan Journals"), yet they are very worthy of being mentioned. They stand on
[133] the open spur just above the village, and have been worked out of the beds of the Shillong sandstone series, and some of the smaller blocks have been taken from the conglomerate beds, the lowest in the series, and which come in, in the bed of the ravine, to the north of the spur. There are a number of monuments on this site, large and small, arranged both in line and on two sides of a square; the two largest have their central monoliths—height, 24 ft. 3 in.; width, 5 ft. 6 in.; thickness, 8 in.; and height, 23 ft. 2 in.; width, 2 ft. 9 in.; thickness, 1 ft., respectively.

[126] Plate ii., which is taken from a photograph by Mr. William Robert, Assistant Surveyor in the Khasi Hills survey party, gives an excellent idea of the second largest structure, showing the very massive flat-stone, the "Mao Kynthai," in front. This structure consisted of thirteen upright stones, which could not all be brought into the field of the camera; but the six outside stones on the right are shown. Many of the slabs in the
175 adjacent monuments have been overthrown and broken quite
211 recently, perhaps by Sepoys and camp followers from the military station close by. At one time a mountain battery of Eurasian Artillery was quartered there, and I attribute the overthrow of so many of the stones in the neighbourhood to their handiwork, who would look on such amusement as a "great lark." The Sepoy (native of India) is not of a mischievous disposition; the European and half-European (uneducated) is markedly so. Thus the monument with the highest stone is imperfect, and it must, when perfect, have been a very handsome one. This is a sad pity, after the time and labour that must have been expended in its erection.

361 I did not observe any new slabs anywhere in the immediate
712 neighbourhood. Nougshai must formerly have been a large
[211] and powerful village; it stands on a naturally very strong position, and old lines of fortification are to be traced on many sides, especially on the approach from the direction of the Falls of the Umiam. These old lines of defence are on a curious system: a ditch and bank have been carried forward from the main defences from 200 to 300 yards down the ridge of the spurs, thus effectually preventing an enemy working round the hill sides below the villages.

174 This fortified site points to a state of things in these hills
712 when the relations between the large village communities or
628

homicide), in which their own subjects are concerned. All cases of homicide, or matters involving disputes between people belonging to different States, are adjudicated upon by the British officers of the District. 648 692

In the British possessions, the principal sources of revenue are rents and royalties derived from mineral workings, such as lime and coal; rents of fisheries; and a house tax, which varies, according to situation and productiveness of the soil, from R. 1 to Rs. 2 or from 2s. to 4s. per house. A land tax is only levied in tracts where the Government possesses the actual proprietary right in the soil. Again, in the Khási States, the British Government, which undertakes the management of the natural products of the country, such as waste lands, coal, lime, etc., receives a half-share of the rents realized from these sources, the other half belonging to the native Chiefs. The other sources of revenue of the Chiefs are market dues, cesses levied occasionally for State purposes, and fines realized in the administration of justice. 648 651 [135]

HISTORY.—Our first knowledge of the Khási Hills dates from the time when the East India Company acquired the *diwání* of Bengal in 1765. The adjoining District of Sylhet was included in that grant; but as the hillmen had never acknowledged any subjection to the Muhammadans, so they still remained absolutely independent of the British power. However, the necessities of commerce, arising from their monopoly of the lime quarries, from which Bengal has drawn its supply from time immemorial, soon attracted European enterprise to the country. As stated in the Appendix to the Statistical Account of Sylhet, the control of the profits of the lime trade formed in early times one of the most valuable advantages attaching to the position of the official in charge of that District. It does not appear that any European had been attracted to reside in the Hills before 1826. In that year the Rájá of Nongklao entered into an agreement with certain European British subjects to allow a road to be made across the Hills, to connect the Surmá valley with Assam Proper. These Europeans took up their residence at Nongklao. Misunderstandings unfortunately arose, and, partly by the misconduct of some of their Bengáli followers, the growing discontent and apprehension were fanned into a flame. On 4th April 1829 the Khásiás rose in arms and massacred Lieutenants Bedingfield and Burlton, together with some sepoys. This led to military operations on the part of the British Government, which 175 648 [135] [487]

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

175 continued through several cold seasons. The last of the Khásí chiefs
648 did not tender his submission until 1833. In February 1835 Colonel Lister was appointed Political Agent in the Khásí Hills, with his headquarters at Nongklao; and the command of the Sylhet Light Infantry battalion was also placed in his hands. The civil and military functions remained conjoined until 1854, when Mr. Hudson was deputed to Cherrá Púnjí, which had then become the administrative headquarters, with the title of Junior Assistant-Commissioner, shortly afterwards changed to the present one of Deputy-Commissioner.

The Jáintiá Hills came into British possession in 1835. In that year, as related in the Statistical Account of Sylhet District, the last Rájá of Jáintiá, Indra Singh, was deposed on the charge of complicity with certain of his tribesmen who had carried off three British subjects and barbarously immolated them at the shrine of Kálí. The portion of his territory that lay in the plains was forthwith annexed to the District of Sylhet; and the Rájá voluntarily resigned the hill portion, of which we also took possession. A pension of Rs. 500 a month, or £600 a year, was granted to the deposed Rájá for life, and he resided peaceably in Sylhet until
175 his death in 1861. When we first assumed the administration of
648 the Hills, no change was made in the indigenous revenue system,
651 which consisted simply of the payment of a he-goat once a year from each village. The Rájá had derived the greater portion of his income from his possessions in the plains. In 1860, however, a house tax was imposed, the highest limit of which was one rupee (2s.) per house. This measure of direct taxation was very obnoxious to the Syntengs. They formed irregular gatherings, at which they resolved to resist payment, or at least to refuse to pay except through their own hereditary Rájá, who was then alive. An outbreak took place in the early part of the year, but it was promptly suppressed; the people were disarmed, and matters went on much as usual. But the disarmament was imperfect, and it soon became evident that the Syntengs were profoundly disaffected to our rule. Towards the close of 1860 new taxation was introduced, in the form of judicial stamps; and the elaborate schedules of the new income tax were thrust into the hands of persons, few of whom could read the language in which they were framed. Imposts also were introduced upon fisheries and the right to cut timber. Con-
175 siderable feeling had been excited by a sanitary prohibition against
764
648

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

burning the dead in the immediate neighbourhood of the village of Jowái. Suspicions of insurrection arose during the months of October and November 1861. In the beginning of January 1862 alarming reports were received from various quarters, and the first serious outbreak occurred on the 17th of that month. This was occasioned by the interference of a *dárogá*, or native police official, with a religious ceremony that took place at the village of Jalong. In such ceremonies dancing with arms is held essential; and the *dárogá* took upon himself to disarm the dancers. This was the signal for a general rising. The *thánd* or police station at Jowái was burned to the ground; the garrison of sepoys was besieged, and all show of British authority was swept away throughout the Hills. The Syntengs fought bravely for their independence, and at first were successful in cutting off several small detachments of police and sepoys. Their weapons were bows and arrows. In common with the other hill tribes of the North-East Frontier, their chief defence consisted in a series of strong stockades, one behind another; and the paths leading to their villages were thickly planted with *pánjis*, or little bamboo spikes, stuck in the ground like caltrops. The battalion of sepoys stationed in the Hills was rendered inefficient by sickness. At last it was found necessary to move a regular army, including an elephant battery and two regiments of Sikhs, into the country in order to quell the revolt. Colonel Dunsford was in chief command. He was accompanied by Major Haughton, the Governor-General's Agent on the North-East Frontier, and Captain Morton, the Deputy-Commissioner of the Khásí and Jáintiá Hills, who acted in a political capacity. The operations were tedious and harassing. The rebel chiefs were captured one by one, and the District was declared to be finally pacified in March 1863, after the rebellion had lasted for fifteen months. The special Commission appointed under Act xi. of 1857, for the trial of offenders in the Jáintiá Hills, was dissolved in December 1863. The causes of the rebellion were thus summed up by Major Haughton in an official despatch to the Government of Bengal:—'Taxation was introduced without the supervision with which such a measure should have been accompanied. It was followed up by fresh taxation and rumours of other taxes, also by fiscal and other innovations, which tended to disturb the minds of the people, without any counterpoise such as might have resulted from the continued presence of a European officer.' The Syntengs, like the

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

175 Khásiás, have, ever since the measures of improvement which
648 followed, remained peaceable and contented.

General Aspect of the District.—The District consists
133 almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is steep, until a table-land is met with at an elevation of about 4000 feet. Higher up there is another plateau at Máo-flang, ten miles to the eastward of which, and in the same mountain range, the Civil Station of Shillong is situated at an elevation of 4900 feet above sea level. On the northern side of the hills are two plateaux, one between 1000 and 2000 feet below the level of Shillong, and the second lower down, about 3000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken
137 here and there by the valleys of the larger hill streams. In the higher ranges, where the hills have been denuded of forest, the country is covered with short grass, which becomes longer and more rank in the lower elevations. A remarkable feature in the
[778] aspect of the country throughout the hills is the numerous sacred groves which superstition has preserved from time immemorial from the destructive hand of the woodcutter. These sacred groves contain beautiful timber-trees of various kinds, rare orchids, rhododendrons, and wild cinnamon. On the more elevated table-lands, pine trees and stunted oak are met with; and in the lower hills, in every direction, are dense forests of the usual Indian trees, containing valuable timber.

134 The geological formation is mainly granitic, with stratified rocks
135 of sandstone, limestone, and shale. The coal-beds rest on trap and metamorphic rocks. The prevailing surface soil is a red ferruginous loam.

133 Mountains.—The principal mountain ranges and highest peaks in the Khási and Jáintiá Hills are as follow:—(1) The Shillong range—height of principal peak, 6449 feet above sea level. (2) Dingiei range—principal peak, 6400 feet. (3) Máo-thad-rái-shán range—highest peak, 6297 feet. (4) Láo-syn-niá range—highest peak, 5775 feet. (5) Láit-máo-doh range—highest peak, 5377 feet. (6) Láo-ber-sát—highest peak, 5400 feet. (7) Láo-bah range—highest peak, 4464 feet. (8) Lyng-ker-dem range—highest peak, 5000 feet. (9) Lúm-baiong range—highest peak, 4646 feet. (10) Máo-syn-rám range—highest peak, 5810 feet.

The principal mountains are:—(1) Rap-leng—height, 5671 feet.

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

105 It will here be recalled that the Khasi are a matrilineal agricultural
[175] people, pre-litterate until the advent of the British in the sixth decade of
[197] the 19th century, organized under democratically ruling *siem*, or Khasi
144 princes and chieftains and speaking an Austro-Asiatic language [14]. Their physical affinities are unmistakably mongoloid and quite distinct from the Assamese speaking plains-Indians, — but not from the other mountaineers of Assam, Nepal and even Burmah or China, with whom they feel to be more closely related, as with the Indian plainspeople, as some of the tribal designations in the following lists of terms for Non-Khasi testifies (comp. No. 41 as against No. 42, 43 and 43/*a-e*).

114 In the collection of the material, I was hampered by my inability to
122 pick up the Khasi language sufficiently quickly, for conversation without the help of an interpreter, but on the other hand greatly eased by generous and voluntary assistance on the part of several Khasi friends, especially U Ekiman Singh, the President, Unitarian Union, Khasi- and Jaintai Hills and his (Khasi) wife, Ka Austria [15], who offered me hospitality in their house at Maw Syn Jri, during my stay there. Dr. H. LYNGDOH, Shillong, the author of detailed accounts on Khasi religious ceremonial and institutions [16], U Jeeban Roy, a leading Pnár gentleman of Jowei in the Jaintia Hills, Ka Ellen Giri, Principal, Govt. Basic Education Training Centre, Malki, Shillong, Ka Kongmen, Shillong, and U David Roy, Prime Minister (retd.), and a number of hospitable Wár Khasi and Wár-Jaintia pan-leaf cultivators in the southern slopes of the Khasi- and Jaintia Hills, especially from the villages Mawlat and Padu, also helped me greatly in my task. My thanks are due to all of them.

101 The data, submitted and briefly described in this paper were thus
114 collected in four different areas.

1. The South-eastern corner of the Khasi-Hills (plateau-area),
2. the southern slopes of the Khasi Hills, the "Wár-Khasi country" between the Khasi plateau proper and the northern boundary of East Pakistan,
3. the central plateau of the Jaintia Hills, round its capital market Jowei, and
4. the southern slopes of the Jaintia Hills, the "Wár-Jaintia country" between these and a section of the northern boundary of East Pakistan, further to the East than area 2.

197 Slightly different Khasi dialects are spoken in these four regions, Jaintia (Pnár or "Synteng") and Wár-Jaintia being more akin to each other, similarly as Plateau-Khasi and Wár-Khasi are.

101 The Pnár or Jaintias ("Synteng" is a slightly opprobious designation,
175 used by the Plateau-Khasi for these, their eastern neighbours) look back

[14] SCHMIDT (1906).

[553] [15] So named, because Austria was much in the news at the time of her birth, during the first world war: — a fact which illustrates the Khasi peculiarity to use either ad hoc inventions as names for children, or to adopt such, from the Khasi point of view, outlandish words like: "Ka Austria" or "Ka Mediterranean Sea" as names for their children.

[16] LYNGDOH (1937).

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

643 almost complete autonomy in the management of their
101 local affairs. In the remainder, called the Jaintia Hills, which became British in 1835, it has been the wise policy of the Government to maintain the indigenous system of administration through officers named *dolois*, who preside over large areas of country with very little interference. All the British portion of the hills is what is called a "Scheduled District" under Acts XIV and XV of 1874, and legislation which may be inappropriate to the conditions of the people can be, and is, excluded from operation within it. In these circumstances the administration is carried on in a manner well calculated to win the confidence and attachment of the people, who have to bear few of the burdens which press upon the population elsewhere, and, with the peace and protection guaranteed by British rule, are able to develop their institutions upon indigenous lines. It is now more than forty years since any military operations have been necessary within the hills, and the advance of the district in prosperity and civilization during the last half-century has been very striking.

177 The first contact between the British and the
648 inhabitants of the Khasi Hills followed upon the
175 acquisition by the East India Company, in consequence of the grant of the *Dīwānī* of Bengal in 1765, of the district of Sylhet. The Khasis were our neighbours on the north of that district, and to the north-east was the State of Jaintia,* ruled over by a chief of Khasi lineage, whose capital, Jaintiapur, was situated in the plain between the Surma river and the hills. Along this frontier the Khasis, though not averse from trade, and in possession of the quarries which furnished the chief

113 * The previous history of the Khasi State of Jaintia, so far as it can be traced, will be found related in Mr. E. A. Gait's *History of Assam* (1906), pp. 253-262.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

supply of lime to deltaic Bengal, were also known as troublesome marauders, whose raids were a terror to the inhabitants of the plains. Captain R. B. Pemberton, in his Report on the Eastern Frontier (1835), mentions* an attack on Jaintia by a force under Major Henniker in 1774, supposed to have been made in retaliation for aggression by the Raja in Sylhet; and Robert Lindsay, who was Resident and Collector of Sylhet about 1778, has an interesting account of the hill tribes and the Raja of Jaintia in the lively narrative embodied in the "Lives of the Lindsays." † Lindsay, who made a large fortune by working the lime quarries and thus converting into cash the millions of cowries in which the land-revenue of Sylhet was paid, appears to have imagined that the Khasis, whom he calls "a tribe of independent Tartars," were in direct relations with China, and imported thence the silk cloths ‡ which they brought down for sale in the Sylhet markets. A line of forts was established along the foot of the hills to hold the mountaineers in check, and a Regulation, No. 1 of 1799, was passed declaring freedom of trade between them and Sylhet, but prohibiting the supply to them of arms and ammunition, and forbidding any one to pass the Company's frontier towards the hills with arms in his hands.

The outbreak of the first Burma War, in 1824, brought us into closer relations with the Raja of Jaintia, and in April of that year Mr. David Scott, the Governor-General's Agent on the frontier, marched through his territory from Sylhet to Assam, emerging at Raha on the Kalang river, in what is now the Nowgong district. This was the first occasion on which

* P. 211. † Vol. iii., p. 163, 177, &c.

‡ These cloths, which Lindsay calls "*moongadutties*," were really the produce of Assam, and were *dhutis* or waist-cloths of *muga* silk.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

177 Europeans had entered the hill territory of the Khasi
648 tribes, and the account of the march, quoted in
175 Pemberton's Report,* is the earliest authentic information which we possess of the institutions of the Khasi race. Dr. Buchanan-Hamilton, who spent several years at the beginning of the 19th Century in collecting information regarding the people of Eastern India, during which he lived for some time at Goalpara in the Brahmaputra Valley, confused the Khasis with the
[101] Garos, and his descriptions apply only to the latter people. The name Garo, however, is still used by the inhabitants of Kamrup in speaking of their Khasi neighbours to the South, and Hamilton only followed the local usage. In 1826 Mr. David Scott, after the expulsion of the Burmese from Assam and the occupation of that province by the Company, entered the Khasi Hills in order to negotiate for the construction of a road through the territory of the Khasi *Siem* or Chief of Nongkhlāw, which should unite Sylhet with Gauhati. A treaty was concluded with the chief, and the construction of the road began. At Cherrapunji Mr. Scott built for himself a house on the plateau which, two years later, was acquired from the Siem by exchange for land in the plains, as the site of a sanitarium.† Everything seemed to promise well, when the peace was suddenly broken by an attack made, in April 1829, by the people of Nongkhlāw on the survey party engaged in laying out the road, resulting in the massacre of two British officers and between fifty and sixty natives. This led to a general confederacy of

* Pp. 218-220. It appears from p. 219 that Mr. Scott's report is responsible for the erroneous statement (often repeated) that the mountaineers "called by us Cossyahs, denominate themselves Khyee." The second name is in fact the pronunciation current in Sylhet of the word *khāsi*, *h* being substituted for *s*, and should be written *Khāhi*.

† In Mr. Scott's time it was usual to speak of such a place as a "Sanatary."

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

most of the neighbouring chiefs to resist the British, and a long and harassing war, which was not brought to a close till 1833. Cherrapunji then became the head-quarters of the Sylhet Light Infantry, whose commandant was placed in political charge of the district, including the former dominions in the hills of the Raja of Jaintia, which he voluntarily relinquished in 1835 on the confiscation of his territory in the plains.

Cherrapunji, celebrated as the place which has the greatest measured rainfall on the globe, became a popular station, and the discovery of coal there, and at several other places in the hills, attracted to it many visitors, some of whom published accounts of the country and people. The first detailed description was apparently that of the Rev. W. Lish, a Baptist missionary, which appeared in a missionary journal in 1838. In 1840 Capt. Fisher, an officer of the Survey Department, published in the Journal of the Asiatic Society of Bengal * an account which showed that the leading characteristics of the Khasi race had already been apprehended; he mentions the prevalence of matriarchy or mother-kinship, notes the absence of polyandry, except in so far as its place was taken by facile divorce, describes the religion as a worship of gods of valleys and hills, draws attention to the system of augury used to ascertain the will of the gods, and gives an account of the remarkable megalithic monuments which everywhere stud the higher plateaus. He also recognizes the fact that the Khasis as a race are totally distinct from the neighbouring hill tribes. In 1841 Mr. W. Robinson, Inspector of Schools in Assam, included an account of the Khasis in a volume on that province which was printed at Calcutta. In 1844 Lieut.

* Vol. ix., pp. 833 sqq.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

114 Yule (afterwards Sir Henry Yule) published in the Journal of the Bengal Asiatic Society * a much more detailed description of the hills and their inhabitants than had been given by Fisher. This formed the basis of many subsequent descriptions, the best known of which is the attractive account contained in the second volume of Sir Joseph Hooker's *Himalayan Journals* † published in London in 1854. Sir Joseph visited Cherrapunji in June 1850, and stayed in the hills until the middle of the following November.

797 Meanwhile the Welsh Calvinistic Methodist Mission, 177 originally located at Sylhet, had extended their 175 operations to Cherrapunji, and in 1842 established a branch there. They applied themselves to the study of the Khasi language, for which, after a trial of the Bengali, they resolved to adopt the Roman character. Their system of expressing the sounds of Khasi has since that time continued in use, and after sixty years' prescription it would be difficult to make a change. Their Welsh nationality led them to use the vowel *y* for the obscure sound represented elsewhere in India by a short *a* (the *u* in the English *but*), and for the consonantal *y* to substitute the vowel *i*: *w* is also used as a vowel, but only in diphthongs (*āw*, *ew*, *iw*, *ow*); in other respects the system agrees fairly well with 114 the standard adopted elsewhere. Primers for the study of the language were printed at Calcutta in 1846 and 1852, and in 1855 appeared the excellent "Introduction to the Khasia language, comprising a grammar, selections for reading, and a Khasi-English vocabulary," of the Rev. W. Pryse. There now exists a somewhat extensive literature in Khasi, both religious and secular. An exhaustive grammar, by the Rev. H. Roberts, was

* Vol. xiii, pp. 612 seq.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

or Mynnār, spoken in the extreme north, and there may be others. A great desideratum for linguistic purposes is a more adequate method of recording sounds, and especially differences of tone, than that adopted for the standard speech, which though sufficient for practical purposes, does not accurately represent either the quantity or the quality of the vowels, and leaves something to be desired as regards the consonants (especially those only faintly sounded or suppressed). These things, no doubt, will come in time. The immense advance which has been made in education by the Khasis during the last half-century has enabled some among them to appreciate the interesting field for exploration and study which their own country and people afford; and there is reason to hope that with European guidance the work of record will progress by the agency of indigenous students.

It remains to summarize briefly the principal distinctive features of this vigorous and sturdy race, who have preserved their independence and their ancestral institutions through many centuries in the face of the attractions offered by the alien forms of culture around them.

In the first place, their social organization presents one of the most perfect examples still surviving of matriarchal institutions, carried out with a logic and thoroughness which, to those accustomed to regard the status and authority of the father as the foundation of society, are exceedingly remarkable. Not only is the mother the head and source, and only bond of union, of the family: in the most primitive part of the hills, the Synteng country, she is the only owner of real property, and through her alone is inheritance transmitted. The father has no kinship with his children, who belong to their mother's clan; what he earns goes

1:Gurdon E-4,5 (no date) 1907 AR7 Khasi AR7

577 plains, jealous of their power, brave in action, and have an aversion to falsehood."

797 Khasis of the interior who have adopted Christianity are generally cleaner in their persons than the non-Christians, 177 and their women dress better than the latter and have an air 515 of self-respect about them. The houses in a Christian village 342 are also far superior, especially where there are resident European missionaries. Khasis who have become Christians often 771 take to religion with much earnestness (witness the recent 797 religious revival in these hills, which is estimated by the Welsh missionaries to have added between 4,000 and 5,000 converts to 794 Christianity), and are model Sabbatarians, it being a pleasing sight to see men, women, and children trooping to church on a Sunday dressed in their best, and with quite the Sunday expression on their faces one sees in England. It is a pleasure to hear the sound of the distant church bell on the hill-side on a Sunday evening, soon to be succeeded by the beautiful Welsh hymn tunes which, when wafted across the valleys, carry one's thoughts far away. The Welsh missionaries have done, and continue to do, an immense amount of good amongst these people. It would be an evil day for the Khasis if anything should occur to arrest the progress of the mission work in the Khasi Hills.

GEOGRAPHICAL DISTRIBUTION.

162 The Khasis inhabit the Khasi and Jaintia Hills, although 101 there are a few Khasi settlers in the neighbouring plains districts. The Census Report of 1901 gives the following figures of Khasi residents in the plains:—

Cachar	333
Sylhet	3,083
Goalpara	4
Kamrup	191
Darrang	10
Nowgong	29
Sibsagar	62
Lakhimpur	22
Lushai Hills..	77
North Cachar	22
Naga Hills	62

1:Curzon E 4, 5 (no date) 1907 AR7 Khasi AR7

171 Southern Moluccas the placenta is mixed with ashes, placed in
144 a pot, and hung on a tree; a similar custom is observed in Mandeling, on the west coast of Sumatra. This is a custom universally observed amongst the Khasis at births. Teknonomy to some extent prevails amongst some of these Malay tribes as with the Khasis. It will be seen from the above notes that there are some interesting points of affinity between the Khasis and some of the Malay tribes, and if we add that the Khasis are decidedly Malay in appearance, we cannot but wonder whether the Malays have any connection not only with the Mon-Khmér family, but also with the Khasis, with the Ho-Mundas, and with the Naga tribes mentioned by Mr. Peal in his interesting paper published in the Journal of the Asiatic Society of Bengal, already referred to. We will study the strong linguistic affinities between these peoples in the section which deals with language.

M. Aymonier in "Le Cambodge" mentions the matriarchate as having been prevalent apparently amongst the primitive races of Cambodia, and notes that the ancient Chinese writers spoke of Queens in Fou-nan (Cambodia). If the Khmérs were the ancient people of Cambodia, here we have an important landmark in common between them and the Khasis. M. Aymonier goes on to speak of priestesses, and the Cambodian taboo, *tam* or *tenam*, which Mr. Lowis, the Superintendent of Ethnography in Burma, suggests may be akin to the Khasi *sang*.

DRESS.

291 Dress may be divided into two divisions, ancient and modern. It will be convenient to take the former division first. The Khasi males of the interior wear the sleeveless coat or *jymphong*, which is a garment leaving the neck and arms bare, with a fringe at the bottom, and with a row of tassels across
[177] the chest; it is fastened by frogs in front. This coat, however, may be said to be going out of fashion in the Khasi Hills, its place being taken by coats of European pattern in the more civilized centres and by all sorts of nondescript garments in the interior. The sleeveless coat, however, is still worn by many

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

[499] this manner, the males earning on an average 8 annas and the
463 females 6 annas a day. Col. Bivar writes that in 1875 the
465 wages for ordinary male labourers were 4 to 8 annas a day, and for females 2½ to 4 annas, so that the wages rates have almost doubled in the last thirty years. Contractors, however, often manage to obtain daily labour at lower rates than those paid by Government. Stonemasons and skilled labourers are able to
482 get higher rates. It is easier to obtain coolies in the Khasi
241 than in the Jaintia Hills, where a large proportion of the popu-
461 lation is employed in cultivation. The Khasis are excellent labourers, and cheerful and willing, but they at once resent bad treatment, and are then intractable and hard to manage. Khasis are averse to working in the plains in the hot-weather months.

APICULTURE.

231 I am indebted to Mr. Rita for the following remarks on apiculture in the Khasi and Jaintia Hills.

There are two kinds of indigenous bees in the Khasi Hills, one domesticated, called *u opap (apis Indica)*, and the other *u lymai*, which is never domesticated, and is very pugnacious; its hives are difficult of access, being always located in very high cliffs. A few hives of a third class of bee are now-a-days to be found in and around the station of Shillong, i.e. the Italian.
77] This bee was imported into the hills by Messrs. Dobbie and Rita, and the species became propagated in the following manner. The bees had been just established in a hive, where they had constructed a brood comb, when the hive was robbed by some Khasis for the sake of the *larvæ* it contained, which they wished to consume as food; but the queen bee escaped and established other colonies, one of which was afterwards captured by Mr. Rita, the others establishing themselves at places in the neighbourhood. The hive used by the Khasis is of a very primitive description. It is usually a hollow piece of wood, about 2½ to 3 ft. in length and 10 or 12 in. in diameter. A small door is placed at each end of the log, one for the bees to go in and out, and the other for the removal of the honey when wanted. The honey-combs are broken and the honey is

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

392 Syntengs plaster the space in front of the house with red earth and cow-dung, this custom being probably a remnant of Hindu influence. The Khasis have some peculiar customs when they build a new house. When the house is completed they perform a ceremony, *kyojok-iko-shain*, when they tie three pieces of dried fish to the ridge pole of the house and then jump up and try to pull them down again. Or they kill a pig, cut a piece of the flesh with the skin attached, and fix it to the ridge pole, and then endeavour to dislodge it. The Syntengs at Nartiang worship *U Biskurem* (Biswakarma) and *Ka Siem Syngkar* when a house is completed, two fowls being sacrificed, one to the former, the other to the latter. The feathers of the fowls are affixed to the centre post of the house, which must be of *u diang ewing*, a variety of the Khasi oak. The worship of a Hindu god (Biswakarma), the 77% architect of the Hindu gods, alongside the Khasi deity *Ka Siem* 177 *Syngkar*, is interesting, and may be explained by the fact that 392 Nartiang was at one time the summer capital of the kings of Jaintia, who were Hindus latterly and disseminated Hindu customs largely amongst the Syntengs. Mr. Bita says that 637 amongst the Syntengs, a house, the walls of which have been 392 plastered with mud, is a sign that the householder has an enemy. The plastering no doubt is executed as a preventive of fire, arson in these hills being a common form of revenge.

392 Amongst the Khasis, when a daughter leaves her mother's house and builds a house in the mother's compound, it is considered *ewing*, or taboo, for the daughter's house to be built on the right-hand side of the mother's house, it should be built either on the left hand or at the back of the mother's house.

77% In Nongtrai it is customary to worship a deity called 793 *u Ki Sep* (Khasi, *u phaw*), by nailing up branches of the Khasi oak, interspersed with jaw-bones of cattle and the feathers of fowls, to the principal post, which must be of *u diang ewing*. The Siem priestess of the Nongkrem State at Smit and the ladies of the Siem family perform a ceremonial dance before a large post of oak in the midst of the Siem priestesses' house on the occasion of the annual goat-killing ceremony. This oak post is furnished according to custom by the *kyngkar*

l:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

776 or official spokesman of the Siem's Durbar. Another post of
793 oak in this house is furnished by the people of the State.

342 The houses of the well-to-do Khasis of the present day in
177 Mawkhar and Cherrapunji are built after the modern style
353 with iron roofs, chimneys, glass windows and doors. In Jowai the well-to-do traders have excellent houses of the European pattern, which are as comfortable as many of the European subordinates' quarters in Shillong. Some up-to-date families in Shillong and at Cherra allow themselves muslin curtains and European furniture.

342 The houses of the Pnar-Wárs are peculiar. The roof, which
[324] is thatched with the leaves of a palm called *u tynriew*, is hog-backed and the eaves come down almost to the ground. There are three rooms in the Wár as in the Khasi house, although called by different names in the Wár dialect. The hearth is in the centre room. The houses are built flush with the ground [361] and are made of bamboos. In the Wár villages of Nongjri and 396 Umniuh there are small houses erected in the compounds of 782 the ordinary dwelling-houses called *ieng kruid* (spirit houses). In these houses offerings to the spirits of departed family ancestors are placed at intervals, this practice being very similar to the more ancient form of Shintoism. In some Wár villages 342 there are also separate bachelors' quarters. This custom is in accordance with that of the Naga tribes. There is no such custom amongst the Khasi Uplanders. The Wár houses are similar to those of the Pnar Wárs, except that a portion of the house is generally built on a platform, the main house resting on the hill-side and the portion on the platform projecting therefrom, the object being to obtain more space, the area for houses in the village sites being often limited owing to the steepness of the hill-sides.

The Bhoi and Lyngam houses are practically similar, and may be described together. They are generally built on fairly high platforms of bamboo, are frequently 30 to 40 ft. in length, and are divided into various compartments in order [354] to suit the needs of the family. The hearth, which is of earth, is in the centre room. There is a platform at the back of the Lyngam house, and in front of the Bhoi house, used for drying paddy, spreading chillies, &c., and for sitting on when the day's

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

(*ki thiar*). The paddy-fields are not manured. The Khasis, 243
when cultivating high lands, select a clayey soil if they can. In the early part of the winter the sods are turned over with the hoe, and they are exposed to the action of the atmosphere for a period of about two months. When the sods are dry, they are placed in piles, which are generally in rows in the fields, and by means of ignited bunches of dry grass within the piles a slow fire is kept up, the piles of sods being gradually reduced to ashes. This is the "paring and burning process" used in England. The ashes so obtained are then carefully raked over the field. Sometimes other manure is also applied, but not when paddy is cultivated. The soil is now fit to receive the seed, either high-land paddy, millet, Job's tears, or other crops, as the case may be. The homestead lands are plentifully manured, and consequently, with attention, produce good crops. They are cultivated with the hoe.

The cultivation of oranges in the southern portion of the 244
district ranks equally in importance with that of the potato in 245
the northern. The orange, which is known in Calcutta as the Chhatak or Sylhet orange, comes from the warm southern slopes of the hills in this district, where it is cultivated on an extensive scale. Although oranges do best when there is considerable heat, they have been known to do well as high as 3,000 ft.; but the usual limit of elevation for the growth of oranges in this district is probably about 1,000 to 1,500 ft. The orange of the Khasi Hills has always been famous for its excellence, and Sir George Birdwood, in his introduction to the "First Letter Book of the East India Company," page 36, refers to the orange and lemon of Garhwál, Sikkim, and Khasia as having been carried by Arab traders into Syria, "whence the Crusaders helped to gradually propagate them throughout Southern Europe." Therefore, whereas the potato was im- [77]
ported, the orange would appear to be indigenous in these hills.

Nurseries.—The seeds are collected and dried by being 247
exposed to the sun. In the spring nurseries are prepared, the ground being thoroughly hoed and the soil pulverized as far as possible. The nursery is walled with stones. The seeds are then sown, a thin top layer of earth being applied. The

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

526 certain incantations freely referring to the many faults of the opposite side, and pours water at intervals from the bamboo in front of the target. This business lasts about two hours. Then they exhort the competitors of their respective sides, and the match commences amidst loud shouts. Every time there is a hit there are loud cheers, the competitors leaping high into the air, the umpires muttering their incantations all the while. At the end of each turn the number of hits are counted by representatives of both sides. At the close of the day the side with the greatest number of hits wins the match, the successful party returning home, dancing and shouting. The young women admirers of both sides assemble, and dispense refreshments to the competitors, taking a keen interest in the proceedings withal. Frequently large wagers
525 are made on either side. In the *Khadar Blang* portion of the
526 Nongkrem State as much as Rs. 500 are occasionally wagered on either side. In Jowai the practice is also to bet a lump sum, the amount being raised by subscription from amongst the competitors. More usual bets are, however, about one anna a head. The *nong khang khnam* and the men who prepare the targets receive presents from their respective sides. The Khasi bow carries a considerable distance, an arrow shot over 180 yards being within the personal knowledge of the writer. It is believed that Khasi bows wielded by experts carry up to 200 yards. The average range may be said, however, to be 150 to 180 yards.

524 Yule mentions peg-top spinning amongst Khasi children as
177 being indigenous and not an importation, but Bivar thinks that the game is of foreign introduction. I am, however, inclined to agree with Yule that peg-top spinning is indigenous, inasmuch as this game could not have been copied from the Sylhetis or the Assamese of the plains, who do not indulge in it. As the British had only recently established themselves in the hills when Yule wrote, they would scarcely have had time or opportunity to introduce an English children's game. Khasi
524 children also play a kind of "hop Scotch" (*khyndat mala shito* and *in tiet hile*), and Yule writes, "Another of their recreations is an old acquaintance also, which we are surprised to meet with in the Far East. A very tall, thick bamboo is planted in

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

The
597 adoption of a female obviates the family dying out (*iap duh*),
428 which to the Khasi is a very serious matter, inasmuch as there
764 will then be no one qualified to place the bones of its members within the family tomb (*ka ba thep shieng mawbah*), and to
597 perform the requisite funeral ceremonies. Amongst the Khasis no particular ceremonies are performed at the time of
262 adoption; but some of the Syntengs observe a religious cere-
782 mony which consists largely of a feast to the clans-folk, at which liquor, rice, dried fish, and ginger are partaken of. Before the feast commences, each clansman is provided with a small gourd (*u klong*) filled with liquor, a little of the latter is then thrown on the ground from the gourd, and the following words are uttered:—

"Oh, God! oh, Lord! oh, ruling king Biskurom, now the *pynrap iing* ceremony is about to be performed, let the ceremony be propitious, and let males and females (of the clan) increase in numbers, so that the clan may become great, and respected, and that intelligent male members may spring up." No such ceremony is, however, observed, it is understood, in the Nartiang and Raliang doloiships.

597 In the case of a family being *iap duh* (extinct), the family
428 property, according to Khasi custom, passes to the Siem. Therefore it is to the interest of the members of families to
421 adopt a female, when such necessity arises. As there is no religious ceremony which is compulsory to the Khasis on the occasion of an adoption, perhaps we are almost justified in concluding that in former times the adoption custom did not exist, more especially as the Khasis possess a special word, *iap duh*, for describing a family the females of which have all died out; and it is admittedly the custom for the Siem to succeed to the
177 property of such a family. The Synteng custom of *'rap iing*
797 may have been borrowed from the Hindus, when the Rajas of Jaintia became converts to that religion.

TENURE OF LAND AND LAWS REGARDING LAND.

423 Land in the Khasi Hills proper, i.e. land in the high plateau, is held somewhat differently from land in the Jaintia Hills and

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Mr. Jenkins, in his interesting little work on "Life and
753 Work in Khasia," gives a slightly different account of the
776 superstition, in that he states that it is the sick person who
826 is possessed by *ka Taroh*. The above belief is perhaps a
164 Synteng development of the Khasi *thlen* superstition. In
177 the Jaintia Hills "the small-pox" is believed to be a goddess, and is reverenced accordingly. Syntengs regard it as an honour to have had small-pox, calling the marks left by the disease the "kiss of the goddess"; the more violent the attack and the deeper the marks, the more highly honoured is the person affected. Mr. Jenkins says, "When the goddess has entered a house, and smitten any person or persons with this disease, a trough of clean water is placed outside the door, in order that every one before entering may wash their feet therein, the house being considered sacred." Mr. Rita mentions cases of women washing their hair in water used by a small-pox patient, in order that they may contract the disease, and women have been known actually to bring their little children into the house of a small-pox patient, in order that they may become infected and thus receive the kiss of the goddess. It is possible that the Syntengs, who were for some time under Hindu influences, may in their ignorance have adopted this degraded form of worship of the Hindu goddess, "Sitala Devi," who is adored as a divine mother under different names by Hindus all over India: cf., her name *mari-amman*, or mother of death, in the South of India, and the name Ãi, mother, of the Assamese.

In the Khasi Hills the god of small-pox is known under the name of *u Siem ñiang thylliew*. He is not, however, appeased in any way, the people calling on two other spirits, *Thynrei* and *Sapa*, to whom a fowl or a goat is offered.

776 This section cannot be closed without some reference to the
773 household gods of the Syntengs. The legend is that in ancient times there came a woman "from the end of heaven to the borders of the country of *u Truh*" (the country of the plains people at a distance from the foot of the Khasi and Jaintia Hills). The name of the woman was Ka Taben, and she was accompanied by her children. She offered herself to *u Dkhar*, the plains man, as a household goddess, but he rejected her. She then went to the Khasis, who were ploughing their fields,

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

769 *Iawbei khynraw*, or *ka Iawbei kpoh* (the grandmother of the
211 family, or branch of the family). It frequently happens that there are two flat table-stones in front of the upright stones, the one on the left being *ka Iawbei tynrai*, or the first ancestress, and the one on the right *ka Iawbei longkpoh*, the grandmother of the branch of the clan to which the memorialists belong, or *ka Iawbei khynraw*, the young grandmother, i.e. the grandmother of the actual family to which the memorialists belong. In olden days it used to be the custom for the clans-
[782] people to place offerings of food on the flat table-stones for the shades of the departed ancestors, and this is sometimes the case still; but now it is more frequently the custom to make these offerings in the *iing-seng*, or clan puja-house. The flat table-stones are some 2 to 2½ ft. from the ground, and it is difficult to resist the impression that they were originally sacrificial stones, i.e. that animals or even human beings were actually
773 sacrificed upon them. In connection with this theory I would
782 refer to the interesting folk-tale about the Kopili river. It is here related that in olden days human victims were sacrificed
211 to the Kopili goddess on the flat table-stone (*maw-kynthei*) at a place called *Iew Ksih*, close to the Kopili river. A careful search has been made for this stone, with the result that a flat table-stone has been found near the above village, where goats are still annually sacrificed to the Kopili. The *doloi* reports that this is an ancient custom. None can remember, however, having heard that human victims were ever sacrificed there. Yet I do not think it at all unlikely that this is the stone, locally called *Mynlep*, which is referred to in the folk-tale. At Jaintiapur and Nartiang, both of which places were the headquarters of the kings of Jaintia, there are very large table-stones. We know for a fact that human sacrifices used to take place at Jaintiapur. Is it possible that human beings were immolated on these table-stones? It would be unsafe to base any conclusion on the solitary folk-tale about the *Iew Ksih* table-stone; but the tale certainly furnishes food for reflection. The Khasis borrowed their
[177] religious customs largely from the Synteng inhabitants of
782 Jaintia, and it is possible that they may have obtained the
211 custom of erecting the table-stones from the Syntengs also,
769 and that the latter were originally used by both of them for sacrificing human victims.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

SECTION VI.

MISCELLANEOUS.

TEKNONOMY.

551 THE Khasis, like the Alfoors of Poso in Celebes, seem to be somewhat reluctant to utter the names of their own immediate relations, and of other people's also. Parents are very frequently called the mother of so and so (the child's name being mentioned), or the father of so and so, cf. *Ka kmi ka Weri, U kpa u Philip.* The actual names of the parents, after falling into desuetude, are often entirely forgotten. The origin of the practice may be that the Khasis, like the Alfoors, were reluctant to mention their parents by name for fear of attracting the notice of evil spirits. The practice of *teknonomy*, however, is not confined to the Khasis or the Alfoors of Celebes (see footnote to page 412 of the "Golden Bough"). The custom is also believed to have been prevalent to some extent not long ago in some parts of Ireland.

797 The advent of the Welsh Missionaries and the partial dis-
177 semination of English education has in some cases produced
551 rather peculiar names. I quote some instances:—

U Water Kingdom, Ka Mediterranean Sea, Ka Red Sea; U Shakewell Bones, U Overland, Ka Brindisi, Ka Medina, Ka Mary Jones, U Mission, and Ka India.

KHASI METHOD OF CALCULATING TIME.

805 The Khasis adopt the lunar month, *u bynai*, twelve of which go to the year *ka snem*. They have no system of reckoning cycles, as is the custom with some of the Shan tribes. The following are the names of the months:—

805 *U kylla-lyngkot*, corresponding to January. This month in
132 the Khasi Hills is the coldest in the year. The Khasis turn

P. 181

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

or difference. It is owing to these three different names being 101
used for the same people that there has been so much confusion
about Lynngams previously; e.g. at one census they were named
Lynngam, at another they received the appellation of Garo, and
at a third enumeration they were called Khasis. In Section I. 131
the habitat of the Lynngams has been roughly defined. It is 361
impossible to define the Lynngam country exactly, because 173
these people are continually shifting their village sites
owing to the exigencies of *jhum* cultivation, which has been
described in Section II. Some of the Lynngams preserve
a tradition that they originally came from the Kamrup
plains. It is interesting that a people, like the Garos in so
many respects, should have the same idea as the Garos as to the
hills on the south bank of the Brahmaputra not always having
been their abode. The Garo legend is that they dwelt for 173
some years in the Goalpara and Kamrup plains after they 361
descended from Thibet, and before they moved to the Garo 144
Hills; and there is unmistakable evidence of their occupation of
both districts in the shape of certain Garo villages on both
banks of the Brahmaputra for some little distance up the river.
If, as I suspect, the Lynngams are an offshoot of the Garos, it
is, perhaps, possible that they entered the Khasi Hills much in
the same way as the Garos entered the hill district to which
they have given their name. The Lynngams are much darker 142
than the Khasis, and possess the Thibeto-Burman type of 177
feature often to a marked degree. It is not extraordinary that
they should have adopted some of the Khasi customs, for the
Khasis, being the stronger people, would in course of time be
bound to influence them in this respect. That the Lynngams 611
observe the matriarchate and erect (some clans) memorial 211
stones is not peculiar, because the Garos, like the Khasis, are 764
also a matriarchal people (to a limited degree), and the custom
of erecting memorial stones is not confined to the Khasis, for
other hill tribes in Assam observe the practice, e.g. certain
Naga tribes and the Mikirs; and the Garos themselves put up
carved posts, called *kima*, in honour of the departed. Although 582
there is not much intermarriage between the Khasis and the 101
Lynngams nowadays, perhaps in days gone by there was a 147
mixture of blood, the result being the hybrid race we are now
considering.

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

291 small kilt), and a cap which is peaked in front and which comes down well over the ears, called (*ka tupia shkor*) ear cap. The dress of the Khasi females is somewhat different from that of the Synteng, the former wears a striped cloth tied round the waist, hanging down to the knees, and another cloth, with a fringed border, knotted on both the shoulders to cover the bust and a narrow cloth, called *ka jympien*, to serve the purpose of under-clothing. A cloth knotted in front is also worn like a cloak over shoulders. The Synteng woman wears a cloth smoothed round the body fastened above the bust and drooping down to the ankles. Another cloth is thrown over the shoulders, and crossed in front. Both Khasi and Synteng women wear a cloth tied over the head, called *ka tap mokhkhlieh*. Up-to-date Khasi males wear knicker-
292 bockers, stockings, and boots, and females chemises. On festive occasions, both Khasis and Syntengs, males and females, wear expensive silks, with earrings of gold or silver. There is a special dancing-dress of
301 elaborate pattern: The women at festivals wear a circlet of silver with a spear-head ornament behind, rising 4 or 5 inches from the back of the head. Large coral beads are much valued, and necklaces of alternate beads of coral and gold, and sometimes of coral alone, are worn by the chiefs and their principal followers. Such necklaces are worn by
262 women also on *gala* occasions. The staple diet of both Khasis and Syntengs is rice and dried fish. They are, however, fond of all kinds of meat, especially pork. Some of the Syntengs abstain from beef,
[177] owing no doubt to Hindu influences. Neither Khasis nor Syntengs eat dog, which is partaken of with zest by the Naga and the Garo tribes,—this is owing to the dog being considered by the Khasis to be the friend of man. Neither Khasis nor Syntengs use milk, the latter being thought by them to be an excrement. Neither Khasis nor Syntengs
411 tattoo. The weapons of both Khasis and Syntengs are bows and arrows, swords and shields. The national game of the Khasis is archery, regarding which a detailed description will be found in paragraph 10.

361 The people live in regular villages on fixed sites which have not changed for generations,—and they appear to be much attached to these sites, where, as a rule, the family tombs are standing. The houses are
342 built in the shape of a shell, the houses being divided into three compartments,—the *Shyngkup*, or porch, where odds and ends, and sometimes fowls, are kept; *nengpei*, or centre room, which is used for cooking and sitting in; and *rumpei*, or inner room, where the people sleep. The houses are low, with grass roofs reaching nearly to the ground, the beams are of hewn timber, the walls are of either planks roughly hewn or of reeds or split bamboos plastered with clay. The Khasis' houses generally have boarded floors raised some feet from the ground level,

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

—the *Shyngkup*, or porch, being flush with the ground. The *nengpei*, or 342
centre room, is approached by a flight of steps. There are no windows, except one, which is bored on one side to admit light and air,—this is called the *pongshai*. Both Khasis and Syntengs, like other Indo-Chinese 524
races, are much addicted to gambling, and drinking to excess is a 273
national vice. Christianity has, through the agency of the Welsh Cal- 797
vinistic Mission, gained a very striking extension, and may be said in- 177
deed to be leavening the whole nation. Schools are numerous, and are pretty well attended by girls as well as boys. The Christians, and those who have come under the influence of Christianity, have adopted a high standard of comfort, and their houses resemble English cottages more nearly than the huts with which one is familiar in India.

Agriculture.—The Khasis do not use the plough; they cultivate their 241
fields with a peculiar-shaped hoe, or *mohkhiew*. They cultivate rice in the valleys, the rice being sown broadcast and the fields irrigated often after considerable labour. They also cultivate hill rice on the uplands, which they sow broadcast. The potato, which was introduced into the [177]
Khasi Hills by Mr. David Scott about the [439]
year 1830,[1] is extensively cultivated and forms one of the principal articles of export. Job's-tears (*Coix lachryma*), several kinds of millet, Indian-corn, the *Sohphlang* (*Flemingia vestita*), are also largely cultivated. The valleys on the 245
southern slopes of the hills have extensive orange groves, the oranges, especially those grown in the neighbourhood of Shella, being famous for their quality. The betel, vine, and areca nut are also largely grown on the southern side of the hills and in the low valleys, these plantations being irrigated by elaborate systems of aqueducts. The leaf of the bay tree (*'latyrpad*) is collected, and is exported to the Sylhet plains. The [439]
Syntengs differ from the Khasis, in that they make use of the plough. Both Khasis and Syntengs are industrious cultivators, and they possess a certain rough and ready knowledge of the uses of manure. A more detailed description of agriculture in these hills will be given in the monograph.

[1] Khasi and Jaintia Hills Administration Report for 1875-76 by Colonel Bivar.

2. *Matriarchal customs and law of inheritance of property.*—The 611
mother is the head of the house, and is both owner and the custodian of 428
the family property as long as she lives. Males can own no property amongst either Khasis or Syntengs except self-acquired property. On the death of the mother, in the case of the Khasis, the family property passes to the youngest daughter. According to some authorities, however, the property would in practice be divided amongst all the surviving daughters. Failing daughters, the property passes to the youngest niece, and failing a niece, to the youngest female cousin. The same

10: Clarke U-3 (no date)1874 AR7 Khasi AR7

Until the English period, say up to 1828, it does not appear that the Hindoos penetrated much into the Khasi hills; but they did into the Jaintea hills, and I imagine that either themselves or their handicrafts reached as far as Nurtiung. There is a typical large monument of upright slabs at Jainteapore, the capital of the Jaintea plains. 211 177

14. The notes for the above account of the stone monuments of the Khasi hills were placed in the hands of Colonel McCulloch (late Governor-General's agent at Muneypoor), and I have availed myself of many suggestions which he has kindly given me in the present paper. 000

Discussion.

Major Godwin-Austen said, one of the most interesting points of Mr. Clarke's paper is the notice of the separation of the ashes of the men and women of a family, at certain intervals, into separate earthen pots. I may mention that the shape of the cysts is never the same in any one part of the Khasi hills; sometimes they are oblong and above ground, and sometimes they stand on a raised platform. On opening one, in a part of the country long since deserted, I found entire bones, calcined, and ornaments; these are now always taken off the body before cremation, but, evidently, in former times, were burnt with the dead. The distance the Khasis sometimes carry the monumental stones is considerable. I know of blocks of granite that have been taken into the sandstone area nearly four miles. The custom of setting up these stones is fast dying out, and some villages have given it up altogether. It is impossible to say what age some of the monoliths may be; all history of most of them is gone, and the present generation can give no account of them. The custom is one of great antiquity, I think, and there is no reason why some of the stones, now standing, may not be many hundred years old.

Mr. A. L. Lewis said, if he, as a visitor, might be allowed to make a few remarks, he would suggest that there was no reason whatever for connecting the monuments of the Khasis with those of Britain. Mr. Clarke had spoken of stones lying round Stonehenge as showing that the stones composing it had been gathered close at hand; but this was not so, as they had been brought from a distance of some miles, and there were no loose stones lying round Stonehenge, except those which had been placed there by design. That design was found running through all the British circles that he had seen; but it was certainly not found in the Khasi monuments. It was, however, found in the circles in southern India, figured by Colonel Forbes Leslie, which differed, therefore, from the Khasi monuments, and resembled those of Britain. He had pointed this out before the British Association as long ago as 1869, in a paper which would be found printed in full in the Journal of Anthropology, 1870, p. 286, and also in subsequent papers read before the Anthropological Society and Institute, and published in the proceedings.

12: Mukherjee et al. E-4, 5 (1940) 1941 AR7 Khasi AR7

342 huts the ground plan is entirely rectangular. In this type of huts the materials used are also different, the corrugated sheets and wooden planks being more used than blocks of stone and thatching grass. The inner apartments, however, conform to the old plan. In the market place of the village there are some houses which are two-storied, the front of the ground floor of which have been utilised for shops. These houses do not at all conform to the old 'U'-type but are square or rectangular in 342 ground plan. Near the market place there are three houses 177 of well-to-do Khasis which resemble the bungalows of Europeans of Shillong (and of the Mission house at Mawphlang) in their structure and material. In these modern houses unlike the old ones the main door faces the street. The myntr U. Suburai who is one of the well-to-do persons of Mawphlang village has his old house (that is, the old house he put up for his wife after marriage) of the 'U'-type, the description of which has been given in the preceding table under the name of the owner, the wife of U Suburai, Ka Shyrngeh. But their new house which has been added to their old one in front of it is altogether of the bungalow type. This new house is entered from a porch in front, leading to the central room which is used as parlour. The myntri generally sits here with his friends, round the fire-place, which is not a Dypei but a hearth in European style. The kitchen is beyond this room. Bedrooms open from the drawing room to the sides.

342 A plan of the village showing the distribution of the various 361 types of hut in Mawphlang is given below. From the plan it 177 will be found that out of the 160 houses in the village, inhabited at present, the typical 'U'-type of huts form about 11·3 per cent.; the flattened 'U'-type about 35·0 per cent.; the intermediate type, which has totally given up the 'U'-shaped ground plan but has its interior of the old type, about 27·5 per cent. and the English bungalow type about 26·2 per cent. This data shows how rapidly the old type of Khasi hut is now changing.

596 extended form more often when the children of the deceased sisters of *Ka-khadduh* reside there. This extension is on the mother's side and is affiliated through the extension of mother-child relationship.

Additional members like widower brothers or widowed sisters make the Khasi family a composite one.

In a Khasi family father, mother and her brother are very important. Father who is regard[1] as *Mynder* (stranger) or *Ushong kha* (begetter), has also the position of *Kynrad* (master) of the house (set-up by him). He is the executive head and the mother is the *dejure* owner of the household.

177 178 604 593 [428] Modern conditions and spread of Christianity have greatly affected the Khasi society and changed the Khasi ways of life but have failed to alter the traditional mode of inheritance even among the Christian Khasis. Another important fact which is apparent in the Khasi families, is the change of the status of the mother's brother (*Uknii*) in his sister's house. His influence has greatly been diminished due to clash with *Ka-Khadduh* (heiress). He has almost lost his control over his sister's [562] family. This has made the women exert their status to a danger point. Consequently, some amount of maladjustment in the relationship system, moral depravity and disintegration loom large in the family horizon.

Family is the core of Khasi social organization and the 596 closeness of familial kin with the members of the sub-clan is 613 due more to the fact that sub-clan owes its development to the family. A *Shi-K'poh* (member of sub-clan) is a secondary relative and can easily be approached for any help.

The functions of the above mentioned social groupings are 614 as follows :

Clan (*Ka-Kur*)—It regulates marriage. It being a larger non-residential kin group contact between its members is infrequent. The amount of social participation needed on certain level to intensify the relationship among its members falls far short of. But nevertheless, there existed among the members

614 764

[1] [Should read: regarded. — Analyst]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Thus, the marriage of a non-heiress and a man of authority also produces an unstable position for the husband in spite of his having an independent household. Therefore, the possibility of a really stable marriage is even more limited; it will occur only in the match of a non-heiress and a non-authority of the *iing*. But even these marriages cannot be free from the influence of a matrilineal social structure: the man of authority of the wife's *iing* may visit these couples now and then, curb the husband's power and remind both partners of the orientation towards the matri-kin, the *iing*, though this pressure is insignificant in comparison with that experienced by the heiress's family. Likewise, a husband now and then visits his youngest sister's house, *ka iing sen*. These constant matrilineal contacts offer husbands chances of escaping from even the slightest matrimonial tension. Whenever a Khasi man feels uneasiness, he will return to his sister's house rather than face a difficult situation with his wife. This tendency is maximised especially on the occasion of religious ceremonies, when all individuals are grouped around each *iing*.

It is apparent that the rules of the *iing* as the underlying structural pattern, function throughout the various categories of domestic unit of the Khasi community as the most important intrinsic force.

VII. Polygyny

After this long attempt at the structural analysis of marriages, I think one can theoretically predict what is the situation of polygyny among the Khasi. The theoretical framework elaborated through preceding discussions can also be tested by the empirical data in terms of polygyny.

Nowadays, the Khasi feel so strongly against polygyny that they have no knowledge even that they ever practised it. Many Khasi, in more sophisticated areas, did not believe my findings on polygyny in Sohkynduh and Kongton. I think this is due to the rapid Christianization of the Hills during the last hundred years. My interpreter, though he was not Christian, said to me in the village, "it is most regrettable to bring you to a village where we find polygyny." However, one of the ministers of the Cherra State to which the two villages belong, told me that there was no particular opposition to polygyny, though recent Christian influence gave people the idea that it was a shameful custom, and he mentioned the case of a polygynist in his area, a man who had recently died, who had had ten wives. In Jatinga whose inhabitants are all Christian, and in Shella where there has been much contact with, and influence by, Hindus, there were

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Shella

Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards along the steep slope, looking down towards the Bengal plain. The climate of this part of the hills is considered to be one of the worst in tropical India for human habitation. The Bengal plain, though warmer than this area, is considered more healthy. This border land is the zone of malaria, typhoid, black fever, cholera, etc. None of the Bengalee peasants dare to live in such an area. However, it is the most fertile for products such as betel-nuts, pan-leaves, oranges, bananas and pineapples, and it also produces limestone. These people seem to prefer to settle in this zone and to enjoy its prosperity, at the expense of human lives: every year, especially between March and September, the inhabitants suffer from various fevers and dysentry and other diseaes, many of the weaker facing death. 131 132 164 433 164 648

Before the Partition of India and Pakistan, the products of Shella were carried down the Shella River to Sylhet, one of the biggest centres in East Bengal, which brought unimaginable wealth to the Shella people. Their houses were built by carpenters from Sylhet. The style and structure of these houses were exceptionally elaborate for the Khasi. They purchased vast rice fields in the plain, which used to be cultivated by Bengalee and Garo labourers engaged by them. These Khasi do not themselves know how to cultivate rice fields; they have always been managers or landowners. Their boys used to be sent to high schools and colleges in Sylhet. As a result of their trading with the Bengalee, many of them read and speak fluent Bengalee. There is no difference between their style of clothing and that of the Bengalee, though the women maintain their traditional dress in the Shella style. 177 178 434 [439] [342] [166] [464] [871] [191] [291]

They have thus been distinguished from the rest of the Khasi not only geographically, but also economically and culturally. Their personality also differs sharply from the rest of the Khasi. They are very sociable, and quick, a quality lacking among the Khasi of Sohkynduh and Kongton. They are clever enough to deal with strangers. The upland Khasi say Shella people are very cunning. This remark shows one side of these people. They had to be cunning, since they traded with the Sylhet Bengalee who were said to be the most cunning of their race. Their role in the trade and in the history of the modernization of the Hills was considerable. For centuries they represented intellectual Khasi owing to their contact with Hindu civilization, while the Hills remained in darkness. They assumed an important role when the British established an administration in the Hills, and even up to now, many leading Khasi originated from this area: for instance, Lati Hat, the first interpreter of the British Headquarters at Cherrapunjee; Jeebon Roy, who was the first Magistrate among the Khasi; Maham Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jeebon Roy); Nichols Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nichols Roy), Principal of the Gauhati University, etc. 157 184 648 177 178 [439]

Through constant cultural contact with Hindu, and encouraged by their economic prosperity, the Shella Khasi, like the Jaintias, have been much influenced by Hindu culture. However, this does not mean that the people of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, and some ceremonial elements were borrowed from the Hindu, most of the 177 648 771 795

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

• 177 people remained non-Hindu in their basic beliefs and social customs. Hindu
648 influences are nevertheless predominant in their culture, especially in their way
771 of living which shows a practical adaptability, somewhat similar to the Japanese
795 acceptance of modern western culture without becoming Christian. In my
[797] census of Shella village, the people calling themselves 'Hindu' amount to 40 per
[162] cent of the total, but they are the recent converts to the Ramakrishna School
[458] which established a missionary station at Shella after the Partition. The Christians constitute 30 per cent of the total, most of them having been converted during the last ten years, as in the case of the Ramachrishna School.[1] The rest remain as they were, of Khasi belief. These conversions to either Ramachrishna or Christianity seem to have been encouraged by the unstable situation of the people resulting from the recent economic depression in this area.

439 The Partition of India and Pakistan in August 1947, which drew the bor-
458 derline a few miles south of Shella village, considerably upset village economy
648 by stopping all trade with Bengal, though a limited amount of trade is allowed with local people at the border. Because of this political change, all the produce of Shella gardens is rotting away for lack of markets, while all of the rice fields were taken by Pakistan. Goods now come to Shella only from the uplands, carried upon men's shoulders over the most difficult pass, which makes everything very expensive. Many families have sold their gold and other treasures, and some families are facing starvation.[2]

182 Concerning the conversion to a new religion, an interesting phenomenon
171 is to be observed. The conversion to Christianity or to Ramakrishna is mostly
592 by individual: I found in my census that the wife and husband often belong to different religions. This is a very different picture from the Garo, among whom
613 I always found that the husband and wife belonged to the same religion: the
771 conversion of the husband to Christianity was always followed by that of the wife. I think this reflects the structural differences which influence the actual
795 relationship between the husband and wife. Among these Khasi, instead of the husband and wife, the maternal uncle and his nephews and nieces are mostly of the same religion. The function of the *iing*, the most important social and religious unit, thus appears also in the conversion to a new religion, stronger than that of a domestic unit.

Intermarriage.

648 The close economic and cultural contact of the Shella people and the Bengalee
771 is not matched by social contact. The essential barrier between the two peoples is the difference of religion which dominates the entire social order in each
563 society. Though these Khasi were important traders, richer than the neighbouring Hindu peasants, they were considered by the Hindu as outcasts with whom they never shared social activities. Intermarriages were therefore very rare. In Shella village, only two exceptional cases were found in my census:

1. A Khasi woman married to a Gurka (cattle-keeper); they live at Shella Bazaar (Sholap).
2. A Khasi woman h[illegible] marital relation with a Bengalee medical doctor who has resided at Disong in Shella for six years. He already has a Bengalee

1. These two entirely different missionary activities are competing with each other, and are somewhat related to the political powers within this area.

2. The state government is doing its best to provide them with additional facilities: for example, providing air transport for the transportation of oranges from Shella to Gauhati and Calcutta. However, such arrangements cannot cover the great economic loss suffered by the Shella people.

thereafter, the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contracted that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, judging cases of heinous crimes, approving the popular selection of any new chief, and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life, and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Mills (n.d.): (1) The British introduced the potato, which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive specialization exhausted the soil and made for ever-poorer crops. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should inherit property that traditionally was earmarked for her performance of non-Christian religious rituals. (3) About 1864 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to marry with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the accelerated enrollments in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the Independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi-Jaintia Hills District became a Part B, or Autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The native-state system and the chiefs still exist, and the District Council finds it difficult to effect legislation which is neither offensive to regional custom nor a simple blueprint of ill-fitting all-India legislation. The major political schism at this time is between Jaintias, who are accustomed to centralized authority and taxation, and Khasis, who resist the notion of taxation to support the work of a central District Council. [Cf. Gait 1928; Aitchison 1931; Bhuyan 1949; Morris 1910.]

SETTLEMENT PATTERN AND HOUSING. Settlement pattern. Khasis live sedentarily in nucleated, nucleated, and unplanned villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a de-

361
[312]

pendable water supply. Villages are about two to five miles apart, and have no boundary markers. In the past, villages contained semipublic buildings and grounds: the house of the village priest (also the house of a chief if he resided in that village), the village marketplace, and tree groves, cremation grounds, or other awesome spots that were believed to be inhabited by supernatural beings. Villages today may have also one or more Christian churches, government social welfare buildings, and schools. Formerly, villages were entered through a guarded gateway; this is no longer the case, and paths feed into villages from all directions. Often several villages are nucleated into one large unit, named and also described as a "village." These were once defense units, but were so uncohesive otherwise that institutionalized rivalry obtained among the component villages. Now, they have been integrated through the agency of all-village public services, especially schools. **Housing.** The traditional Khasi house is entered through a door at the rounded end of a U-shaped ground plan, and is about 20 feet at widest extent; it is about 30 feet deep, and is elliptical or hogback in profile. Its walls are of stone blocks cemented with mud. The roof of grass thatch, supported by a bamboo frame, overhangs the walls on their outside, down to about three feet above the ground. The house is divided into two parts: the front one-third is on the ground level, floored either with stone blocks or tamped earth, and is used for storage of occupational instruments and as a shelter for poultry. The rear two-thirds is raised four feet on piles of stone blocks to a platform of planks, and is partitioned into six rooms, comprising a kitchen, areas for storage of food and water, and sleeping quarters. Furniture is minimal, and the house is totally undecorated. There are no windows, and no smoke vents. A house generally has a companion shed, walled of wood and grass matting and thatched with grass. This serves as a pigsty, but it may be partitioned also to house cows, and it may have a loft for fuel storage. Compounds often contain garden plots, and are fenced around with stone or bamboo and mud. Nowadays, the traditional house has given way to Western-style bungalows of wood and tin, especially in and around Shillong. [Cf. Mukherjee et al. 1941.]

361 [944] [443] [778] [344] [178] [712] [628] [178] [182] 342 352 353 354 343 361 177 184 342

ECONOMY. The Khasi economy is a market economy based on agriculture, and most Khasis are primary producers, sellers, middlemen, and/or providers of services in connection with markets. Khasis are often multioccupational: they produce goods for partial subsistence, and also play some part in trade. **Agriculture.** On the Shillong plateau, the major field crops are potatoes, maize, millets, and dry rice, still produced mostly through swidden farming, with a two- to three-year period of fallow, but increasingly through continuous use of a single field with the aid of ma-

241 433 443 [463] 241

manure and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques. 1 × 0.6-mile patches are fashioned with walkways between, soils are overturned within the patches and allowed to dry, the soils are burned slowly and the ashes spread over the soil, and finally the soil is sown, either broadcast or soils with the aid of the typical Khasi hoe. The outdoor part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Khasi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have home gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, eggplant, sweet potatoes, [illegible] and many others. Important crops in Khasi country are paddy rice, lac, cassava, cotton, bananas and pineapples, in War, they are betel nut, pan leaf, oranges, and sugar cane. Fishing and hunting. Fishing is always by [illegible] extensive activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stagmiller 1955.] Gathering. Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thirty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. Domestic animals. Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats range freely in the fields during the winter, but are herded by a commonly hired herdsman during the agricultural season. Most households keep chickens, partly for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for hunting dogs. Cats are popular. Food and stimulants. The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain clans. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Khasi country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

children, but Christian influence has weakened or driven underground the conception by women and children. Industrial arts. The only industrial arts universally practiced in all households were a rude monitor carpentry and a simple utilitarian basketry. Other arts were few, and were practiced in village specialties: the working and smelting of iron ore and the forging of bows, dues, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mawsynram village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintia, Khasi, Langpungsu, War); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Khasi and Jaintia); and the hand manufacture, without wheel, of pottery earthenware pots (Lawai village, Jaintia). Handweaving and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. (J. Dupuch 1906, C. W. Hill, Trade. Khasi villages normally contain a number of household shops operated by women. Every Khasi [illegible] within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market attendance for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small cows contain at least some local farm produce, plus other essentials like betel nut, and the betel and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade from the hills to the valleys, as potatoes, pears, betel, tea, cotton, cured cheese, the wood of the ai tree, Eri silk thread, limestone, coal, soap, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, oil, turmeric, and chillies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, bananas, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, ornaments, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, affirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. (J. Dupuchez 1906.) Division of labor. Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and sewing, and driving and laboring on motor vehicles. They also take care

another. In other words, a state is not a fixed territorial entity. In the early twentieth century, the most populous of the 25 chiefdoms, Khyrim, contained 30,833 persons occupying 7,800 houses in 372 villages, and the least populous, Nongkwai, contained 248 persons occupying 33 houses in 3 villages. Fifteen of the chiefdoms were headed by a *sjem* (chief), three by a *lyngdoh* (priest), six by a *siular*, and one by a *wahadadar*. These leaders all had executive and judicial functions, but a chief's authority was limited in that he had to obtain the approval of his executive council before acting. The other leaders were subject to a similar limitation. A chief maintained a small police force. His major sources of revenue were market tolls, fines, and, more recently, income from licenses to distill raw whisky. Succession to a ruling role in the larger states traditionally involved election by members of a lineage that had a hereditary right to elect, from among members of a lineage that had the hereditary right to rule. In British times, the elective basis was broadened, differentially in the various states, even to the point of popular

000 175 619 62 (161) (793) (651) (666) (177) (178)

stratification. The three classes of lineage are the nobles, the commoners, and the slaves or servants. This stratification applies only to the recruitment to office in the native-state system, for there is no hereditary, and in a village assembly everyone has equal voice. The noble lineages have the hereditary right to fill from among their male members roles such as village or state priest, councilor to a chief, or elector of a chief. The few lineages which today are remembered as slave or servant lineages had the inherited obligation to render special services to a chief's household. There is no Khasi term for "commoner." Every lineage other than a noble or a slave lineage is a commoner lineage, and the commoner lineages are in the majority. Warfare. Warfare was suppressed by the British, and little is known for certain about its traditional forms. The tactics which confronted the British were the ambush and the guerrilla raid. Traditional goals included taking heads from other Khasis and capturing women from the villages.

000 623 621 567 72 (177)

RELIGION. Major and indigenous religions. A Welsh Calvinistic Methodist missionary penetrated into Cherrapunji in 1841, and the work that he began continues to this day. His society, which has since become the Welsh Presbyterian Foreign Mission, introduced writing, village primary schools, a high school, a theological seminary, and a hospital. Competing missionaries followed, and by 1914 some Shillong Khasis were puzzling over the tenets not only of traditional Hinduism and Islam but also of the Buddhists, Brahmo Samaj, Arya Samaj, and Unitarians (Roy 1914). By the 1930s missionaries of the Church of God and the Seventh Day Adventists were

797 17

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

The forest administration of the British Government is confined to two plantations in the neighbourhood of Shillong, for which a rent is payable in perpetuity. One of these, on the farther side of the Umkra, was originally acquired in 1871-72 for the sake of experiments in arboriculture. The rent of Rs. 50, or £5, is paid by the Forest Department; the area had been at first estimated at 580 acres, but an actual survey undertaken in 1875-76 reduced this estimate to 262·59 acres. A considerable portion is covered with Pinus Kasia, which is carefully protected. Of the exotic trees tried on this plantation, only the three following can be said to have done well:—*Juglans regia*, *Eucalyptus resinifera*, and *Pinus maritima*. All the rest either suffered from frost in the winter, or required far more nursing than can be afforded them in forest plantations. The young trees of the indigenous oak (Quercus serrata) were also attacked by rats, who bit off great numbers just above the ground. The Spanish chestnuts did not thrive, and were removed to the model farm for trial at a higher elevation. The second plantation, on the northern slopes of the range immediately behind the Station, consists of several patches of forest, which were acquired in connection with the scheme for providing Shillong with a permanent water supply. The total rent is Rs. 375, or £37, 10s., paid from Town Improvement Funds; and the aggregate area is estimated at 796 acres. All the fields within this area that had formerly been cultivated by the Khásís—about 80 acres in all—were sown by the Forest Department with Pinus Kasia, Quercus Griffithii, Q. serrata, and Q. fenestrata, which have succeeded well; and about 8 acres were planted with different species of Eucalyptus. Up to the close of 1875-76 the sum expended on the first of these two plantations was Rs. 742. 9. 9, or £74. 5s. 3d., and on the second, Rs. 730. 9. 6, or £73. 1s. 2d.

137 648 65 311 177

A cinchona plantation was started in 1867 by the Superintendent of the Calcutta Botanical Gardens. It consists of twelve small patches of plants near Nongkloo, and one near Jirang, situated at elevations varying from 3500 feet to 2000 feet. The species cultivated are Cinchona succirubra, C. officinalis, and C. micrantha. At first they were under the charge of two Khási gardeners, who each received Rs. 16 a month, or £19. 4s. a year, to weed them and keep fires out. In 1874-75 these plantations were taken charge of by the Forest Department, and specimens of the cinchona bark were submitted for analysis to the Government Quinologist

generally the gathering does not extend beyond January. As a rule, the cultivation is confined to the valleys and slopes on the southern face of the hills. (2) Pine-apples are also largely cultivated on the southern slopes, and grow to great perfection on the limestone formation. The fruit ripens in May or June, and is exported in considerable quantities. In 1876-77 the export of pine-apples was valued at Rs. 8000 or £800. (3) Potatoes are extensively grown on slopes of high land, and also in the low-lying fields where the land is well drained. The tuber was first introduced into the Hills in 1830 by Mr. Scott, who was then the Governor-General's Agent. The season for sowing commences about the middle of February when the rains set in early, and in April when they are late. The ground is dug up and carefully manured with burnt earth, and holes are dug about nine inches deep, and the same distance from each other. These holes are then partially filled in with loose earth, and a potato or two halves of one placed in each. They are then filled up with dry manure and soil. When the plant is fifteen or twenty days old, the ground about the roots is loosened and the plant earthed up, and the land is kept carefully weeded. In about four months after sowing, the crop is gathered. During the cold weather a second crop is raised, the seeds being planted in September and the tubers dug up in December. Potato cultivation has largely increased of late years in the District. In 1876-77 the exports were approximately estimated at 200,500 *maunds*, or 7480 tons, valued at Rs. 501,250 or £50,125, at the rate of Rs. 2. 8 per *maund*, or £7 per ton. (4) Sugar-cane is grown, but not to any great extent; cuttings are planted in March, and the cane ripens by November or December. (5) *Pán* is extensively cultivated, the runner being trained up trees standing in deep and shady valleys. Planting is carried on during the months of April and May, but the leaves are not fit to be gathered till the plant is two years old. (6) The *supári* or betel-nut (Areca catechu), called *u-kwai* by the Khásiás, is grown on the lower southern slopes of the hills, and, together with the *pán* leaf, is consumed in immoderate quantities by the inhabitants, who measure distance by the number of *pánz* consumed on a journey. It is also exported to the plains. (7) *U-sok-phlang*, a root crop resembling a small turnip, is sown on high lands in April and gathered in September. It is a poor vegetable, but the natives of the Hills are fond of it, and eat it either raw or cooked. (8) Cotton is grown on high lands and

245 244 [439] [177] [439] 249 244 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

extent of waste land, some is cultivated in a manner resembling the *júm* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *júmid* tenure. Any renting of land is exceptional, and there are no recognised rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 [427]

MANURE is generally used in raising rice and potatoes. It is seldom purchased, the dung and litter of the cattle and other animals about the house being generally utilized for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 2s. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 12s. to 18s. per acre. 243 244 [435]

IRRIGATION for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills. 312

MODEL FARM.—The Shillong Model Farm, established in 1873, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red roughs' and 'pheasant's eye'—were successfully introduced in 1873-74; but these are not looked upon favourably by the Khásiás, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, nectarine, and plum; and the tables of the European residents are supplied with vegetables from the garden attached to the farm. A *Manual of Potato Cultivation* compiled by the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the unfitness of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1874-76 the sum of Rs. 1744 177 244 648 654 177 245 648 654 [134] [136] 231 648 654

This price is about the same as it was twenty years ago, but the quantity has increased fourfold. The potato was first introduced into the Hills in 1830 by Mr. David Scott, who was then the Governor-General's Agent. 'No greater boon could have been conferred upon the people.' The local trade is entirely in the hands of the Khásiás themselves, and the larger portion of the produce is despatched direct to Calcutta. According to the registration returns of river traffic in Bengal, the export of provisions (including vegetables) from Sylhet in 1876-77 was 123,108 *maunds*, valued at Rs. 369,324, or £36,932, at the rate of Rs. 3 per *maund*.

[177]
[244]

The export of oranges in 1876-77 was 9,400,000 in number, valued at Rs. 37,600, at the rate of Rs. 12 per 3000. These figures apparently show a great decrease since 1858. At that time Mr. Inglis possessed the entire monopoly of the trade, by means of the leases which he held from the Khási Chiefs of all the valuable groves. The annual produce of his groves was estimated at forty-five millions of oranges, having increased from eleven millions within the

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of

K [177] house with its curved roof form reflects the building style of the Bengali, who also in other respects influenced the customs of the Khasi (79),

79. To be sure the roof ridge of the Bengal hut is evenly curved toward both sides and the entrance is from the broad side. This roof style is a distinctive architectural theme with temples and tombs of Bengal, as Monmohan Chakravarti in "Bengali Temples and Their General Characteristics" Journal and Proceedings of the Asiatic Society of Bengal 5 (Calcutta, 1909), p. 160 explains in detail. But whether the relation with the Pallava architecture of South India exists, as conjectured here on p. 147, seems to me very doubtful.

or whether the roof, sloping down in front and projecting broadly over the entrance wall must be considered as a modification of the veranda awning of the pile dwellings.

596 extended form more often when the children of the deceased sisters of *Ka-khadduh* reside there. This extension is on the mother's side and is affiliated through the extension of mother-child relationship.

Additional members like widower brothers or widowed sisters make the Khasi family a composite one.

In a Khasi family father, mother and her brother are very important. Father who is regard[1] as *Mynder* (stranger) or *Ushong kha* (begetter), has also the position of *Kynrad* (master) of the house (set-up by him). He is the executive head and the mother is the *de jure* owner of the household.

177 Modern conditions and spread of Christianity have greatly
178 affected the Khasi society and changed the Khasi ways of life
604 but have failed to alter the traditional mode of inheritance even
593 among the Christian Khasis. Another important fact which is
[428] apparent in the Khasi families, is the change of the status of the mother's brother (*Uknii*) in his sister's house. His influence has greatly been diminished due to clash with *Ka-Khadduh* (heiress). He has almost lost his control over his sister's
[562] family. This has made the women exert their status to a danger point. Consequently, some amount of maladjustment in the relationship system, moral depravity and disintegration loom large in the family horizon.

Family is the core of Khasi social organization and the
596 closeness of familial kin with the members of the sub-clan is
613 due more to the fact that sub-clan owes its development to the family. A *Shi-K'poh* (member of sub-clan) is a secondary relative and can easily be approached for any help.

The functions of the above mentioned social groupings are
614 as follows :

Clan (*Ka-Kur*)—It regulates marriage. It being a larger non-residential kin group contact between its members is infrequent. The amount of social participation needed on certain level to intensify the relationship among its members falls far short of. But nevertheless, there existed among the members

614

4. The Bhoi — occupy the northern slopes of the Khasi Hills, covered with thick semi-tropical forests; they practise jhum cultivation. 619

5. The Lynngam — inhabit the western border of the Khasi Hills, near the Garo Hills. They are said to be half-Khasi and half-Garo. Their economy is similar to that of the Bhoi.

These ecological and geographical differences correspond also to 175
politico-historical differences. From the 16th century to 1835, eve
of the annexation of the Jaintia Hills to the Khasi Hills under the 648
British administration, the people of the Jaintia Hills formed part of the Hindu Jaintia kingdom, whose capital was Jaintiapur, on the border of the present East Pakistan and of the Jaintia Hills. The capital, at one time, was moved to Nortiang near Jowai in the heart of the Jaintia Hills. The Jaintia Hills were administrated by twelve governors. Such a highly developed economic system as based on wet rice cultivation, must have helped a great deal in forming a kingdom adjoining the plain. Through the common economy and political organization with the Hindus of the plain, the Hindu civilization of the Bengal plain penetrated deeply among the Jaintias, who are matrilineal hill dwellers.

On the other hand, the Khasi Hills have remained outside the histories of either Assam or Bengal. They were governed by a number of petty native chiefs: there were twenty-five chiefs ruling the Khasi Hills when the British colonial administration was established there. Most of these chiefs belonged to the Siem clan. The history of the Khasi Hills had been shrouded in darkness till the beginning of the 19th century, except for fragmentary stories such as Khasi raids on the Sylhet people.

The development of the upland Khasi Hills started with the estab- 178 •
lishment of its headquarters at Shillong in 1874. Since then the
features of the Khasi and Jaintia Hills have changed a great deal. 648
What was once a small Khasi hamlet, untouched by the light of 797
history, has become nowadays a busy modern town where many Khasi intellectuals live, mixing with various outsiders who are engaged in official work or in business. The British administration opened the way to missionary activities, especially that of the Welsh Calvinist Methodists who set up a mission in the Hills in 1841, almost at the same time as British political influence began to make itself felt in the
Khasi Hills. Along with the political penetration from Cherrapunjee [871]
(1833) to Shillong, missionaries established many institutions, includ- [743]
ing churches, schools and hospitals, etc. Christian education, bringing with it the promise of clerical positions, attracted young Khasi a great deal; and the majority of the upland Khasi have been converted to Christianity. They have become the modern intellectuals of their people.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

137 Besides these political and religious changes, there have been very
178 important changes in Khasi economy, particularly by the spread of
244 potato cultivation. Potatoes were first introduced into the Hills in 1830 by Mr. David Scott. Since then, the upland Khasi Hills have been completely planted with potatoes. This grassland seems to be very easily adapted to potato cultivation; it spread so rapidly and successfully, becoming basic economy of the people, that they hardly remember life without potatoes. Information is very scanty on what was the major cultivation before the potato. However, we may surmise that they must have practised jhum cultivation as do the present people in War and Bhoi. Nowadays, there are no jhum fields in the uplands as there are practically no forests with which to make jhum fields. There must have been a long period of jhum cultivation, which resulted in recent ecological changes in the uplands through the exploitation of the jungle. This hypothesis might be supported by the existence of big timbers in old buildings in the Khasi Hills, as well as by the present economic techniques of the people.

137 The present potato cultivation is also a kind of shifting cultivation
244 like jhuming, with a rotation from three years to five years. The
241 uplands are covered with grassland, and sometimes with scanty pine trees which were also introduced by the British. For potato cultivation, the Khasi first cut branches from these pine trees, and the grassland is cultivated by the small Khasi hoe. They root out grasses with earth attached about three inches in depth and one foot square. These pieces are turned unto the cultivated surface, where fallen leaves, branches and wild grass have been spread, in such a way as to keep a space between the ground and the turned up clods of earth. The field in which the potatoes are to be planted is entirely covered in this way. The grass and leaves are set on fire in one corner of the field and this fire spreads through the middle spaces and burns all of the grass and branches, thus converting it into excellent manure. The potatoes are planted afterwards. Two crops of potatoes are raised generally in a year. The following year the field is shifted to another grass-growing area, leaving for a few years the last field to grow another crop of grass. This is a type of small-scale jhum cultiva-
178 tion. This example of the present economic method suggests that
244 the Khasi had been jhum cultivators before potatoes were introduced.
[241] It might be indicative of the last stage of jhum cultivation when the forests are completely exhausted. Before the potatoes, they must have grown yams, maize and millet more or less in the same manner; these items are still cultivated on a small scale along with potatoes; the yield must be very low as compared with that of the War areas, obtained through the exploitation of land. In the uplands, pan culti-

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

vation is impossible because of the cold climate. In the past, Khasi economy must have remained at a very primitive stage. 178 244

Potato cultivation has been much encouraged along with the development of Shillong and the opening of the motor road to Gauhati from Shillong after the Independence of India when Shillong became the seat of the Assam Government, as well as the capital of the Khasi-Jaintia Hills. Shillong has become an important trading centre, where big merchants collect the harvests of potatoes in exchange for rice, clothes and various other goods from the Assam valley. These changes have introduced the Khasis into an active commercial economy which again has brought about various changes in their social life. Recently coal excavations have started in the upland Khasi Hills, and many Khasi become miners. 178 433 369 [244] [633] [491] [439] [316]

Thus the history of the Khasi Hills during the last hundred years has changed a great deal the picture of the Hills. However, dark corners still remain in Bhoi, War and in the area bordering on the Garo Hills. These have been kept in a vacuum between the Hindu civilization of the bordering plain and the modernization of the uplands centred in Shillong. In these areas, the people are still practising primitive jhum cultivation. I have chosen two villages in War located in one of these area as subjects of my major field-work. 178 184

[P. 100 is blank]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

exception. As I pointed out in the last chapter on the Garo, private ownership started with wet cultivation. In Kongton, there are no common (village) or clan land: every piece of land is owned by some household—more precisely it is owned by the woman, the head of a household, and managed by her brother or maternal uncle. The majority of households in Kongton possesses land. Some of the richer households lend the land while some of the poorer households lease it. The rate for leases is Rs. 90/– per year for an area where one maund (80 lbs.) of millet seeds can be sown. As there is no acreage system, the measurement is by quantity of seeds, and since shifting cultivation requires a change of field every year, the rent is fixed by the year. The pan-leaf gardens, also privately owned, are never leased. When labour is required, the owner engages villagers, paying them Rs. 3/- per day. 423 423 427

In Sohkynduh, there are some lands called "clan land." Throughout the history of the formation of Sohkynduh village, as reconstructed from my data, can be traced some evidence of the evolution of land ownership. The first inhabitants of Sohkynduh were said to be the people belonging to the Prarian clan (See Lists 6 and 7). It seems that when the Prarian came to this site, the land already belonged to the Dkhar clan of Rymmai village, five miles north of Sohkynduh. The present distribution of land ownership confirms this story. The jhum field belonging to Sohkynduh is divided into four sections according to the locality: 178 423 614

1. Lum Sohkynduh 2. Sohliang
3. Mawkhalai 4. Lumpalong

One part of Lum Sohkynduh belongs to the Prarian clan. The rest of Lum Sokynduh, Sohliang and Mawkhalai belong to the Dkhar clan of Rymmai village, the management of which is in the hands of Phrensing who came from Rymmai and married a woman of Sokynduh. Lumpalong is owned by Sor (Kynshah clan, 32 of List 6) privately. The Prarian and Dkhar lands are used by their descendants respectively. The people of other clans have to pay a rent of Rs. 80/– to use these clan lands. For the land which belongs to Sor, even the people of the same clan (Kynshah) have to pay rent since this land is privately owned. Thus the land of Sohkynduh belongs partly to particular clans and partly to a private owner. [427]

Gurdon explains the existence of the clan land in the Khasi Hills as follows:

"The clan lands originally, when population was sparse, were owned by families, but as the members of the family increased and a clan was formed, the lands became the property of the clan instead of the family. Such clan lands are properly demarcated by stone boundary marks. The manager of the clan

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

178 lands is the *kni* (maternal uncle of the youngest daughter of the main family,
423 or branch of the clan), whose house '*ka iing khadduh*,' or last house, is the place
614 for performing all the religious ceremonies of the clan, and is also called *ka iig seng*. All the members of the clan are, however, entitled to share in the produce of any of the clan lands they may cultivate. No clan lands can be alienated without the consent of a durbar of the whole clan" (Gurdon, 1914, p. 88).

178 Theoretically we can assume that the land was owned by the family
423 (precisely, *iing*, the matrilineal descent group at the lowest segmenta-
428 tion, the structure of which will be discussed later) who first claimed
614 the right to the land, and was managed by the maternal uncle of the youngest daughter, the heiress entitled to the property. In course of time, with the increase of the descent members and with fissions of the descent group, this land was inherited through the youngest daughter's line, but other members who had become segments of the main descent group had a right to use the land, so long as they remained in the same area. Newcomers who belonged to another clan were not granted the same right and had to pay rent. According to the information I was able to collect, even people of the same clan could not claim the right to use the land, unless they were the direct matrilineal descendants of the women who first owned the land. In this sense, the descent group solidarity at a lower level is much stronger than that of the Garo.

Therefore, newly possessed or purchased land is always owned by the individual family (*iing*, descent group). This Khasi conception of land ownership produces a picture of predominant private ownership of land, combined with high geographical mobility of the population (see p. 112). In such circumstances, it seems that even the land called "clan land" has been alienated or sold frequently, and has developed small holdings to suit the small segments of descent groups. In particular, when the entitled owner moved away to another area, the land was sold. For instance, in Sohkynduh, the maternal uncle of Sor (mentioned above) purchased the land indicated above about ten years ago from a family of Siem Lyngngoh who left for another village. This land was originally purchased by the Siem Lyngngoh from the Dkhar to whom the land belonged as part of the clan land.

Under this system, clan ownership of land can develop only (1) when the members of the descent group remain in the same community for a considerable period and (2) when there is sufficient land to acco-
178 modate all members. I think these are the main reasons why land-
423 holding at present among the Khasi is found to be in small descent
428 groups—in one household as in Kongton in most cases, and this I call private ownership. For the second reason, further explanation is

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

necessary. The chances of acquiring a piece of land nowadays are small, except for very successful men, and usually the size of the plot is only just enough to maintain one household. When this land is passed on to the next generation, the youngest daughter will hold the title to it. This fact tends to exclude married elder sisters from the right to use the land, since it is not sufficient for more than one household. Thus the ultimogeniture succession rule seems to have developed more sharply and to have encouraged limited inheritance in conjunction with the shortage of land. 178 423 428

This tendency creates unbalance in the economy of the households within a community. It is a usual picture in Khasi villages, for the bigger and well-built houses to be occupied by the youngest daughter's family, while the elder sisters reside in poor huts. Youngest daughters are usually landowners, while their elder sisters have often to become day-labourers after their marriage, unless their husbands are capable men, or their fathers wealthy enough to give them some share of their acquired property. On the whole, the variations at present between rich and poor are considerable in a Khasi community, in comparison with that of the Garo, where the economic condition of each household in a village is more or less similar. These differences are not only a matter of economic organization but arise from the nature of each social structure. 178 184 423 428 556 [171]

The economic and social patterns of Sohkynduh and Kongton are very similar, but their dialects are slightly different: my interpreter, who came from Cherrapunje, could work quite well at Sohkynduh, but at Kongton he found some difficulty, especially with the speech of the old men, and with their religious expressions. The head man of Kongton, who was quite accustomed to the Cherra dialect, acted as an interpreter for us. Such differences in dialect in the Khasi Hills are common phenomena; it is said that every valley has its own dialect. Differences are found not only in speaking, but also, to a certain extent, in culture and in social usages. 197 [124]

II. Village Endogamy

One of the outstanding features of Khasi social organization is the predominant tendency of endogamy on the level of the village, which contrasts with the structural orientation of the Garo village exogamy. This is closely connected with the distributions of clans and the nature of the descent groups. 582 621 [171]

The Khasi population consists of a number of *kur*, matrilineal clans, whose members consider themselves to be descended from a common ancestress. The members of the same *kur* have a common 614 [765] [769]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

613 formed independent descent groups by individual households, for
614 which no traceable genealogical relation with any other descent groups
621 could be established, though some of them belonged to the same *kur*. In Sohkynduh, the total 48 households were divided into 16 *kur* (according to the house-owner), and in Kongton, the total 62 households were divided into 9 *kur*, while the number of actual descent groups amount to 31 in Sohkynduh and 41 in Kongton.

166 This fact, I presumed, indicated a considerable mobility of the
178 population of each village community. Hence, I tried my best to
613 reconstruct the historical alignments of these descent groups, both
614 from my genealogical data and with the help of the villagers' memory.
621 The result showed that the mobility of the population over the last fifty years had been surprisingly great and complex. In Sohkynduh, the Praian clan seems to be the oldest inhabitants of this village with 16 *kur* segments. Next came a family of the Ksing. The third wave was a family of Khonglam, and the fourth, Siem Lyngngoh which I mentioned previously (p. 104). The next were families of the Kynshah, many members of which had left for Nonprian village after a few years. The sixth wave was the Srieh family. All the above movements took place before the great earthquake of 1897 which shook Assam. After 1897 the movements became more intense and complicated, and involved many families of various *kur*. The villagers could not remember the order in which they came: there has been continual coming and going even up to now. At present, the Prarian, the Ksing, the Khonglam, the Kynshah and the Dkhar are the older among the 16 *kur*. However, such migrations concern usually a single family only, not a group of *kur*, and that is the typical pattern of Khasi migration. Hence, families which have the same *kur* name do not always indicate the same movements. The incentive for such migration seems to be to get land better appropriated to one's economic condition. Particularly, as I have already mentioned elsewhere (p. 105), the shortage of land seems to encourage families of elder sisters who have no share of property, to move to other areas and look for land.

Thus, many households which make up the present village are minor segments of different *kur*, or of the same *kur*, but they can hardly trace their genealogical relations to one another. A migration to a new village was not undertaken at random; it was mostly as a result of information received from neighbouring villages, or from
178 those where friends or relatives had already settled in. Several neigh-
613 bouring villages usually dispose of more than one common market
614 where they can exchange information and developed friendships over trading. The matrilineal kinship relation is no more important a
621 factor than any of the others mentioned above. Among the Khasi,

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

the matrilineal descent group has a distinguished function only when there is common residence and common property. 178

In Kongton, among 9 different *kur* (List 10), Pohnong and Khonsit accounted for the majority of the population, while the rest, seven *kur*, were more or less of equal size. On the whole the population seemed more stable than that of Sohkynduh. However, as in Sohkynduh, actual descent groups amounted to 41, many of which have the same *kur* name but could not always establish genealogical relationship with one another; nor was there any functional cohesion. I failed to reconstruct the history of the formation of these descent groups: the villagers had no memory of their past except very fragmentary information which was quite insufficient to account for their present composition. They only insisted this was a very old village in comparison with Sohkynduh and other neighbouring villages. 613 614 621 [182]

While I was struggling with the villagers' scant accounts of their past and fragmented kinship relations among the present households, I was struck by the poorness of the villagers' genealogical memory in comparison with that of the Garo. Suppose A, B and C, who belonged to the same property-holding descent group three generations back: A and B being sisters and C being B's daughter. If B, including her descendants, moved away from the village two generations back, the present generation of A's and C's descendants would easily lose contact and knowledge of their genealogical relationship. This fact, on the other hand, illustrates some important aspects of the Khasi social structure: the kinship relation—matrilineal descent link—is not a significant factor beyond the scale of the household (property-holding descent group), and locality is more important than matrilineal descent for the formation of the Khasi community. Through the predominant practice of endogamy on the level of the village, the small segments (found on a level of a household or a group of a few households) of various different *kur* clustered in a village are linked by affinal relations each other, by which altogether form a well knit social organization of a village community. The cohesion and solidarity of the Khasi village community is strengthened by the local endogamy not by the localized lineage organization. 182 613 621

In fact, in contrast with the rather loose kinship relations which link different households, the affinal relations link almost every households in the village, as shown in Fig. 10. The lines, ———, indicate marriage relations between living members of households, and the lines, - - - - -, indicate affinal relations established through dead members of present households or through spouses' kinship relations at Sohkynduh, as in November 1955. In this way, except for one household (24), members of a single household are all linked together through affinal or cognatic ties. In some cases, the affinal relations between 602 621

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

184
some clerical work. However, such instances are very rare in these 582
regions and few Christians are to be found among the people. So far
as my genealogical table accounts for, only two boys from Sohkynduh, 621
and one girl and one boy from Kongton, left for Shillong, and [171]
married there. In contrast to these exceptional cases in these villages, [178]
in the upland Khasi Hills, there are considerable changes in the
composition of a village with high geographical and social mobility
of population because of the spread of Christian education and urban
influence.

The people of the two villages say that marriages with outside 166
people were not formally practised, and were only a recent tendency. 178
However, the composition of the population of the two villages showed
extensive movements of population in the past (not to urban areas, 582
but from village to village). Such movement is attributed mostly to 621
migration by a family rather than by an individual on marriage.
This type of migration is clearly found also in the process of the [184]
formation of Jatinga village (see Appendix, Jatinga).

The composition of the village community and the social character- 582
istics of Sohkynduh and Kongton show very similar features of village
endogamy. They seem to be typical of the traditional pattern of 621
Khasi villages. Village endogamy is the intrinsic pattern among the 184
Khasis. This fact can be also observed to a considerable degree in
Shella and Jatinga.

[P. 116 is blank]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

of marriages between these two *kur*. Such marriage arrangements cannot be regarded as constituting a cross-cousin institution. From my data of four villages it was not possible to produce any institutionalized pattern. 582 614

In general, the selection of a marital partner depends mainly on personal choice, though the authority of the *iing* (descent group) and parents should be consulted. The man proposes to the girl. The network of marriage relations among the Khasi seems in no way to follow any set principle. Every marriage is likely to be fortuitous: it is ruled simply by temporary personal liking, except for the strict rule of exogamy and the avoidance of near kin.

Exogamy is strictly kept. In the olden days breaking this rule was equivalent to being sentenced to death. Offenders had their heads shaved in a particular way and had to leave the Khasi community completely. Even now such a marriage is considered as the worst kind of sin; a Khasi Christian intellectual said to me that it was worse than homicide. I came across one couple who had broken this rule. Though they had different *kur* names, both *kur* were segments of one common *kur*. It happened in Jatinga, one of the most modern Khasi communities whose inhabitants were all Christians. The couple were not allowed to have their house inside the village. Their house was in the jungle about one mile away from the village. 178 582 614 684

Successive sororate marriage—marriage to a younger sister of the late wife—is practised, since it justifies the widower in remaining in the same household as his children after his wife's death. Otherwise, the Khasi rule demands that he should leave the house and his children in order to remarry another woman. We shall deal with this aspect again in terms of marriage. 587

II. Principle of Descent and Succession

Previously I have mentioned the *kpoh*, the matrilineal kin group with a common great grandmother. This is not, however, an institutional corporate descent group. The most important functional descent unit is called *iing*. The *iing* is the lowest order of clan segmentation, smaller than the *kpoh*—a *kpoh* may include two or more *iing*. The generation depth of an *iing* is usually two to four, in some cases an *iing* is formed only by mother and child. The Khasi consider this unit to be the most important social index for the classification of individuals. Marriages are arranged by individual *iing*, not by wider groups of kinsmen. The *iing* is the structurally significant norm. The term *iing* is also used for a house building itself, as is the *ook* of the Garo. However, the membership of the *iing*, as I shall 613

15: Nakane E-5 (1955-1956) 1967 AR? Khasi AR?

592 The Khasi domestic unit (co-residential group) can be divided into four categories:

1. Households consisting of wife, husband and their children, wife's unmarried sisters and brothers—sometimes including widowed or divorced.
2. Households including all members of an *iing* (including their spouses from [613] members of 1). In this type, larger households contain all the descendants of three or more generations from one woman (in this case, an *iing* corresponds to a *kpoh*).
3. Households of intermediate type between 1 and 2. Husbands are supposed [591] to live in their wife's house, but they often go back to their sister's house for meals, and sometimes sleep there. They are supposed to work in their wife's field but they might work in their mother's (sister's) field, if necessary. This tendency is especially strong among newly married couples before they have a child.
4. Households consisting of only one elementary family. This rarely happens when a man married a non-Khasi.

Most Khasi households are of types 1, 3 and 4 and these three types are usually found within one village. They were found in the four villages in which I worked. It is to these dwelling units that I have given the name of house in Lists 6 and 9. Category 2, according to • [178] the information of Khasis and Jaintias, was used to be found among the Jaintias, though nowadays such cases are rapidly decreasing, changing into forms 1, 3 and 4. The members of category 2 belong to an *iing*, which structurally corresponds to the *tarwad* of the Nayar and the *pawi* of the Minangkabau.

178 Category 2 may have been practised among certain of the Khasis
184 a long time ago. Kongton people said that as recently as their father's
591 generation, there were many husbands who stayed at the mother's house after their marriage and visited the wife at night. Nowadays visiting husbands are very unusual cases in the Khasi Hills, though such situations may occur among newly married couples before they have children. Gordon, who wrote his book *The Khasis* in 1914, states:

> "Amongst the Khasis, after one or two children are born, and if a married couple get on well together, the husband frequently removes his wife and family to a house she and her husband post their savings, which are expended for the support of the family" (p. 76).

In the Khasi Hills, the transition period between duolocal residence and neolocal or uxorilocal residence seems to have been shortened during the last forty or fifty years. This might have been effected through the influence of Christian marriages, which start cohabitation of the wife and the husband immediately after the marriage ceremony. However, in Jaitinga where inhabitants originated in the Jaintia Hills where duolocal marriage is the usual practice, there are even now many instances of a man staying at his mother's house for several

years after his marriage. During this period he works in his wife's field, then, if the couple gets on well, they start to live together in an independent house (non-heiress's case) or in the wife's house (heiress's case). In spite of the fact that the inhabitants are all Christians, they have retained this custom.

It is difficult to determine at what date the Khasi people have changed from duolocal marriage to uxorilocal marriage. However, the present dwelling unit, with its fluid relationship between husband and wife (in fact, there are many cases of category 3), suggests a situation linked with the duolocal residence pattern. The fragmentary historical information available and the present Khasi residence pattern suggest that the duolocal arrangement may be an older pattern of marriage. When I was in Kongton there was no husband who stayed at his mother's house permanently, visiting his wife at night. The head man told me that, when he married, there were many who did not stay in the wife's house. He was the first person to settle in the wife's house. In his case, he said, he felt sympathy for his wife who had no brother who could work for her. After he had settled in his wife's house, many villagers began to follow his example.[1] When the pattern of a visiting marriage was in vogue, a village must have constituted a more compact endogamous unit. If the husband's house was in another village, a visiting marriage must have been a great inconvenience. The tendency to settle in the wife's house and work for the wife's house must have brought about a wider range of marriage contracts, such as with members of nearby villages, even though in the present form of marriage, village endogamy is much preferred as it is decidedly advantageous particularly for a husband, since he can continue his life in the same familiar environment in spite of uxorilocal marriage.

The variations in the pattern of co-residential grouping, which I have classified into four categories, reflect two different themes in the social structure of the Khasi. On the one hand they represent different stages in the maturity of the individual families concerned. For example, a householder who starts in category 3 or 4 may end up an old man in category 1. On the other hand these variations also reflect the polar opposition between the obligations of matrilineal kinship and the obligations of parenthood; a man, in particular, has conflicting obligations towards the ring of his sister and the ring of

1. However, all the information which I collected in the upland Khasi villages indicates that the uxorilocal residence pattern has been practised for a long time. According to stories often told by the Kongton people, they migrated from the Jaintia Hills. If these accounts are to be taken as a reflection of the real history of their migration, it would seem that the Kongton people may have kept up the Jaintia custom including the duolocal residence pattern up to recent times, while the majority of the Khasi practised uxorilocal marriage.

15: Nakano E-5 (1955-1956) 1967 AR7 Khasi AR7

Thus, the marriage of a non-heiress and a man of authority also produces an unstable position for the husband in spite of his having an independent household. Therefore, the possibility of a really stable marriage is even more limited; it will occur only in the match of a non-heiress and a non-authority of the *sing*. But even these marriages cannot be free from the influence of a matrilineal social structure: the man of authority of the wife's *sing* may visit these couples now and then, curb the husband's power and remind both partners of the orientation towards the matri-kin, the *sing*, though this pressure is insignificant in comparison with that experienced by the heiress's family. Likewise, a husband now and then visits his youngest sister's house, the *sing* one. These constant matrilineal contacts offer husbands chances of escaping from even the slightest matrimonial tension. Whenever a Khasi man feels uneasiness, he will return to his sister's house rather than face a difficult situation with his wife. This tendency is maximized especially on the occasion of religious ceremonies, when all individuals are grouped around each *sing*.

It is apparent that the rules of the *sing* as the underlying structural pattern, function throughout the various categories of domestic unit of the Khasi community as the most important intrinsic force.

VII. Polygyny

After this long attempt at the structural analysis of marriages, I think one can theoretically predict what is the situation of polygyny among the Khasi. The theoretical framework elaborated through preceding discussions can also be tested by the empirical data in terms of polygyny.

Nowadays, the Khasi feel so strongly against polygyny that they have no knowledge even that they ever practised it. Many Khasi, in more sophisticated areas, did not believe my findings on polygyny in Sohkhymsiah and Kongkan. I think this is due to the rapid Christianization of the Hills during the last hundred years. My interpreter, though he was not Christian, said to me in the village, "it is most regrettable to bring you to a village where we find polygyny." However, one of the ministers of the Chaura State to which the two villages belong, told me that there was no particular opposition to polygyny, though recent Christian influence gave people the idea that it was a shameful custom, and he mentioned the case of a polygynist in his own, a man who had recently died, who had had ten wives. In Jaitinga whose inhabitants are all Christian, and in Sielia where there has been much contact with, and influence by, Hindus, there were

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

118 no polygynists, though there were many personal temporary illicit
184 relations or love affairs.

It is true that even in interior villages polygyny is rapidly decreas-
595 ing. In the two villages I found only two cases of polygyny: a man with two wives in Sohkyndah (Josio in List 6, whose wives are 26 and 32), and a man with three wives in Kongton (Jubongrai in List 9, whose wives are 8, 20 and 52). These cases appeared clearly as cases of polygyny which the villagers recognized as such, speaking of them quite differently from the way they would have spoken of lovers, calling them wives and husbands. Of course, the first wife socially outranks the secondary wives, as *ka tynga iwai*, and the term *ka tynga tuk* is used for the latter, as Gordon states (1914, p. 80). The difference being that the first wife has a legal marriage ceremony while the others have not—*ka tynga tuk* means literally 'stolen wife.' About
585 the marriage ceremony, Gordon gives a detailed discription (*ibid.*,
595 pp. 127-130) and says there are three forms of marriage ceremonies, *Pynkiarynjat*, *Lamdok* and *Iadik-kiad*. The first and second forms are considered the more respectable; the last one is resorted to by the very poor who cannot afford the greater expense entailed by the first two. Unfortunately, during my stay in these villages, no marriage ceremony took place, but villagers described to me what seems to be the *Iadik-kiad*, where only a fowl is sacrified, and the whole procedure is much simpler than that described by Gordon. However, whatever the complexity and richness may be, there is a distinct line between having a ceremony and not having it, and this draws the distinction between the status of the first wife and that of the secondary wives.

428 Nevertheless, this distinction has more of a social bearing than the
595 legal bearing it has in a patrilineal system. Since they follow the
851 matrilineal system, the legal distinction between the first wife and the secondary wife does not affect their children's status and their property rights, at least not in the villages where I worked. The children's social horse is determined by their mother. The children (particularly the youngest daughter) have the right to inherit their father's acquired property which is automatically under their mother's ownership. If the polygynist father has acquired property by working their mother's field, or in trading on behalf of their mother, whether she be the first wife or the second, this property undoubtedly belongs to the children of that wife, not to the first wife alone. The father's physical horse at the time of his economic realisations is the decisive factor.

591 The Khasi polygynist, without bringing his wives into one house-
595 hold, alternates his residence among them, in turn or according to his temper. This practice is similar to that of the Trobriaw described by Goodenough (1956, p. 103), and quite different from that of the Garo

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

[Shella]

621 (7) Mawronghong, (8) Rymsong-kanor, and (9) Sholap, as shown in Map 9.
103 In Shella village the number of households in each section ranges between 10 and 80. Such a section is called *kaw*, and was supposed to be the site of house-
614 holds of segments of every *kur* (clan). It seems that Shella village was once
621 composed of nine different *kur* which could intermarry with each other. However, nowadays, each section, as appeared in my census, has nothing to do with the
• 178 *kur* as such; it is simply a geographical section. According to the information which I gathered, there had been a tendency for the same *kur* people to gather
731 within the section, before the great earthquake in 1897 brought considerable

[102]

MAP 9. — *Distribution of Sections in Shella Village.*

damage and death to this area: many of them left the village at the time and many houses changed their sites in the village when they were reconstructed. For instance, the composition of Jaair section in January 1956 was as follows:

614
621

Name of kur	Number of houses	Name of kur	Number of houses
1. Yuchyne	7	9. Lyngkhi	1
2. Jaiaai	4	10. Riang	1
3. Lawit	4	11. Nongthiang	1
4. Synnon	3	12. Lohi	1
5. Kmiong	3	13. Kanto	1
6. Nongkai	3	14. Kanti	1
7. Sawr	2	15. Khelwa ?	1
8. Jaiaai	2	16. ?	3
		Total	40

178 The people said that in Jaair, the Yuchyne was the most influential *kur*,
621 and must have been the original *kur* in this section. However, no clan solidarity could be observed. These seven households were socially and economically
614 quite independent of each other, as are all other households. As a whole, the importance of *kur* diminished a great deal in this village. Five households in Jaair were reluctant to mention their *kur*; some of them did not care about their *kur*; others were not themselves certain to which *kur* they belonged. The *kur* is losing its function to a great extent. This can be ascribed to the high degree of sophistication and mobility. However, except for one Siem woman who came from the uplands and married a man of this village, all 15 *kur* mentioned above are local clans frequently found within the Shella Confederacy. In
621 this area also community endogamy was predominant. Perhaps the Shella

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Shella
Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards along the steep slope, looking down towards the Bengal plain. The climate of this part of the hills is considered to be one of the worst in tropical India for human habitation. The Bengal plain, though warmer than this area, is considered more healthy. This border land is the zone of malaria, typhoid, black fever, cholera, etc. None of the Bengalee peasants dare to live in such an area. However, it is the most fertile for products such as betel-nuts, pan-leaves, oranges, bananas and pineapples, and it also produces limestone. These people seem to prefer to settle in this zone and to enjoy its prosperity, at the expense of human lives: every year, especially between March and September, the inhabitants suffer from various fevers and dysentry and other diseases, many of the weaker facing death. 131 132 164 433 164 648

Before the Partition of India and Pakistan, the products of Shella were carried down the Shella River to Sylhet, one of the biggest centres in East Bengal, which brought unimaginable wealth to the Shella people. Their houses were built by carpenters from Sylhet. The style and structure of these houses were exceptionally elaborate for the Khasi. They purchased vast rice fields in the plain, which used to be cultivated by Bengalee and Garo labourers engaged by them. These Khasi do not themselves know how to cultivate rice fields; they have always been managers or landowners. Their boys used to be sent to high schools and colleges in Sylhet. As a result of their trading with the Bengalee, many of them read and speak fluent Bengalee. There is no difference between their style of clothing and that of the Bengalee, though the women maintain their traditional dress in the Shella style. 177 178 434 [434] [342] [166] [464] [97] [191] [291]

They have thus been distinguished from the rest of the Khasi not only geographically, but also economically and culturally. Their personality also differs sharply from the rest of the Khasi. They are very sociable, and quick, a quality lacking among the Khasi of Sohkyndah and Kongkon. They are clever enough to deal with strangers. The upland Khasi say Shella people are very cunning. This remark shows one side of these people. They had to be cunning, since they traded with the Sylhet Bengalee who were said to be the most cunning of their race. Their role in the trade and in the history of the modernization of the Hills was considerable. For centuries they represented intellectual Khasi owing to their contact with Hindu civilization, while the Hills remained in darkness. They assumed an important role when the British established an administration in the Hills, and even up to now, many leading Khasi originated from this area: for instance, Lalli Hat, the first interpreter of the British Headquarters at Cherrapunjee; Jaobon Roy, who was the first Magistrate among the Khasi; Mohum Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jaobon Roy); Nicholas Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nicholas Roy), Principal of the Gauhati University, etc. 157 184 648 177 176 [439]

Through constant cultural contact with Hindu, and encouraged by their economic prosperity, the Shella Khasi, like the Jaintias, have been much influenced by Hindu culture. However, this does not mean that the people of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, and some ceremonial elements were borrowed from the Hindu, most of the 177 648 771 795

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

621 descent grouping are often different. This is a very similar pattern to the
[184] mobility which I discussed in Sohkynduh and Kongton (see p. 112).

One of the outstanding features in this community is the strong paternal
• 178 authority, established especially in the first generation, because the father's (husband's) contribution was very important in such circumstances: their
593 domestic units were completely independent from the *iing* either of husband or wife. Some of them came with their wives, and many younger ones and
61 their sons brought their wives from their homeland afterwards, thus practising
621 virilocal marriage.

They have an interesting social usage which reflects the importance of the husband of the first generation. This is the addition of the name of the husband of the first generation to the matrilineal clan name in order to differentiate each particular descent group established at Jatinga within the same clan. For instance, Rupsi-Tah, Rupsi-Loh, Rupsi-Khla and Rupsi-Lati are found in the Rupsi clan. Rupsi-Tah is one of the lines of the first immigrants to Jatinga, which I have mentioned as Rupsi: Tah was taken from Pryntah, the husband of Sinta (Rupsi) (see p. 171). Thus the present inhabitants of Jatinga are very conscious of their father or grandfather, though they strictly follow the matrilineal descent rule. From such a usage of naming a clan, the Indian officer, who gave me some information about Jatinga before I went there, made the mistaken deduction that they had changed from matrilineal to patrilineal, assuming this to have come about as a result of the influence of patrilineal tribes around Jatinga. But this is simply due to the fact, firstly, that they hold in high regard the man of the first generation, because of his great contribution; secondly, that they distinguish themselves from members of the same clan according to the descent group established at each immigration; in other words, it indicates each *iing* grouping in the village.

178 The fundamental Khasi social organization based on the matrilineal system
184 did not change at all. I could observe in Jatinga exactly the same principle in action as I had found in Sohkynduh and Kongton. The village endogamy
582 has also been well established in the present generation: there are about 20 different clans which can intermarry, and taking a spouse from an outside com-
61 munity has become very rare nowadays. Marriage patterns in relation to the
621 *iing* structure and all its related aspects are surprisingly similar to that of the communities in the Khasi Hills. The solidarity of the *iing* is even greater in Jatinga, particularly among the rich, because of the greater accumulation of wealth and greater economic activity, which also increases the authority of the *iing* as manager of considerable property—this was also the case with the Shella people. Jatinga demonstrates that in spite of colonization and of a significant change in economic activities, Khasi social organization has maintained itself intact. This situation is in contrast with the considerable social changes observed among the Garo community in colonial areas like Rimibara and Jodhipara.

621 *Intermarriage.*

178 From the earliest period of the establishment of Jatinga up to the present,
582 some changing aspects of marriage patterns relating to intermarriages are to be observed.

563 As I stated before, in the earlier period, the people used to bring their spouses from their homeland, but they also married neighbouring tribal peoples, namely,
563 the *Zemi*-Naga, the Kuki and the Cachareo of villages close to Jatinga, and
621 also the Lushai, the Bengalee, the Moslem and the Anglo-Indian who lived in Haflong, the biggest political and commercial centre in the Hills, situated

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

[Jatinga]

three miles away from Jatinga. As one may expect in such a situation, quite a number of intermarriages with these peoples appear in my census of Jatinga. The resultant of these intermarriages was that when the couple and their children lived in Jatinga, they were considered to have become Khasi; otherwise they were held to be non-Khasi, whether the spouse was man or woman. This orientation of social recognition of the result of intermarriage was generally seen among Khasi in such situations, not only in the case of Jatinga. 563 621

The following are extracts of intermarriages from my genealogical table of Jatinga people. 563 591 621

A. Cases of intermarriages in which the descendants became Khasi.

1. A woman of the Dome clan married a Kuki man. All members of the present Dome clan at Jatinga are their descendants.
2. A woman of the Rymbai clan married a Kuki man as her second marriage. Their descendants are Rymbai.
3. A man of the Suchiang clan married a Mikir woman, and lived in Jatinga. They had one daughter who married a man of the Hua clan of Jatinga. They named this woman's line 'Shadap' as one of the Khasi clans. Later this Mikir woman's sister's daughter married a man of Rupsi-Lati, and their descendants were also named 'Shadap' by the villagers. Thus Shadap clan was created by a Mikir woman who married a Khasi man of Jatinga.
4. A Khasi man married a Lushai woman and lived at Aijal, the headquarters of the Lushai Hills. They said he became Lushai. Later a man of the Pajat clan of Jatinga married his daughter from Aijal. This couple lives at Jatinga and has several children. The villagers said they have to give them a new clan name. It is under consideration.

B. Cases of intermarriages leading to the emigration of Jatinga inhabitants.

5. A man of Jatinga married a woman of Zemi-Naga as his second marriage and lives at his wife's village.
6. A woman (the daughter of the woman of Rymbai, who married a Kuki: A-2) married a Moslem man and lives at Haflong.
7. A woman of Rymbai married a Panjabee and lives at Shillong. This woman is (B-6)'s mother's sister's daughter.
8. A woman of Siangbai clan married an Assamese and lives at Gauhati.
9. A woman of Rupsi-Tah married an Anglo-Indian and has gone to the United Provinces.
10. A woman of Jatinga married a man of Zemi-Naga and went to his village.
11. A woman of Jatinga married a man of Cacharee and lived at his village some time, but she came back to Jatinga after divorcing him.

A cases belong to the earlier period when Jatinga had a shortage of population, while *B* cases, except 10 and 11, are found among the present younger generation. The population, which had increased rapidly in the last twenty years with economic prosperity, is suffering from the recent economic depression caused by the Partition as well as from the great damages done to their orange gardens and pan-leaf gardens by tree diseases. Moreover they have an unbalanced rate of birth according to sex: females are more numerous than males. Therefore, many daughters marry out as shown in the cases of *B*. The above-cited cases are only concerned with intermarriages with non-Khasi, but there are still other women who married Khasi men and who reside outside Jatinga, as for example, at Haflong and Shillong. [161]

In the village there are still many unmarried girls without suitable spouses. In the olden days, it was less difficult to marry neighbouring tribal peoples. 178 563 621

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

178 like the Zemi-Naga, the Cacharee and the Kuki. But after the period of
563 economic prosperity as I shall describe in the next section, the Jatinga people
621 reached a rather high level of education, while most of the neighbouring tribes
[871] remained illiterate. Their standard of living likewise improved. Fashionable girls of Jatinga who have studied at the Convent school in Shillong, and speak English and Hindi, cannot marry half-naked tribesmen who work in the jungle. They prefer to intermarry with Moslem, Panjabee or Assamese who belong to amore sophisticated community, and through whom they can enjoy urban life. Thus the orientation of the intermarriage of the people of Jatinga has changed, along with the growth of Jatinga.

It should be noted that intermarriages came mostly through the contacts at Haflong, where people used to go once a week for the bazaar, rather than through direct contacts with neighbouring villages.

Economy of Jatinga and its Relation to Neighbouring Tribes.

178 It is very interesting to find two different kinds of economy in the same
171 ecological background: Jatinga Khasi practise pan-leaf and orange cultivation
245 and depend mainly on a trading economy, while the other neighbouring tribal peoples practise jhum cultivation, almost a subsistence economy. This situation has remained unchanged for the last fifty years since the establishment of Jatinga village.

The first Jatinga immigrants occupied one ridge of the mountain where the
101 present Jatinga is situated. Formerly, this land belonged to the Zemi-Naga,
245 one of the old inhabitants of the Cachar Hills, who possessed a vast jungle area for jhum cultivation. It seems that there was no objection to the Khasi occupying this small spot: it was apparently too small an area for the jhum cultivator —pan-leaf cultivation of the Khasi requires less than one twentieth of the land of the usual jhum cultivation. The Khasi who started pan-leaf cultivation were able to accumulate some capital, and after several years they started orange gardens. They had had experience of orange cultivation in their homeland, but this was the first time they had operated commercially.

245 The success of this orange cultivation was beyond their dreams. Hearing
434 of good oranges at Jatinga, many Bengalee merchants from Dacca, Sylhet,
439 Silchar and Gauhati began to come to buy them. Moreover, the village had
[496] the great advantage of being situated near the railway station. Oranges were sold by carloads. Unimaginable wealth came to the Jatinga people. Especially the founder's family, including his brother's and sister's, became extraordinarily wealthy; their income used to be Rs. 20,000 a year. The children
[871] were sent to the school which was established in the village and some were educated at colleges in Dacca, Sylhet and Shillong. The villagers had
[362] beautiful houses built by Manipuri and Bengalee carpenters. Actually the houses of Jatinga were known as some of the best construction in Assam.

Like the Shella people, they were managers of gardens and employed workers.
245 Wealthy households used to engage several labourers annually, most of them
46 from Jaintia where the Jatinga people had originated. These workers were provided with shelter in the servant quarters of their employer's house, but they had to provide meals for themselves. They were paid daily according to the work done. They were available to other households, when their employer had no work. Some labourers were also engaged locally among the Zemi-Naga, the Cacharee and the Kuki, though not as many as among the Jaintia.
245 These local tribes were fairly well occupied by their jhum cultivation, and not
464 used to being employed as workers. Therefore, most of them were not regular

pendable water supply. Villages are about two to five miles apart, and have no boundary markers. In the past, villages contained semipublic buildings and grounds: the home of the village priest (also the home of a chief if he resided in that village), the village marketplace, and tree groves, cremation grounds, or other awesome spots that were believed to be inhabited by supernatural beings. Villages today may have also one or more Christian churches, government social welfare buildings, and schools. Formerly, villages were entered through a guarded gateway; this is no longer the case, and paths feed into villages from all directions. Often several villages are nucleated into one large unit, named and also described as a "village." These were once defense units, but were so uncohesive otherwise that institutionalized rivalry obtained among the component villages. Now, they have been integrated through the agency of all-village public services, especially schools. **Housing.** The traditional Khasi house is entered through a door at the rounded end of a U-shaped ground plan, and is about 20 feet at widest extent; it is about 30 feet deep, and is elliptical or hogback in profile. Its walls are of stone blocks cemented with mud. The roof of grass thatch, supported by a bamboo frame, overhangs the walls on their outside, down to about three feet above the ground. The house is divided into two parts: the front one-third is on the ground level, floored either with stone blocks or tamped earth, and is used for storage of occupational instruments and as a shelter for poultry. The rear two-thirds is raised four feet on piles of stone blocks to a platform of planks, and is partitioned into six rooms, comprising a kitchen, areas for storage of food and water, and sleeping quarters. Furniture is minimal, and the house is totally undecorated. There are no windows, and no smoke vents. A house generally has a companion shed, walled of wood and grass matting and thatched with grass. This serves as a pigsty, but it may be partitioned also to house cows, and it may have a loft for fuel storage. Compounds often contain garden plots, and are fenced around with stone or bamboo and mud. Nowadays, the traditional house has given way to Western-style bungalows of wood and tin, especially in and around Shillong. [Cf. Mukherjee et al. 1941.]

ECONOMY. The Khasi economy is a market economy based on agriculture, and most Khasis are primary producers, sellers, middlemen, and/or providers of services in connection with markets. Khasis are often multioccupational: they produce goods for partial subsistence, and also play some part in trade. **Agriculture.** On the Shillong plateau, the major field crops are potatoes, maize, millets, and dry rice, still produced mostly through swidden farming, with a two- to three-year period of fallow, but increasingly through continuous use of a single field with the aid of ma-

241 433 443 [463] 241

[P. 1084] AR7 Khasi AR7

nure and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Bhoi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Bhoi country are paddy rice, lac, caoutchouc, cotton, bananas, and pineapples; in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stegmiller 1925.] **Gathering.** Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsboy during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are portable, except for hunting dog. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chikas. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shawls, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stegmüller 1924a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

clothing, operate the large Khasi business establishments in Shillong, and provide all civic and religious leadership. Women care for children and for the home, do the marketing, and sell dried fish, betel nut, lime, fruits, and rice breads at markets. Other tasks can be performed by either sex. **Land tenure.** Land was formerly divided into sib land and public domain. Sib land was corporately held in perpetuity, and was inalienable except by the unanimous consent of all members of the sib. The public domain was subject to usufructuary right by anyone who kept the land regularly under habitation or cultivation, with a lapse of no more than three years. Most villages grew up on public domain, and then reckoned all land inhabited or under cultivation by a village member as village land. Forests were public, except for sacred groves possessed by villages or lineage groups, and everyone was free to gather branches for fuel. Wastelands and streams were also public. By now, most public domain and village land, together with its forest cover, has been pre-empted as private property and is being rented and sold as such. Sib lands remain intact, unless the sibs agree to rent, lease, or sell. [Cf. Cantlie 1934.]

462 294 443 622 423 [178]

KIN GROUPS. **Descent.** Descent is matrilineal, and the Khasi is a member exclusively of his own matrilineage from birth to death. Adoption, which is very rare, is only within the matrilineage. **Kin groups.** The maximal matrilineage is the sib; this is a named, widely dispersed, strictly exogamous, lineage group, which claims but cannot trace its origin from a single ancestress. Sibs used to meet as corporate groups from time to time. Some sibs are linked with others in large amorphous groups that are unnamed and are defined solely by exogamy. Such a group is composed of two or more sibs, the ancestresses of which are claimed to have been either real sisters or dear friends who out of affection declared that thenceforth their descendants would be as consanguineals. The origin and function of sib-linkage is now unknown, and today the members of a sib will often disagree on whether or not their sib is linked with another. • The minimal matrilineage is the local descent group, or *ing*. This is the largest kin group that normally rallies at life crises. It is said that the *ing* formerly spanned six generations; today, it encompasses only four. If an *ing* grows to more than four generations in a single village, it segments. New houses are located at some distance from the old and the *ing* soon forgets exactly how to trace genealogical connection, except for which segment descended from a youngest sister. The term *ing* may also be applied to an extended family, an elementary family, and a house. The elementary family is the basic domestic unit in Khasi society. In any village there are likely to be one or two households which stand as sole local representatives of the lineage of the female household head. Such a household is known as an

611 [597] 614 602 [59]

ing from the time it consists of an elementary family 602
until it grows to a local descent group four generations deep. [Cf. Chattopadhyay 1941.] **Kin terminology.** The terms of address given below are also 601
terms of reference except where otherwise indicated, and are uniform for male and female speakers. They were collected in an upland Khasi village near Shillong (cf. Ehrenfels 1953 for some regional variants). [114]

MARRIAGE AND FAMILY. **Mode.** According to 584
the traditional courtship pattern, a group of young male relatives and friends made nightly visits to the house of some virgin girl in another village, appraising her through banter while she and her parents appraised them, and staying the night to avoid the dark walk home. Marriage was according to the wishes of the parents after negotiation by a go-between from the boy's side. Girls might be 15, and 582
boys 17, years of age. Girls have now acquired free- 564
dom of movement through attending school, how- 178
ever. Premarital sexual play is common, and young 836
people choose their own spouses when the girl is 584
about 19 and the boy 21. The most common mode 583
of marriage is elopement, for Christians and non- 585
Christians alike, but some Christians marry in church, 184
and some Khasis still marry according to the tradi- 583
tional ceremony or some variation on it. There are
no preferred or prescribed marriage types, nor is 581
there a bride price or dowry. **Form.** Monogamy is 835
the ideal for all. **Extension of incest taboos.** Sibs are
exogamous. Other prohibited marriage partners are
real and classificatory FaSi and FaBr, FaBrCh, FaMo, [114]
and FaMoMo. The MoBrWi is also prohibited. Boy

says that the MoBrCh but not the FaSiCh is prohibited (1897: 2), but Gurdon says that the MoBrCh is eligible after the death of MoBr, and that FaSiCh is eligible after the death of Fa (1907: 78). Nowadays both types of marriage occur, whether the linking relative is living or dead. **Residence.** Residence is either duolocal or matrilocal under the roof of the wife's mother until the birth of one or two children. For a man married to a youngest daughter, it then continues to be matrilocal. For men married to other daughters, it becomes uxorilocal; there have also always been cases of virilocal residence, and it is now common to find neolocal residence in Shillong. For non-Christian Jaintias, it is duolocal throughout the marriage. **Domestic unit.** The domestic unit is the elementary family, though for a youngest daughter it may temporarily include also her aged mother, aged father, unmarried siblings, or divorced or widowed brothers. **Inheritance.** Traditionally, after the Khasi mother had helped each of her daughters to build and supply a house when each one married and had children, her only real obligation to help them economically was ended. Everything she possessed, excepting certain personalty that was destroyed in her cremation, was inherited by her youngest daughter. Failing daughters, a woman's property reverted to her next youngest sister's daughter. Today, this pattern is often modified by putting more property into the hands of older daughters and even sons. [Cf. Cantlie 1934; Becker 1924.] **Divorce.** A woman may effect numerous and usually brief separations from her husband by simply closing the door of her house to him, whereupon he returns to the house of his mother or youngest sister. Divorce, however, must be initiated by mutual consent. Divorce is very common, even though women resist it because they do not wish to lose a provider, and men because they do not wish to lose their children. Formerly it was accomplished by a simple ritual in the presence of witnesses, followed by public announcement by a town crier. Now, the witnesses and the public announcement have been dispensed with, and evidence for divorce consists only in the word of the parties concerned.

835 [114] [178] 591 592 428 [178] 586 586 178

SOCIOPOLITICAL ORGANIZATION. **Political organization.** The basic unit of political organization is the village, which is composed of one or more dominant local descent groups plus several others. Village government is by an assembly of all resident adult males, under the informal chairmanship of a headman elected by them from among their number. The membership of any immigrant household into a village is defined by the participation of the household's males in this assembly. Sustained membership in a village is voluntary. Khasi chiefdoms probably arose out of voluntary associations of villages, which occasionally transferred allegiance from one chief to another.

62 174 619

another. In other words, a state is not a fixed territorial entity. In the early twentieth century, the most populous of the 25 chiefdoms, Khyrim, contained 36,833 persons occupying 7,859 houses in 372 villages, and the least populous, Nongkwai, contained 246 persons occupying 53 houses in 3 villages. Fifteen of the chiefdoms were headed by a *syiem* (chief); three by a *lyngdoh* (priest), six by a *sirdar*, and one by a *wahadadar*. These leaders all had executive and judicial functions, but a chief's authority was limited in that he had to obtain the approval of his executive council before acting. The other leaders were subject to a similar limitation. A chief maintained a small police force. His major sources of revenue were market tolls, fines, and, more recently, income from licenses to distill rice whisky. Succession to a ruling role in the larger states traditionally involved election by members of a lineage that had a hereditary right to elect, from among members of a lineage that had the hereditary right to rule. In British times, the elective basis was broadened, differentially in the various states, even to the point of popular elections. [Cf. Aitchison 1931; Lyngdoh 1962.] Social stratification. The three classes of lineage are the nobles, the commoners, and the slaves or servants. This stratification applies only to the recruitment to office in the native-state system, for there is no hypergamy, and in a village assembly everyone has equal voice. The noble lineages have the hereditary right to fill from among their male members roles such as village or state priest, councilor to a chief, or elector of a chief. The few lineages which today are remembered as slave or servant lineages had the inherited obligation to render special services to a chief's household. There is no Khasi term for "commoner." Every lineage other than a noble or a slave lineage is a commoner lineage, and the commoner lineages are in the majority. Warfare. Warfare was suppressed by the British, and little is known for certain about its traditional forms. The tactics which confronted the British were the ambush and the guerrilla raid. Traditional goals included taking heads from other Khasis and capturing women from the valleys.

RELIGION. Major and indigenous religions. A Welsh Calvinistic Methodist missionary penetrated into Cherrapunji in 1832, and the work that he began continues to this day. His society, which has since become the Welsh Presbyterian Foreign Mission, introduced writing, village primary schools, a high school, a theological seminary, and a hospital. Competing missionaries followed, and by 1914 some Shillong Khasis were puzzling over the tenets not only of traditional Hinduism and Islam but also of the Buddhists, Brahmo Samaj, Arya Samaj, and Unitarians (Roy 1914). By the 1920s, missionaries of the Church of God and the Seventh Day Adventists were

household deities, and measles and smallpox deities. 776
Deities of the first two categories are simply aspects 771
of the high God or Goddess. • The earth is peopled with two great orders of land demons and water demons who cause all undesirable, unnatural, and otherwise inexplicable events, acting either on their own or as instruments in the hands of sorcerers. Apart from omens, both in nature and in dreams, 787
Khasis attach supernatural significance also to mystic 822
numbers, and to the colors white, black, and red. They hold especially important folk beliefs regarding 824
betel nut, paddy rice, gold and silver, and clothing.

Practitioners. The two classes of religious practitioners are the village or state priests and the sacrificers. 791
Both are male. They use the same divinatory tech- 793
niques of reading broken eggshells and the entrails 764
of cocks, and they both sacrifice cocks, hens, goats, pigs, and cattle. Their skills are not taught to them so much as picked up by observation and confirmed by demonstrations of efficacy. A priest is elected from among the men of his sib to direct his skills to the public good until he dies, and his rewards are institutionalized and come from the village or the state. A sacrificer acts for private persons or his groups, on call, and is rewarded by them personally with gifts in cash or in kind. The sacrificer is called upon to explain and then to ritually remedy every variety of misfortune, especially illness, though his powers are nowadays regarded with ambivalence, and he is widely expected to become a sorcerer sooner or later. • There are two major types of sor- 754
cerer. One is the ritual specialist or sacrificer who secretly turns his skills from good to evil, manipulating demons to injure a person or his group, and acting always for himself alone out of considerations of jealousy or revenge. The other is normally a leading citizen, a woman who is so wealthy and successful that it is believed that she must keep a thlaw, i.e. a creature which will bring her prosperity so long as she feeds it periodically with human blood. To provide this blood, the men of her household, or other males whom she bewitches with a special whisky, will indiscriminately murder anyone except a mem- [184]
ber of her matrilineage. The Jaintias have an analogue to the thlaw in their tiwi, except that the ultimate result is death from illness rather than murder. Minor witchcraft can be perpetrated by poisons keepers or persons with an evil eye, who are often women. Ceremonies. The important traditional 845
ceremonies were the life-crisis rituals relating to 846
pregnancy and childbirth, the naming of a child, and 847
death. Lesser ceremonies related to marriage and 848
divorce, and to housebuilding. All these rituals were 849
addressed primarily to the ancestors, and they are 850
still performed in modified form by many Khasis. 851
Other rituals, which were performed by groups such 852
as villages, sibs, local descent groups, or households, 1780 •
were addressed to the unnamed aspects of the high 782

16: McCormack E-4,5 (1956-1958) 1964
[P. 112 A] AR7 Khasi AR7

God or Goddess, deities regarded as helpful in bringing prosperity, producing fertility, and so on. Rituals of this kind are no longer practiced, except for the Bedinghkhum ceremony designed to protect the Jaintia village of Jowai. Finally, the state religion of many chiefdoms was expressed in one great ceremony per year which was intended to secure ancestral blessing for a chief and his lineage, and, through this, for the entire chiefdom. The notable example, still practiced, is the Pomblang Syiem of Khyrim chiefdom. [Cf. Lyngdoh 1937, 1940, Stagneliur 1950b, Becker 1956.] **Illness and medicine.** In time of illness, a Khasi calls in a sacrificer, and possibly also a medicine man. The medicine man is an ordinary individual who has hit upon some herbal remedy for one or more ailments, who has become famous enough to be sought out and rewarded in cash, and who jealously guards the formula of his medicine until it dies with him. He and his patients tend to regard him as specially blessed. **Soul, death, and afterlife.** The universe is comprised of a heaven, the earth, and the air between. Heaven is where the souls of deceased mortals live in eternal peace, grouped ski by ski. The earth and all nature were created by God, and everything that God created has its own individual soul. There is no other great earth deity, for it was God who created the earth. The air is inhabited by the wandering souls of those dead for whom full death rites were not performed. A Khasi's potentiality for enjoying an afterlife in heaven with his ancestors depends on his receiving proper death rites at the hands of his ski mates. First, his body is cremated by his children, notably his youngest daughter, and his bones are collected and deposited temporarily in a small stone receptacle. All work stops in the village while everyone participates in the funeral. Once every several years, an entire ski gathers to witness the transfer of the bones of recently deceased ski mates from their temporary receptacles to the great ski cairn that is in the keeping of the youngest daughter, descended from the ski ancestress through a line of youngest daughters. This final ceremony covers five days, and is elaborate and expensive, but when an individual's bones are finally resting with those of his antecedents in the cairn, it is understood that his soul is finally in heaven, "resting hand out in the house of God."

clans were very much as we find them at the present day among the Naga and Kukis, beyond and bordering our present extreme limits, viz. that of constant feud. They are now the quietest, most peaceful, and contented of all the hill people on the eastern frontier. [178]

In my former paper I did not allude to the cairns in these hills, which I am inclined to think are works of greater age than the stone structures. The custom is one that certainly has long since been given up, for I could not obtain any satisfactory account of them. They are only to be seen on the southern side of the Khasi plateau, and Dr. Hooker, in his account of his trips to the Kollong Rock, did not fail to notice them. About Mairang and towards Nongstoin they are very numerous, and always stand on commanding situations. On the path leading down the grassy spur to the stone monuments previously described, near Nongkhi, is a very fine large example of a cairn, about eight feet high. They are usually plain hemispherical mounds of earth; but this one is faced all round at the base with slabs of stone about four feet high; they are frequently not higher than six feet. A distant view is shown in Plate iii. 172 [03]

Nowhere is there any trace of the earth that forms them having been excavated close by; it must, therefore, have been carried in some short distance, to avoid unsightly hollows near the structure. I should much like to have dug into one of these cairns, but was afraid to hurt the feelings of the people by doing so. They are very probably cinerarias of an earlier form to those now made of stone, and this point it might be interesting to clear up.

Beyond the Khasi area no cairns are to be found, at least I had never come across any until visiting North Manipur last winter (1872—73), where, at the head of the Imphal river, on the direct road from Sonagoting, are four fine cairns, all faced with large boulders. They are old, and the Naga now living in the village near said they had been made by another clan of Naga, who long ago had gone farther north, and the site of whose village had been lately re-occupied by Kukis. [114] [101]

Mr. C. B. Clarke, in a paper read lately before your Institute, refers to the different forms of the cinerary in the Khasi Hills; but he has not quite exhausted the subject, or got farther than I did, although with regard to the disposal of the ashes of the dead he gives some further interesting particulars. [114]

As I think that drawings are of very great interest, and better exhibit the many different forms of bone depository or cinerary that have been adopted at different periods by tribes inhabiting localities very far apart, and often quite unconnected ethnically, [126] [164]

19: Assam C-5 (1958) 1963 A87 Khasi A87

3.3 **Measures so far taken.**—Since 1947, there has been constant demand from border people for relief and rehabilitation. Government undertook various measures to alleviate their difficulties. Government's attention to border problem has however, not been adequate. The common feeling of border people was that whenever the border problem deteriorated due to some adverse measures adopted by East Pakistan authorities more attention was attracted, on the other hand, when the situation eased comparatively the Government's vigilance also slackened. 649 659

The various measures so far adopted by Government in border area, have been fully discussed and commented upon by the Border Rehabilitation Committee. These need no repetition here. But a few points emerging from the grievances put forward by the villagers during our investigation are noted below.

On the question of the schemes linked up with the issue of diversification of agriculture in border area, a large section of the border people skilled in the maintenance and operation of orchards are opposed to the idea of a complete switch over from cash crops to food crops in the cultivation of which they have no adequate experience. Moreover, there is the problem of getting adequate land in the vicinity for wet paddy cultivation. Indeed, having lost the market for some of the cash crops, some cultivators are trying to increase cultivation of paddy and other valuable crops on their own initiative wherever suitable land is available. But the problem of getting adequate funds for reclamation and improvement of land has acted as a serious handicap to them. Financial assistance to the needy and willing cultivators for reclamation works and taking up of more minor irrigation projects is very necessary. 178 241 633

As regards Government loans granted to cultivators, people complained that apart from being inadequate they are often untimely. As a result the people, needy as they are, utilise the amount for meeting their day to day consumption expenses. 241 651 659

There have been complaints that various improved seeds supplied by Government are of very inferior quality leading to waste of time and money of the poor people. The Department of Agriculture should not only check the quality of the seeds before issue but should also see that the seed are properly used by inexperienced cultivators who are newly taking up cultivation of these crops.

With the opening up of a few vital P. W. D. Roads transport of border products to Shillong and other places has greatly been facilitated but the problem of transporting them from remote interiors to the various local points on P. W. D. roads still remains unsolved. While during winter months these places may be negotiated by a man on foot up and down the steep gradients, during rainy seasons these tracks become slippery, the streams and rivulets are overflooded and it becomes impossible for a man to cross them, thus isolating the villages from each other leading to closure of trade and all other activities between villages. Properly planned and solid schemes for construction of feeder roads and bridges linking up these villages, will, apart from giving some works to the people alleviate much of the difficulties of transportation of agricultural produce. 659 491 659

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

178 241 waste of time. Chemical fertilisers are found to be used by some cultivators but there is still a large section of cultivators who feel sceptic about the use of fertilisers. There is need of continuation of training and demonstration in the proper use of fertilisers and manures.

The present method of hand threshing of paddy by beating with a stick of wood is a waste of time and labour. There is no reason why threshing cannot be done by using bullocks as in the plains.

General area.—

1. Mawphlang	Paddy and maize	Hoes, hoes and plough	Sometimes, hoes and plough	247
2. Jowai	Paddy, maize and millet	Hoes, hoes and plough	No.	
3. Byrnihat	Paddy, maize, etc.	Hoes, hoes and plough	No.	
4. Mawkaiong	Paddy, maize and potato	Hoes, hoes and plough	No.	
5. Amlo	Paddy, maize and millet	Hoes, hoes and plough	No.	
6. Langrinang	Paddy, maize and millet	Hoes, hoes and plough	Hoes and [illegible].	
7. Mawkhi	Paddy, potato and maize	Hoes, hoes and plough	Sometimes.	
8. Lapasia	Paddy and maize	Hoes, hoes and plough	No.	
9. Demiya	Paddy, potato and maize	Hoes and hoes	No.	
10. Jyngjar	Tapioca, sesame, millet and orange.	Hoes and hoes	No.	

This table reveals that in one region there is bias for cash crops and in the other for food crops—more or less depending upon the soil and topography of the regions. Extreme hardship occurs when there is deficiency in food production or a glut in the market of cash crops. The cash crop producers are, of course, trying to adapt their crops to the changing market conditions. With the loss of market for oranges, the people in the border areas are trying to increase their foodgrain production and start cultivating paddy, potatoes, etc. Throughout the district, people are trying to increase wet paddy cultivation. Wherever water is available, they spare no pain to convert it into a wet paddy field. Similarly, increasing interest is evident among the people in the cultivation of valuable crops like black-pepper, cashewnut, etc., which have a good prospect in the border areas. It is felt that there is considerable scope for investment of cultivation of chillies, turmeric, coffee, etc. But any new endeavour demands heavy initial investment which often is not within the reach of cultivators. Government should continue to advance adequate agricultural loans to the needy cultivators in a better planned manner.

Only 19 out of 88 villages reported use of bullock driven ploughs for wet paddy cultivation. But even in these villages animal power is not universally used. Of course, in the rocky fields people have no alternative to the use of hoes and spades but in some areas particularly in the wet paddy field, bullock driven ploughs may profitably be utilised. It is not that the farmers do not realise the advantage of ploughing but want of funds for purchase of bullocks, etc., is reputed to be the cause of continuance of the old practice. Both broadcasting and transplanting methods are in vogue in paddy cultivation the latter being a recent introduction is gaining popularity. Some farmers in the project area villages have tried line sowing but according to them it is very laborious and resorts to

A perusal of the table above will show that proportion of families following non-agricultural labour as principal occupation is higher in Sunthar area. Majority of these families were formerly engaged in agriculture but due to adverse circumstances arising out of Tarai[illegible] [illegible] have to take to other occupations. The child work and normal F. W. D. work gave employment to a large section of these people. Other avenues of employment are collection and carriage of fodder[illegible], woodcutting, and carting of merchandise, etc. Unlike to outsiders artisans and graziers who formed the bulk of the traders in the border area are largely the displaced persons and the Bengali people concentrated in Dhulagarh and Salar. Others are petty traders dealing in fruits, vegetables, fish, chatai and other handicraft. Under employments agriculturists, etc., come the Sipaw shellers, blacksmiths, carpenters, etc., Government agents, Educators, hunting etc., are shown as others.

8.18 In the following table the families in the three village groups are classified according to their subsidiary occupation.

DS: Mission G-4 (see date) 1997 AR? Khasi AR?

[illegible] great iron-smelters, and extensive excavations in the most favourable localities for obtaining immense power the means to which the manufacture was carried on. In some places the whole surface of the ground appears to have been dug up for a depth of several feet, leaving huge boulders standing up here and there. Of late years, however, as the price of labour in the Hills has risen, the trade in iron has died away, and there is now little demand for the Khasi article, the cheaper English metal having driven it out of the market.

Caves, Pagodas.—Many peculiar caves and caverns are found in the limestone rock formation, the most notable being the cave at Chorai Pitij and at Bilpakhi in Jaintia. In the latter place the caverns extend a great distance beneath the earth, one being imagined by the people to reach as far as China, and a Hindu legend states that a Chinese army once marched by this route to the invasion of India. In another cave, the limestone stalactites have been carved into images representing the gods of the Hindu pantheon. On the banks of the Kupili river on the Cachar border, at a place called Sumri, there is a hot spring, the water of which contains carbonate of lime. All the rivers in the Hills flow through gorges in certain parts of their courses, the most picturesque being at Tuboi, where a small stream is compressed into deep pools among limestone rocks; and at Dawing and Songhi, where the Wangu and Mawkiriu rivers respectively debouch upon the plains.

Forests, etc.—The India-rubber or caoutchouc tree is found in many forests throughout the Hills, but not in great numbers, and the supply and value of the gum has much decreased of late years. In olden times the right of tapping the trees in the Jaintia Hills used to be leased out for a sum of [illegible] rupees, but by which the trade had [illegible] towards the Brahmaputra valley, but through the dearth of water carriage they are of no great value. Vigorous efforts are being made to preserve the forests in the higher plateaus. Owing to the habit of firing the jungle in spring prior to sowing, great waste of valuable timber has taken place; but since the country has been separated from Sylhet and placed under the administration of the Chief Commissioner of Assam, attention has been given to the matter, and special areas are now being set apart for the preservation and growth of forest timber. Cinnamon grows wild in some parts of the country. There is a considerable trade carried on in

— ACCOUNT OF KHASI AND JAINTIA HILLS.

141 In the interior of the Hills the larger villages are mere clusters of huts. The great majority of the inhabitants are employed in agri-
142 culture, but there are no data upon which a proportion of agricultural to non-agricultural people could be based.

147 There is no immigration into the District. Both the Khiahs and the Synteng have been successful in preserving to the present day their primitive isolation, free from the interference of Hindu-
148 ism. They still maintain their aboriginal forms of belief and religious worship, and repudiate alike the authority of Brahmans and the entire system of caste. To some extent, however, they have
170 given way to Hindu prejudices in the matter of purity of food. The
242 few Hindus to be found in the Hills are temporary residents, employed in civil and military employ, who always contemplate returning
141 to their own homes. The traders are for the most part natives of the
141 Hills, for the Marwari merchants, who penetrate into every other corner of Assam, have been able to obtain no footing in the face of Khasi competition. There is likewise no emigration from the District. The Khasis are a well-to-do and contented race, and
144 either produce themselves or obtain by trade sufficient to satisfy their scanty wants. A certain number of both Khiahs and Synteng proceed southwards every year to work on the tea gardens of Cachar and Sylhet, but such absence from home is only temporary.

243 AGRICULTURE: RICE.—Thirteen different varieties of rice are cultivated in the District, of which the following is a list, giving the Khasi name as well as the description of the grain:—(1) *U-lyda-thlyrdew* (u, the masculine article, meaning "the," and *lyda*, meaning "paddy"), brown rice with long grain; (2) *u-lyda-thlyrdew-lawlih*, a white rice with long grain; (3) *u-lyda-lo-ion*, round-grained rice; (4) *u-lyda-kwai*, speckled, hooked; (5) *u-lyda-u-* "earth," *ka-u-* "this," *sang-u-* "black"); (6) *u-lyda-ka-ith*, white rice; (7) *u-lyda-u-ma*, scented rice (literally *u-* "the," *lyda-* "paddy," *u-ma-* "scent"); (8) *u-lyda-la-kroh*, large-grained rice; (9) *u-lyda-ka-shang*, small-grained rice; (10) *u-lyda-u-ha*, early rice; (11) *u-lyda-ka-ban*, late rice; (12) *u-lyda-ksop-la*, rice grown along with beans; (13) *u-lyda-ka-ioh*, small rice.

Rice is cultivated in marshy fields situated near running water as well as in high lands. The first seven of the above thirteen species of rice are sown in marshy lands during the months of April and May,

59: Hunter G-4 (no date) 1897 AR? Khasi AR?

[illegible] either for food or as articles of trade. A pair of ploughing 231
oxen are worth about Rs. 30, or £2, 0s.; an ordinary cow, Rs. 12, 435
or £1, 4s.; a score of kids six months old, Rs. 18, or £1, 10s.; and
a score of full-grown pigs, from Rs. 100 to Rs. 180, or from £10 to
£18.

THE AGRICULTURAL IMPLEMENTS in use in the District consist 241
of a plough, called *ka-ploghir* in Khásí, and a hoe or *kuhál*, called 407
ka-ruhtiri. When the cultivation is carried on by means of oxen,
the plough is used, the hoe alone being used where the land is cul-
tivated by manual labour. In the Khásí Hills the use of the plough,
except in a few rare cases, is entirely unknown; but in the Jaintia
Hills, oxen and ploughs are used to a greater extent. What is [475]
technically termed "a plough" of land is equivalent to four English
acres; a pair of oxen, together with the necessary implements, would
represent a capital of about Rs. 40, or £4.

WAGES.—The Deputy-Commissioner reports that the price of 178
labour in the District has more than doubled in the last ten years. 469
The rates obtaining at present are from eighpence to one shilling 465
a day for an ordinary labourer, and from one shilling to eighteen-
pence a day for a person. An agricultural day-labourer earns eighteen-
and a woman at the same work fourpence-halfpenny a day. Brick-
layers, carpenters, and blacksmiths earn from a shilling to eighteen-
pence a day. The new System of Shillong, the present seat of the
Local Government, was established in May 1864, and since then
does the demand for labour has markedly increased. The extension [244]
of the cultivation of potatoes has also had an appreciable
effect on the price of labour.

PRICES OF FOOD GRAINS.—Of the different descriptions of rice in 435
the markets of the District, the better sorts are imported from the 439
neighbouring Districts of Sylhet and Kámrúp. The best produce 242
is considered fit only for the use of the Khásís. The price of the

the supplies come. In a distant market like that of Shillong, rice
of the best quality generally sells at from 6 to 7 *seers* for the rupee,
or from 16s. to 18s. 6d. per cwt.; and rice of inferior quality, which
is only used by the poorer classes, at from 9 to 10 *seers* for the rupee,
or from 11s. 6d. to 14s. 3d. per cwt. Little or no trade is carried on
in unhusked grain. Paddy produced in the District generally sells
at an average of from 13 to 18 *seers* per rupee, or from 3s. to 3s. 6d.
per cwt. Indian corn, which is only grown to a small extent, is sold

20: Hunter G-4 (no date) 1997 AR? Khasi AR?

or Rs. [illegible], or £[illegible], and the revenue derived by Government from the quarries was Rs. 87,[illegible], or £[illegible]. In addition, the Khasi Chiefs receive a revenue from this source of more than £[illegible]. 609 651 317

Iron.—The smelting of iron was once the chief industry in the Khasi Hills, and a considerable quantity of the metal used to be exported into Sylhet, both in the crude and the manufactured state. Recently, however, this industry has almost died out, in the face of the competition of the superior article imported from England and sold in the plains at a cheaper rate. The indigenous methods of smelting, washing, and smelting the ore have been minutely described by Professor Oldham. The following description is taken from Mr. Allen's Report, dated 1878, at which date the annual export of smelted iron was estimated at [illegible] maunds, valued at Rs. [illegible], or £[illegible], at the rate of Rs. [illegible] per maund:—"The ore is said to be most abundant and of the best quality in the State of Khyrim, especially at the villages of Tangkhar and Pryandih. A few iron articles, such as axes or bill hooks, dahs or matchets, spear and arrow-heads, are manufactured by the Khasi smiths in the Hills; but the greater bulk of the smelted iron is sent to the plains for sale in circular lumps weighing about 2 or 3 seers. These lumps, called *dwi*, sell at Chikandi for from Rs. [illegible] to Rs. [illegible] per maund. The best iron, however, which is known into iron called *pah*, sells for from Rs. [illegible] to Rs. [illegible] per maund. Khasi iron is preferred to English, in consequence of its greater malleability. It is much used by the native iron-builders of Sylhet and the neighbouring Districts to make fastenings for the corners of their boats. When brought into the market, it is more than half down, and it is this circumstance which renders the iron trade unprofitable. The cost of carriage from the Hills to the plains is about 6 annas per maund, and the traders, who are all Khasis themselves, allege that they get an average profit of only 2 annas per maund." The tables of trade for [illegible] return no smelted iron as imported from the Hills, but Rs. [illegible] of iron implements imported, against nails and horseshoes imported to the value of Rs. [illegible]. 178 125 439 [324] [615] [501]

The Manufactures of the District, besides iron, consist of coarse cotton and muslin cloth, plain silver work, rude implements of husbandry, coarse bags made of the fibre of the pineapple, coarse pottery, and mats and baskets. With the exception of the 28 [illegible]

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

439
648
245
434

previous twenty years. The oranges, like the limes, were brought down to Mr. Ingle' depot at Chhatak, where they were sold to the dealers at the rate of about Rs. 1. 12 per 1000, or less than half their previous estimated price. It is stated in Mr. Allen's Report, that the Calcutta market was then chiefly supplied from the groves of Shella Pinji and Bar Pinji; the produce of the other villages was more perishable, and required to be sold in the neighbouring Districts. The fruit is known in Calcutta as "Sylhet oranges." The Bengal registration returns for 1876-77 show a total export from Sylhet of 64,503 seconds of "fruit," valued at Rs. 155,575, or £15,551.

439

The export of raw cotton appears to have greatly increased. In 1876-77 the total quantity exported was 36,000 seconds, valued at Rs. 108,000, or £10,800, at the rate of Rs. 6 per second. Twenty years before the export had been only 12,000 seconds, valued at Rs. 40,000, at the rate of only Rs. 3. 8 per second. The cotton is of inferior quality, with a short and weakly staple. It is chiefly consumed by the Sylhet weavers. The total registered export from that District in 1876-77 was only 2,500 seconds, valued at Rs. 64,500, at the high rate of Rs. 25 per second.

439
439
178
245

The chief article of import now, as twenty years ago, is rice; for the hill-men have never grown sufficient for their own consumption, and the recent establishment of the Civil Station of Shillong has increased the demand. In 1876-77 the total imports of rice were estimated at 203,600 seconds, valued at Rs. 700,300, or £70,030, at the rate of Rs. 3. 8 per second. Twenty years ago the imports were nearly as great, viz. 172,000 seconds; but the value was only Rs. 215,000, at the rate of Rs. 1. 8 per second, or less than one-half the present value. The chief source of supply is Sylhet District, which sends to surplus to the tea gardens of Cachar, as well as to these Hills, and also exported, in the year 1876-77, 214,000 seconds of rice and 233,000 seconds of paddy into Bengal.

The importation of fish (fresh and dried) has enormously increased. In 1876-77 the total amount was 35,000 seconds, valued at Rs. 105,000, or £10,500, at the rate of Rs. 3 per second. Twenty years ago the value was only Rs. 20,000, but the quantity is not given. The preparation of dried fish is a flourishing industry in the adjoining District of Sylhet.

The importation of cotton cloth has increased in an almost equal proportion. The value in 1876-77 was Rs. 178,000, or £17,800, at

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

625 In 1835, when British authority was first extended to the Khásí
648 Hills, the cost of maintaining the police, from the rank of *jowáddár* or head constable upwards, was £25; and in 1840, £32, 16s. By
965 1860, when the Jáinti Hills had been annexed, and a *thánd* opened at Jowái, the cost had risen to £480. In the year 1869 the strength of the regular police was 149 men in the Khásí Hills, and an additional 19 in Jáinti.

In 1873 the police stations of the Khásí and Jáinti Hills were as follow:—The force consisted of 2 inspectors on a salary of aggregate of Rs. 100 a month, or £120 a year; 3 sub-inspectors and 19 head constables on a salary of less than Rs. 100 a month; and 113 constables on an average pay of Rs. 9 a month, or £10, 16s. a year. The total pay of subordinate officers amounted to Rs. 8,340 or £834 a year; and the total pay of constables to Rs. 12,168 or £1216, 16s. Certain contingencies bringing up the aggregate expenses to Rs. 24,363 or £2436, 16s. The total number of men of all ranks was 132. As compared with the area and population of the District, these figures show one man to every 18·49 square miles, or to every 1,133 persons of the population, maintained at a cost of Rs. 2 : 10 to Rs. 13·6 per square mile, and of 2 annas 12 pies to 2·6 per head of population. Of the total force, 1 officer and 13 men were employed to guard the jail, 3 officers and 23 men to guard the treasury and lock-up and to serve as escorts, leaving 14 officers and 77 men available for general duty.

649 Criminal Statistics.—The District of the Khásí and Jáinti Hills,
692 like the other Hill Districts of Assam, is administered by political officers, under special rules framed under Act xxii of 1869. Petty criminal cases are disposed of by the indigenous magistracy, and only cases of a heinous character are reported to the political officers. Similarly, civil cases are referred to arbitration, according to the indigenous system of village *pancháyat*; and the Deputy-Commissioner reports that this system, while affording equal justice to the people, tends to preserve them from the evil of litigiousness.

679 In 1874 the total number of cases reported by the police to the
171 political officers was 83, as compared with 83 in the previous year. In these 83 cases, 102 persons were arrested, of whom 71 were put on their trial; 61 persons, or 86 per cent., were convicted, and 10 were acquitted.

Though little serious crime exists in the Hills, yet the number of offences shows a tendency towards increase. The Report of the

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

Deputy-Commissioner for 1876-77 states that in that year 168 persons in all were brought before the magistracy, the most common classes of cases being theft and house trespass. In the same year 89 civil suits were instituted, of which 83 were for money claims, 2 for immoveable property, 2 for restitution of conjugal rights, and 2 in connection with religion and caste. In the Political Court there were 31 cases tried during the year, of which 13 were civil and 18 criminal. In the latter class of cases persons issued against 60 persons, of whom 20 were convicted and 40 acquitted. The details of the two following cases will illustrate the condition of social life in the District. The first was a case of grievous hurt. The Siem of Mylliem had sent four persons to fetch a man named U Dorja, who had been selected to marry the Siem's sister. While on their way the messengers were attacked by a number of persons, evidently relatives of U Dorja who were opposed to the marriage. One of them was severely beaten, and died within twelve days from pneumonia. The offenders, numbering five in all, were sentenced to pay a fine of Rs. 10 (£1) each, or in default to suffer fourteen days' imprisonment. The second case was one of oppression. It originated in a dispute about land, situated in a locality over which both the Siem of Nongkhlaw and the Lyngdoh of Sohiong claimed to exercise jurisdiction. The parties out of possession had gone to lay their complaint before the Siem, whereupon the Lyngdoh, with eight other persons, seized three of the complainants' kinsmen, disrobed them, and kept them in durance with the object of having the complaint submitted to himself for adjudication. The Lyngdoh was sentenced to a fine of Rs. 50 (£5), and his companions were warned and discharged.

JAIL STATISTICS.—There are two jails in the Khasi and Jaintia Hills:—(1) The jail at Shillong, which is directly under the charge of the Deputy-Commissioner; and (2) the lock-up at Jowai, under the Assistant-Commissioner. It has been proposed to build a new jail at Shillong; the present structure consists only of bamboo huts, surrounded by a fence of the same material.

The following are the jail statistics for 1875:—Daily average number of prisoners, 40·30, of whom 1·05 were females; daily average number of sick, 1·40; number of deaths, 4, or 10 per cent. of the average daily strength. The total expenditure was Rs. 3,430 (£343), or an average of Rs. 181 (£18, 10s.) per prisoner. This high rate of expenditure is due to the cost of rations at Shillong.

P. Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

manufactured of saltpetre, sulphur, and charcoal, the three ingredients being pounded together in a mortar. The Jaintia Rajas possessed cannon, two specimens of which are still to be seen at Jaintiapur. Their dimensions are as follows:—

Length, 9 feet; circumference in the middle, 3 feet 2 inches; diameter of the bore 3 inches. There are some old cannon also at Nongkyrdem and at Kyndiar in the Khyrim State, of the same description as above. These cannon were captured from the Jaintia Raja by the Siem of Nongkrem. No specimens of the cannon ball used are unfortunately available. There are also small mortars, specimens of which are to be seen in the house of the Siem of Mylliem.

The weapons of the Syntengs are the same as those of the Khasis, although some of them are called by different names. At Nartiang I saw an old Khasi gun, which the people say was fired from the shoulder. I also saw a mortar of the same pattern as those described amongst the Khasi weapons.

The War and Lyngngam weapons are also the same, but with different names. The only weapons used by the Bhois (Mikirs) are the spear and bill-hook for cutting down jungle. Butler, writing of the Mikirs 1854, says, "Unlike any other hill tribes of whom we have any knowledge, the Mikirs seem devoid of anything approaching to a martial spirit. They are a quiet, industrious race of cultivators, and the only weapons used by them are the spear and the hand-bill for cutting down jungle. It is said, after an attempt to revolt from the Assamese rule they were made to forswear the use of arms, which is the cause of the present generation having no predilection for war."

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

the matrilineal descent group has a distinguished function only when there is common residence and common property. 178

In Kongton, among 9 different *kur* (List 10), Pohnong and Khonsit accounted for the majority of the population, while the rest, seven *kur*, were more or less of equal size. On the whole the population seemed more stable than that of Sohkyndoh. However, as in Sohkyndoh, actual descent groups amounted to 41, many of which have the same *kur* name but could not always establish genealogical relationship with one another; nor was there any functional cohesion. I failed to reconstruct the history of the formation of these descent groups: the villagers had no memory of their past except very fragmentary information which was quite insufficient to account for their present composition. They only insisted this was a very old village in comparison with Sohkyndoh and other neighbouring villages. 613 614 621 [182]

While I was struggling with the villagers' scant accounts of their past and fragmented kinship relations among the present households, I was struck by the poverty of the villagers' genealogical memory in comparison with that of the Garo. Suppose A, B and C, who belonged to the same property-holding descent group three generations back: A and B being sisters and C being B's daughter. If B, including her descendants, moved away from the village two generations back, the present generation of A's and C's descendants would easily lose contact and knowledge of their genealogical relationship. This fact, on the other hand, illustrates some important aspects of the Khasi social structure: the kinship relation—matrilineal descent link—is not a significant factor beyond the scale of the household (property-holding descent group), and locality is more important than matrilineal descent for the formation of the Khasi community. Through the predominant practice of endogamy on the level of the village, the small segments (found on a level of a household or a group of a few households) of various different *kur* clustered in a village are linked by affinal relations each other, by which altogether form a well knit social organization of a village community. The cohesion and solidarity of the Khasi village community is strengthened by the local endogamy not by the localized lineage organization. 182 613 621

In fact, in contrast with the rather loose kinship relations which link different households, the affinal relations link almost every households in the village, as shown in Fig. 10. The lines, ———, indicate marriage relations between living members of households, and the lines, - - - - -, indicate affinal relations established through dead members of present households or through spouses' kinship relations at Sohkyndoh, as in November 1955. In this way, except for one household (24), members of a single household are all linked together through affinal or cognatic ties. In some cases, the affinal relations between 602 621

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

society? Among the matrilineal Central Bantus, Richards says that the determining factor in residence at marriage is the marriage payment or the type of goods and services which the bridegroom gives (Richards, 1950, p. 249). However, the Khasi have no such custom in the marriage contract, it is therefore out of the question to explain the two types of residence in this way. In the case of the Khasi, the determining factor is the type of marriage with relation to the rule of inheritance and ownership of property, which is clearly related to the structure of the *iing*. Khasi marriages can be divided into two categories i.e., marriage with an heiress and with a non-heiress. Marriages with an heiress must be uxorilocal. This accounts for category 1 or 3 of the household pattern. On the other hand, marriages with a non-heiress become neolocal and correspond to category 4 of the household unit.

IV. Marriage with the Heiress

A man married to an heiress, usually lives with his wife's parents and her unmarried or divorced brothers and sisters. For a man, life after marriage under such circumstances require great adjustment and endurance. The husband's status is especially weak when a male member of the wife's kin lives in the same household. The management of property and all economic activities are entirely controlled by the authority (wife's brother or maternal uncle) of the *iing*. The husband works in the wife's field under constant supervision from this authority. Both economic activities and domestic affairs are always under the management of this authority. The children have more attachment to, and are more obedient to, the maternal uncle than to the father. The tie between the uncle and the nephew is so strong that the father is rather like an additional member of the household. He is the last person to be introduced to visitors.

This family system is clearly reflected in the daily behaviour. When we visited the Khasi household of a youngest daughter, if a man (obviously the husband) came first to greet us, he always said "please wait, my wife (or mother-in-law) is coming." And it was the wife who entertained us, offering tea or pan and discussing matters with us, while her husband remained silent in the corner of the room, or in the next room. If her uncle or brother was there, *he* would be the person who talked to us, while his niece or sister served us. In such a case, we were seldom introduced to the husband. When I was working at Shella, I happened to stay in such a family. I had hardly any opportunity to talk to the husband during the two weeks of my stay. He left the house very early in the morning and came back late in the evening from the fields. While he was at home, he was

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

household are easily understandable in the light of the economic aspect of the fission of the *iing*. As I stated before, the non-heiress is given hardly any share of the property of her natal *iing* on her marriage (if the *iing* is rich a non-heiress and the sons may receive some part), and even if her new household happens to face serious economic difficulty, her natal *iing*, whose authority is vested in her brother, does not usually help her. This fact clearly suggests that brothers can have only limited rights over the elder sister's *iing*.

This is the crucial point of the Khasi matrilineal system. The *iing* is a very restricted descent group, giving opportunities to split off by those who have no right to inheritance. The *iing* has vertical continuity without expansion in collateral lines. Therefore, even the siblings of the same mother do not always form a completely constant unit of a functional descent group, since the elder sisters are oriented by their marriages to form a new *iing*, though they may retain their membership in their natal *iing*. The central core of the *iing* in the particular sibling bond between a sister (the heiress) and a brother (the authority), a pair of statuses. Other sisters are ready to leave and other brothers are fluid members, clearly differentiated in status from that particular brother (authority) and sister (heiress). This structural principle should be compared with other matrilineal descent groups, whose sibling group is based on interdependence between members of a group, not between particular persons or statuses. The structural unit of the Khasi social organization, is *not* the descent group based on sibling links, but the *iing*, though descent is the principal factor, and the limiting one, in the formation of the *iing* institution. The descent factor is delineated by the functional force of the inheritance rule through female ultimogeniture, which results in constant internal fission and segmentation in the descent group. Technically, it is very similar to the process of fission of the Garo *mah* on the ungeniture principle, though the internal structure is different.

The establishment of a new household by a Khasi woman with her husband, means the beginning of the establishment of a new *iing*, separated from her natal *iing* not only in residence but also sociologically. In other words, it is the process of fission and segmentation of an *iing*, matrilineal descent group. Therefore, a woman who has once established a new household independent of her natal household, will not go back to her natal house i.e. her mother's descent group, though her bond with her mother's descent group remains undiminished. Of course she may visit her natal *iing* occasionally, but in fact, much less than her husband will visit his natal *iing*. In this respect as well the Khasi manifest structural differences from the Ashanti as described by Fortes, where a mother goes back to her own matricentral household and often prefers to reside there (Fortes, 1949, p. 77). Even

15: Nakane E-5 (1955-1956)1967 AR7 Khasi AR7

182 586 613 736 Even after divorce or husband's death the Khasi woman stays on in her household. Indeed many divorced or widowed poor wives, whose children are still small, try their best to live and bring up their children by themselves without asking their brothers' help. Of course a mother and her small children may go back to live in her natal *iing*. Such cases are found particularly when the woman's *iing* is rich. However, during my field work, I found no sense of psychological inferiority in Khasi women, widows or divorcees, such as we usually find in other societies. The personality of the individual seems to reflect the social structure.

182 184 586 593 613 Given such strong residential independence on the part of the non-heiress, economically divorced from her descent group, and oriented towards sociological separation from it, the husband's economic and social contribution is amply rewarded by the establishment of a stable, happier, matrimonial life. In fact, as already mentioned, the divorce rate among such couples is very low contrasted with the high rate among marriages with heiresses. More accurately, I should say that divorce is more likely to occur among the latter owing to the conflict of loyalties towards spouse and *iing*. Therefore, when each partner has less loyalty towards his or her natal *iing*, the divorce cases become correspondingly fewer. Thus, among the Khasi, successful marriages are frequently found where there is branching off from an *iing*. And a new *iing* is always established by a husband's contribution.

182 184 581 Khasi men, who are well aware of this fact, prefer to marry a non-heiress, since they will then form an independent household and remain immune to pressure from their wife's kin. However, they say a poor or lazy man prefers marriage with an heiress. As Richards said of the matrilineal Central Bantu, the residence on marriage seems to be a most important index of the husband's status, though the determining factors of the residence of the Khasi differ from those of the Bantu (see p. 124).

182 184 587 593 613 736 In the case of marriage with an heiress, when the wife dies, the husband usually returns to his own or younger sister's house; but in marriage with a non-heiress the husband often remains with his children, if his children are not too small and he is not planning to marry any woman other than his late wife's younger sister. If he marries his wife's younger sister, he has the right to stay on. This kind of sororal marriage cannot take place in the case of a man married to an heiress, since a Khasi man is not allowed to marry the late wife's elder sister. This form of sororate is found among the Khasi, but the levirate is unknown, such as can be seen among the Ashanti and the Ila, where a man takes his late brother's wife. Among the Khasi, even if a widow happened to marry her late husband's

182 587

15: Nakane K-5 (1955-1956) 1967 AR7 Khasi AR7

brother (actually not likely to happen), the levirate has no sociological implication in the social structure, which is specifically related to the residence rule. The levirate seems to have a significant function only when a marriage is virilocal—when the husband has full rights over his residence and property. This is also another aspect where the Khasi structure shows a marked difference from that of the Ashanti and the Ila, etc. 182 587

VI. Marriage of the Man of Authority of an *Iing*

Among these successful marital families, there are also shadows of a matrilineal order. These affect especially those men who are in the position of authority in an *iing*. Such a man, though he has an independent household with his wife and children, often visits his youngest sister's (or sister's) house, *iing (he iing aw)*, and sometimes stays there. Such a man's attachment to his *iing* is not only social or psychological, but also often economic. The man, as authority of his natal *iing*, usually has economic control over the management, particularly so, if his *iing* has considerable property or active trading business. As husband/father in his family he works for his wife and children, but often takes into consideration as well the interests of his *iing*. I found such cases especially among richer villagers in Shella and Jaitiang, where the main economic activities were based on trading. 592 599 602 619 [182]

Among the Khasi, it is quite a traditional rule of the division of labour that women engage in trading activities at markets whether on a large or small scale. Husbands may carry goods from field to market, but male members are kept away from the actual scene of the selling and buying. However, these activities on the part of the women are controlled and accounted for by their uncle or brother, or even son (or, if no male member is available, by the husband), though in many cases they form separate domestic families. The man's control over the trade appears more marked where the scale of economic of *iings*. [443] [462]

A man of Jaitiang, who worked in a shop in Halflong, spent his salary in keeping his wife and children, but at the same time he kept the accounts of his sister who was a professional merchant. Thus, the economy of the *iing* and that of the co-residential group are crossed by the dual role of the man. Hence, among the Khasi, residential autonomy is not always an indication of economic autonomy. However, it should be clearly understood that a man's acquired property goes to his co-residential group, not to his *iing*. [421]

A man of authority is attached to his *iing* by the stronger ties of religious, social and economic (management) duties as well as by

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Thus, the marriage of a non-heiress and a man of authority also produces an unstable position for the husband in spite of his having an independent household. Therefore, the possibility of a really stable marriage is even more limited; it will occur only in the match of a non-heiress and a non-authority of the *sing*. But even these marriages cannot be free from the influence of a matrilineal social structure: the man of authority of the wife's *sing* may visit these couples now and then, curb the husband's power and remind both partners of the orientation towards the matri-kin, the *sing*, though this pressure is insignificant in comparison with that experienced by the heiress's family. Likewise, a husband now and then visits his youngest sister's house, *ka sing* sw. These constant matrilineal contacts offer husbands chances of escaping from even the slightest matrimonial tension. Whenever a Khasi man feels uneasiness, he will return to his sister's house rather than face a difficult situation with his wife. This tendency is maximized especially on the occasion of religious ceremonies, when all individuals are grouped around each *sing*.

It is apparent that the rules of the *sing* as the underlying structural pattern, function throughout the various categories of domestic unit of the Khasi community as the most important intrinsic force.

VII. Polygyny

After this long attempt at the structural analysis of marriages, I think one can theoretically predict what is the situation of polygyny among the Khasi. The theoretical framework elaborated through preceding discussions can also be tested by the empirical data in terms of polygyny.

Nowadays, the Khasi feel so strongly against polygyny that they have no knowledge even that they ever practised it. Many Khasi, in more sophisticated areas, did not believe my findings on polygyny in Sohkynrdah and Kongtoo. I think this is due to the rapid Christianization of the Hills during the last hundred years. My interpreter, though he was not Christian, said to me in the village, "It is most reprehensible to bring you to a village where we find polygyny." However, one of the ministers of the Cherra State to which the two villages belong, told me that there was no particular opposition to polygyny, though recent Christian influence gave people the idea that it was a shameful custom, and he mentioned the case of a polygynist in his own, a man who had recently died, who had had ten wives. In Jaitinga where inhabitants are all Christian, and in Shella where there has been much contact with, and influence by, Hindus, there were

15: Nakane E-5 (1955-1956) 1967 AR? Khasi AR?

which I described previously, where a man brings his secondary wives to his first wife's house in which he is acting as the head. Furthermore, sororal polygyny is prohibited, while it was preferred among the Garo in terms of wives taken from the same *mahari*, though mostly not real sisters. The strong jealousy, which I observed, among the Khasi wives of a polygynist, would appear to make such polygynous marriages with closely related women practically impossible. As shown in List 6 & 9 every single one of the wives of each polygynist belongs to different *kur*, and the two secondary wives of the man of Kongkon came from neighbouring villages. 591 595 [171]

These aspects of Khasi polygyny are related fundamentally to the underlying Khasi social structure. It should be remembered that every married woman has her independent household, *iing*, and that two women of different descent groups never reside together (see p. 127). The picture is one of every married woman holding a key-point in the whole network of the social system, and men fit into this network with much flexibility. The strong stability of women and the fluid nature of men in terms of residence naturally produces this form of polygyny. This analogy is also true of lovers' relations and illegal marriages. Though polygyny is a rapidly decreasing institution all over the Khasi Hills, cases of lovers' relations and illegal marriages are found to be very numerous among the Khasi, as compared with neighbouring tribes and peoples in Assam. 182 591 595 619 837 [171]

Throughout my discussions of various forms of Khasi marriage, I found men to be more or less in the position wittily described by one of them as "having one leg in my sister's house, the other in my wife's," except in cases of the husband/father who succeeds in establishing paternal authority, as in marriages with a non-kinsman. Even in the latter a man might have a period of uncertainty until his children were born and until the economic basis for his matrimonial life was firmly established. For the rest, Khasi men would be in the position of either becoming the authority of an *iing*, or swinging between their sister and their wife, which may produce more opportunities for lovers' relations. One of a man's legs is certainly always found in his sister's house, the other may rest in his wife's, but it may also rest in another woman's house. The wife being rather accustomed to his occasional absence due to his visits to his sister's house, another kind of absence does not mark any great change from the usual situation, at least not physically. Such situations occur particularly in the earlier stage of the marriage, as a sort of continuation of premarital affairs, which are quite freely practised: it is a usual custom before marriage for young men to sleep at a girl's house whom they like though they say sexual intercourse usually does not take place in such cases. This I observed in Sohkynduh and Kongkon. 182 591 593 619 856 837

15: Nakano E-5 (1955-1956) 1967 AR7 Khasi AR7

• 182 595 Because of the firm right of women over the residence, Khasi polygyny can never be a clearly distinguishable institution, and has no operational advantage in the social and economic fields; the situation is very similar with lovers' relations and illegal marriages. By polygyny the man achieves no additional economic advantage, nor does he increase his social status or prestige; rather the reverse, for I observed that the polygynyst was regarded as a somewhat ludicrous or tragic figure. As for the woman, she is placed slightly at a disadvantage since the husband's economic activities are not concentrated on her household. However, even many legally-married wives are separated or divorced, so that such disadvantages are not only experienced by the wives of polygynists. The social disadvantage of being secondary wife is not serious, firstly, because wives, whether first or secondary, have social and economic independence—they do not belong to the husband as in the case of patrilineal systems. Secondly, the significance attached to the legal marriage institution is not so great, so that the handicap of being the secondary wife is not severe. What is most important, furthermore, is that her slightly inferior status does in no ways affect the next generation. Indeed such children, including [949] those of premarital or illegal relations, suffer no serious social dis- [951] advantage, though they are nominally distinguishable from legitimate children. From this it is clear that the effectiveness of legitimate marriage, and paternal recognition are rather limited among the Khasi.

Thus, Khasi polygyny differs greatly from the polygyny of other societies in terms of its operation and of its form. It also differs in the incentive to its practice. Among the Garo and many other societies, the practice of polygyny usually depends on a man's economic capability, but among the Khasi, it appears rather to depend on his 182 whim. Khasi husbands are notorious for their heavy drinking and 599 neglect of wife and children. Some of them told me that their earnings, 997 their children and everything they acquired go to their wife or sister, leaving them with nothing; therefore they should at least have freedom to enjoy their life. This freedom seemed to mean women and drink. I am not sure how far this explanation is true, but it seems to justify their behaviour to a certain extent. I do not mean that this is the general characteristic of the Khasi husbands, but some such tendency is to be observed. Actually I often heard wives complain of their husbands' drinking and running after women, and was asked "Are your Japanese husbands also like that?", "What is the good of having a husband!" then comes divorce . . .

182 On the contrary, women placed at an advantage by residence 562 and matrilineal inheritance, are required always to be on their best 595 behaviour. There are very strict rules governing the behaviour of Khasi women. They are supposed not to drink, smoke, or play with

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

any man other than their husband. Women before marriage enjoy a considerable freedom in love affairs, but once married these are no longer tolerated. Women should be faithful wives. They should be so in order to keep their husbands who have a strong tendency to leave their wives. The husband of a woman who has an affair with another man, will never come back to her. There is no attraction to draw the husband, who has home at his sister's, to his wife's house unless she is good and charming. Such Gurdon's remarks as "There is no evidence to show that polyandry ever existed among the Khasis. Unlike the Tibetans, the Khasi women seem to have contented themselves always with one husband, at any rate with one at a time" (Gurdon, 1914, p. 77), is utterly nonsense: a Khasi woman is placed in a situation which is not easy to monopolize even one husband. Moreover, the Khasi social organization in general does not accord to the practice of polyandry.

I

The discussion of Parts I and II reveals that the social structure of the Garo and the Khasi differ greatly. Similarity is found only at the level of the minimum criteria of matrilineal systems: the basic succession rules of mother-daughter, mother's brother-sister's son, and the fact that property is owned by the women, but the controlling power and authority over it are in the hands of the men.

One of the most outstanding structural differences between the two lies in the composition of a property group: the property group of the Khasi is formed by a descent group at a shallow generation depth, while that of the Garo is maintained by the cooperation of two local lines, each of which represents a localized lineage group. Hence the descent group of the former tends to have stronger solidarity, whereas the latter tends to be weakened in its solidarity.

In a broad framework, in terms of social organization, the Garo fall structurally into a category based on the moety arrangement, in which patrilineal systems, such as the Murngin, and the Karieri, etc., are also to be found. Theoretically, this type of mechanism is operative in either matrilineal or patrilineal systems: by the exchange of men in the former and the exchange of women in the latter.

On the other hand, the Khasi system presents more outstanding features of a type which is generally accepted as belonging to matrilineal systems. However, the basic structural traits of this system may also be found among patrilineal systems, in terms of relatively stronger descent group solidarity.

FIG. 10. — *Succession Lines of Female and Male in the Matrilineal System.*

Lines *A* and *B* may include sister-sister, and brother-brother relation respectively, also members of classificatory category; variations in these minor points depend on each matrilineal system.

Though both matrilineal and patrilineal systems may share such basic structural categories, they differ significantly in the following respects: in matrilineal systems, the ownership of property and the authority over the property group never rest in one person, as in the case of the father/husband of the patrilineal systems, and the succession to these two offices follows the female line (mother-daughter) and the male line (mother's brother-sister's son) as shown in line *A* and line *B* in Fig. 10. This duality of office-holding individuals within the succession rule is the intrinsic cause

of complications and variations in matrilineal systems. The matrilineal system is not a mirror of the patrilineal system; it is a different system in which more complicated mechanisms are involved. This complexity of the matrilineal system is a decided handicap when it comes to meeting radical economic changes. In order to preserve the system, a fairly stable economy is required, well-balanced in its population and resources. This may be one of the reasons for the rapid disintegration or unstability of social organization of matrilineal peoples in the world.

The difficulty of preserving in function both lines *A* and *B* is caused by residential problems—individual marriages which contradict the sibling solution. According to my theoretical analysis, there are four alternative ways of resolving such contradictory factors, each one being represented by actual ethnographic samples.[1] Each arrangement represents a different degree of the function of the two lines *A* and *B* in relation to the residential pattern, as following (see Fig. 13):

Fig. 13. — Central Case of Matrilineage in Relation to Property Group and Residential Group.

The Garo case. The residential type is 'husband-with' instead of 'brother-sister.' The function of both lines *A* and *B* is equally strong. This is done by the marriage contract between two local lines, so that it is possible to keep the function of each line against the residential separation of the two lines in one descent group. This type is found at the moment only among the Garo.

1. For this discussion I take only such major matrilineal samples for which simple documentation is available.

The Nayar type. The counter scheme of the Garo type, the co-residential type is 'brother-sister' instead of 'husband-wife'. The function of both line A and B is equally strong. This type is found among the traditional Nayar (except those in North Malabar) and the Mosophulous matrilineal people.

The Khasi type. The ideal co-residential type consists of a woman with either her husband or her brother. The function of line A is much stronger than that of line B. This type is found among the Khasi, the Naga, the Ceni, the Trobriand, the Negri-Sembilan Malay, the Ifugao, etc.

The Ashanti type. The ideal co-residential type consists of a man with either his wife or his sister. The function of line B is much stronger than that of line A. This type is found among the Ashanti, the Cocoanda Tonga, the Bagandan, the Trobriand, the Nayar of North Malabar, etc.

In terms of the strong function of both lines A and B, both the Garo type and the Nayar type may fall into a similar category. But as already explained, their structure basically differs from one another, and clearly appears as the counter schemes of different residential arrangements. The Nayar type shares with the Khasi a rather similar structure in terms of a descent group equated with a property group, while in the Garo type the two lines A and B of a single descent group never form an independent property unit.

If, leaving aside the Garo type, we consider the three others, the Nayar type appears again different from the rest in so far as in it, both lines fulfill an equally strong function, while in the Khasi and Ashanti types, one of the two lines is always more developed functionally than the other. The Nayar type presents the highest degree of descent group solidarity among the three. This Nayar situation might be compared with that of the traditional Chinese patrilineal system.[1] In both social systems the structural importance of marriage is minimized: the role of a spouse is only to ensure descendants of the matrilineal (patrilineal) group. The structural importance of a husband (wife) is almost neglected, while the wife (husband) holds the paramount locus in her (his) descent line. The descent group constitutes the strongest solidarity within itself, neglecting affinal relations with other groups. This principle results in the custom of the "visiting husband" in the matrilineal system, and, in the patrilineal system, in a total social shift of the wife by her complete assimilation into her husband's group, and separation from her descent group,—she has no social and personal independent locus in terms of the structure. It is an interesting fact that the most extreme scheme of highly institutionalized unilineal systems can be seen among societies of pre-industrialized high civilization. These schemes are structurally opposed to those of the systems of the equity

1. Fortes touches this point in his paper (Fortes, 1949, p. 108).

arrangement, such as the Garo and the Mundari, where both wife and husband keep important social positions as representatives of each descent group.

Leaving the Garo and the Nayar types, the following discussion deals with the implications of the difference between the Khasi type and the Ashanti type. The degree of function of the two lines *A* and *B*, is related to the residential arrangement. A household of the Khasi type includes the matrilineage women and either their husbands or brothers—brother's wives are excluded as a rule. A household of the Ashanti type includes the matrilineage men and either their wives or sisters—sister's husbands are excluded as a rule. Among the Khasi as I have already explained (p. 141), a woman and her brother's wife are never found as members of a common household, while among the Ashanti, as Fortes states, a man and his wife's brother are never found as members of a common household. In the former, since a woman is the centre of the matrilineage, her husband stands socially closer to her matrilineage than she does to his—the husband shares the matrilineage dwelling, while a man being a peripheral member, his wife is excluded as a rule from his matrilineage residence (hence predominantly matrilocal); the Ashanti type exemplifies exactly the opposite case (predominantly virilocal or avunculocal).

The crucial point on which lies the difference between the Khasi and Ashanti types is the rule of inheritance. In matrilineal systems, as a rule, the ancestral property is inherited by the matrilineal descent group. The starting point of the difference is really in the ways of inheritance of the acquired property particularly by the husband. So long as a man remains with his matrilineage members, both types show no difference. The crucial difference appears in the married life. In the Khasi type, if a man builds an independent house in which to live with his wife and children, that house and his acquired property during his marriage-life automatically belong to and are inherited by his wife and children. On the other hand, in the Ashanti type, if a man builds an independent house in which to live with his wife and children, that house and his acquired property belong as a rule to him and are inherited by his matrilineal group, not by his wife and children. In case of divorce or death of a spouse, the difference between the Khasi and the Ashanti types appears most clearly: in the former, it is the husband who leaves, and in the latter it is the wife and children who leave. Hence the residence pattern reflects

1. Among the Tiv-Goan group, which I classify into the Khasi type, a man's brother who is selected for the position of father of a second family takes his wife with him. This cultural marriage should be considered as an exceptional case applied to only such a particular member. Such special arrangement is also found among the Nayar where matrilocal arrangement is general rule.

19: Nakano E-5 (1955-1956) 1957 AR7 Khasi AR7 ◆
Gero AR5

these rules, as the Khasi type tends to a uxorilocal arrangement, while the Ashanti type tends to a virilocal or avunculocal arrangement.[1]

In the Khasi type, the residential arrangement is the decisive factor for a man's economic achievement. The men, though they keep close social and ritual ties with their matrilineage, are divorced economically from their matrilineal descent group.[2] On the other hand, in the Ashanti type, where the matrilineal rule is the decisive factor, men keep strong social, ritual and economic ties with their descent group at the expense of the women's and children's residential mobility. However, these women are not like men of the Khasi type; as among the Ashanti, women mostly go back to their matrilineage at a late stage of their married life. In the case of the Toubiands, the wife stays all her married life at her husband's house while her sons go back to his matrilineage, and her daughters leave for their husbands' house at their marriage. This can be considered as the exact opposite of what happens in the Khasi type. The matrilineage represented by men keeps its function and solidarity at the expense of the women. There, the female line (mother-daughter) is broken, in practice, by the residential arrangement; as was broken the male line (mother's brother-sister's son) in the Khasi type. The actual tie of the Toubiand wife to her matrilineage is maintained through the presents her brothers send her, not through mother, sister or daughter. That of the Khasi husband is maintained through his youngest sister or niece, not through his brother or nephew. Thus Toubiand wives and Khasi husbands are marginal members of the matrilineage. These facts show that they sacrifice either the male (*B*) or the female (*A*) line to the co-habitation of wife and husband. Unless they have a structural arrangement like that of the Gero, the co-residence of the married couple is the crucial factor which mobilize the matrilineal system.

The Ashanti manifest great mutability in this respect, since they do not like to sacrifice either line *A* or *B*, though actually line *A* is much weaker than *B*. The mother wishes to be with her daughter and son, while the mother's brother wishes to be with his sister's son, yet they do wish to have co-habitation in their marriage—combining (theoretically opposed) factors. This is also the case which I found among the Nayar in the transitional stage of the disintegra-

1. These arrangements do not mean that all members of a society act in the same way. In any society, considerable variations in residential pattern are found in individual cases. What is important here is the model, and the orientation of ideas of the people, the pattern of which is mostly followed by the majority of the people in a given society, at a given time.

2. Among the Khasi, though the authority of the male may have the account and manage his sister's property, his acquired property, though his wife's dowry or his independent economic activity, inevitably go to his wife and children.

tion of the matrilineal system (see Nakano, 1956B and 1960). In comparison with the Ashanti, the Khoi or the Tshiamo type gain considerable stability by sacrificing either A or B line, which is one of the possible ways of preserving the matrilineal system along with the practice of co-habitation of the married couple.

Another solution of the conflicting situation in such a society is the practice of cross-cousin marriage, as in the case of the Ashanti, which brings two conflicting factors together, the matrilineage and the family of procreation. In this case, the cross-cousin marriage tends to take place between the first cross-cousin centred around each man. Fortes states, "Cross-cousin marriage most often occurs between the children of full siblings or of uterine first cousins . . . cross-cousin marriage offers a possibility of reconciling the conflicting influences of conjugal, parental, and matrilineal kinship ties" (1950, p. 282). This is quite different from the cross-cousin marriage of the Gare, because among the latter, the cross-cousin marriage being practised on the basis of the whole structure of society, it makes no difference whether a cross-cousin is first or classificatory. In the case of the Ashanti and other matrilineal systems of a similar type, such as the Bayombe and the Kongo, it is considered more desirable to enter into a first cross-cousin marriage; classificatory cross-cousin marriage, such as among the Gare, does not make much sense. Moreover, the cases of cross-cousin marriage tend to take place among comparatively wealthy members in a society (see Buttenj, 1957 Chapter XXIX). If one has no property in the Ashanti type society, then cross-cousin marriage has not much meaning.

The cross-cousin marriage of matrilineal systems has been often referred to as being the solution to the conflicting situations of a man as a husband and as a brother. I suggest here that this can be applied to the matrilineal system of the Ashanti type, not to those of the Khoi type where men have already given up the role of forming the central core of the matrilineage. In these societies, the solution is already given through the sacrifice of one line. There are no conflicting economic factors, though men are still in a situation of social conflict between their matrilineage and family of procreation. This hypothesis is confirmed empirically by the fact that there are no generalized or preferential cross-cousin marriages among the Khoi, the Hopi, the Zuni, the Tsimo and the Nagri Sanskian Hebes,[1] where a man is not in economic conflict with his matrilineage and family of procreation. His explorers are already outside his economic

1. "In averaging marriages the preference is for someone 'near'. As cross-cousins are the nearest possible naturally a large number of them marriages occur. . . . This preference, however, is not explicitly institutionalized" (Leach, 1957 p. 136).

ceeds: due to matrilocal marriage, they have no right over his residence and his acquired property. Naturally the maternal uncle becomes far less important than in the Ashanti type.

Among the Yao, which I classified as belonging to the Khasi type, Mitchell states that in spite of the emphasis laid on cross-cousin marriage by his informants, real or classificatory cross-cousins are found in only 13 per cent of 103 first marriages (Mitchell, 1956, p. 200). The functional importance of cross-cousin marriage among the Yao is particularly evident in the minority (headmen of villages or lineages) who practice matrilocal marriage[1] in a society where a uxorilocal arrangement is the general rule; as in the case of the Ashanti, cross-cousin marriage functions as a solution to two conflicting tendencies: matrilocality and virilocality. The Todas, though they belong to the Ashanti type, demonstrate the same structural analogy to the Khasi type, though in reverse. Among Todas of cross-cousins there is no preference for cross-cousin marriage. The much discussed cross-cousin marriage of the Todas of Kotagiri should be considered as the exception, as has already been examined by Leach (1958, p. 139). In this regard the Yao and the Todas of Kotagiri produce a picture somewhat similar to the Ashanti type, among the minority of society, though the general practice bears similar features with that of the Khasi type.

It has become clear that cross-cousin marriage is closely related to the type of residence, i.e. virilocality, combined with economic factors. Furthermore, the cross-cousin marriage signifies the political importance of the maternal uncle as lineage head. Thus the Khasi type and the Ashanti type represent alternative arrangements to the different forms of the core of the functional body, the matrilineal descent group.

The preceding section has made clear different types of matrilineal systems so far as the internal structure of the descent group is concerned. This section deals with the relation of the descent group to the external organization.

Both the Garo and the Khasi follow a uxorilocal system, but they do not have what is called "segmentary lineage" organization, which has been much discussed in the African field. As generally understood,

1. Naturally never among the Yao-Cewa group, a cross-cousin marriage is likely to be found between a daughter of a head (male) of a descent group and his sister's son (Ashanti, type, p. 222). Mitchell states that Yao cross-cousin marriage is one of the solutions for the conflict between the principle of uxorilocal marriage and the principle of male leadership of the lineage (Mitchell, 1956, p. 194).

19: Nakao E-5 (1955-1956) 1957 AR7 Khasi AR7 •
Garo AR5

lineage is a corporate unilineal descent group of which the members can establish demonstrable genealogical relationships to each other. According to Firth, "lineage is essentially a unilineal descent group with some corporate functions, normally related by segmentary process to other descent groups of the same type, and with them usually covering the entire society" (1957, p. 4). The Garo and the Khasi can then be said to have the lineage, but to lack its segmentary organization which normally is found in a unilineal society. Both social structures exemplify the importance of the residence as a functional unit, against the wider descent group which may be called the lineage group.

In the case of the Garo, the localized lineage is expressed in terms of the village (or group of villages) whose land bears the name of the localized lineage. However, it is the village which acts as the functional corporate body, the economic and ritual unit, not the group of members of the localized lineage. The village theoretically consists of the members of the two localized lineages, as represented in the headman and his wife respectively. Practically, though it bears the name of a particular lineage to which the wife of the headman belongs, as also usually the majority of the inhabitants, it includes many other lineage members as well as the traditional two lineages. Therefore, the lineage is not, in this sense, an exclusive corporate unit with a ritual and economic function, though it gives a theoretical framework to the structure.

In the case of the Khasi, the lineage is found only on a household scale, centred in the woman, the property owner with members having direct matrilineal kinship ties to the former, such as her brothers, other sisters, sons and daughters, who may or may not reside in the same household—the members of the *iing*. Beyond this unit (the *iing*) one can hardly find any functional organization based on the descent system. In other words, the lineage becomes a functional unit only at the level of the household, e.g., the lowest level of segmentation of the descent group, and it lacks wider external organization by the same principle. The clan is considered rather as a ritual conception implying exogamy, not as an organized body of kin.

These phenomena contrast sharply with the Hopi and the Ashanti social organization, where lineage organization has crucial importance wider than on a household level. Many factors can be considered in this connection. First of all, the locus of property and economical unit are the most distinctive factors. Among the Khasi, property and economical units are always found in an *iing*, represented by the youngest daughter's household, while that of the Hopi and the Ashanti are in a wider lineage organization in which members of many households are usually included. The Zuni pattern seems also similar to that of the Khasi. The difference between the Khasi and Zuni lies

13: Nakano K-5 (1955-1956) 1967 AR7 Khasi AR7
Garo AR5

K
9
175
182

615

in the rule of inheritance, the former follows uxipatrilineal (ultimogeniture), while the latter does not. Therefore, the number of members of a Zuni household is naturally larger than that of the Khasi.[1] Against the average number of a Khasi household, four to five, that of the Zuni is seven and a half to eight persons (Kroeber, 1917, p. 104). Among the Khasi, sisters separate through marriage in every generation, leaving the youngest in their natal house, while Zuni sisters may stay together even after their marriages. Kroeber states:

> "The house belongs to the women born of the family. They come into the world, pass their lives, and within the walls they die . . . Now and then a new dwelling may be built by all the inmates, or by a girl of the house by an enterprising husband but in general the same walls, or rooms[1] same on the same spot (ibid., pp. 47-48). . . . It is true that a Zuni 'house' often contains what we should regard as two or three households, but as long as it includes only one used hearth, and all natives insist that the two or three households are a single one" (ibid., p. 104).

The internal composition of the household may differ from that of the Khasi, but the household in terms of the important institutionalized unit, is very similar to the Khasi. Li An-che states that "characteristics of a joint household based on the kinship principle stand out very strikingly" (Li, 1937, p. 77). Eggan's statement brings Zuni social organization much closer to the issue. He writes, "In terms of Kroeber's table it would seem that the Zuni tend to equate a lineage with a household, except in cases of recent expansion or budding off" (Eggan, 1950, p. 184). He gives a further illuminating analysis of this point:

> "We have noted that the lineage principle . . . also provides a mechanism for the inheritance of ceremonial duties and obligations and the transmission and preservation of fetishes and other ceremonial paraphernalia. In Zuni this inheritance is phrased in terms of the household, but it is clear that it is the lineage segment born into the household that is important. This lineage segment, or at least the female line thereof, also owns land and holds it in trust for succeeding generations, to be worked by the men who marry into the household" (ibid., p. 217).

Another similar equation of lineage and household, comparable to that of the Khasi and the Zuni, is found among the Trobriand. According to Goodenough (1956)

> 1. This involves not only the difference of the number of members in a household but also the relation between the members of a descent group. As already discussed, the core of the descent group among the Khasi, is the pair of siblings, the owner of the property (the youngest sister) and the authority (a brother), not the sibling group altogether (see p. 131) as happens in other matrilineal systems appearing in this discussion. In regard to the uxipatrilineal succession (ibid.), the Garo share the same system as the Khasi, though it appears to operate differently by reason of the structural difference of organization.

19: Nakane K-9 (1955-1956) 1967 AR7 Khasi AR7 •
Garo AR5

"In aboriginal times they used to be associated with most lineages a dwelling house, *jawa* (p. 93) . . . *jawa* is the corporate property of the lineage or descent line whose women live in it, but it is normally built by their husbands" (p. 68).

K

615

Here, it is clear that a household provides the major locus of a lineage. In other words, a lineage is a corporate property group with a common residence. This is also the case of the Nayar *tarwad* and the Minangkabau *jawa*, though in these cases the household excludes the spouses of its members, while with the Khasi, the Zuni, and the Trobriand the spouses (in most cases, the husbands) share the residence.

Though they may differ in scale and size from one society to another, as well as from one household to another, the functional lineage founded upon residence has thus a similar range in all of these systems. For convenience sake, I tentatively term this type of lineage "household-lineage,"[1] as opposed to that of the Hopi and the Ashanti, which might be termed "segmentary-lineage."

The average number of Khasi and Garo household members is four to five, that of the Zuni seven and a half to eight as stated above, the Trobriand is eighteen (three to thirty-four in Romonum Island, according to Goodenough), while the Nayar range from thirty to two hundred. These differences, I think, mostly depend on the economic (and environmental) situation; they should not be regarded as structural, except for the Garo and the Khasi, which, because of the uxorilocal rule, have smaller and fairly uniform households. The wide range of variation in composition which we observe among the Trobriand and the Nayar is due in reality to economic and environmental factors: the more favorable the circumstances, the larger the unit.

The co-residential group and the property unit do not always necessarily correspond. One property group may consist of more than two independent residences. But even in such cases, the lineage is likely to be found in a group which formed a co-residential unit in the recent past, and which should be considered as marginal cases, derived from the recent fission of a group—it is a lineage in process of fission not a constant kin-group based on wider organization such as we find among the Ashanti and the Hopi. Usually such a lineage ceases to function shortly after it loses its common property, which usually follows closely upon the fission of the residential unit. Thus, in the course of time a once-recognized lineage group disappears into the common sea of the clan, which represents only a ritual and exogamous unit. In some cases, even this clan loses its function, as happens among the Nayar and the Minangkabau, where the lineage which

1. It should be noted that it does not mean that the lineage consists of household members, but that the lineage solidarity is found around the range of a household scale.

15: Nakane E-9 (1955-1956) 1967 AR? Khasi AR? Garo AR5

E 9 191 182 592 619 000

corresponds (or corresponded in the near past) to the co-residential property-group itself becomes an exogamic unit, disregarding the wider unit of the clan. Structurally it can be said that in these societies a lineage cannot exercise its full function unless it has a common residence based on a property unit.

In contrast to these societies, I cannot help but think that the Ashanti and the Hopi belong to a different type. Both Fortes and Eggan lay great emphasis on the descent principle, based on the ethnographic data of the Ashanti and of the Hopi respectively. The best examples of statements concerning this issue are the accounts in which both stress their disagreement with Kroeber's argument of 1938 in favour of the priority of local residence relationships over those of descent, under the title of "Basic and secondary patterns of social structure."

Fortes states:

"A lineage cannot easily act as a corporate group if its members can never get together for the conduct of their affairs. It is not surprising therefore to find that the lineage in African societies is generally locally anchored, but it is not necessarily territorially compact or exclusive. A compact enclave may be enough to act as the local centre for a group that is widely dispersed. I think it would be agreed that lineage and locality are independently variable and how they interact depends on other factors in the social structure. As I interpret the evidence, local ties are of secondary significance, pace Kroeber, for local ties do not appear to give rise to structural bonds in and of themselves. There must be common political or kinship or economic or ritual interests for structural bonds to emerge. Agnatic spatial dispersion does not immediately put an end to lineage ties as the corresponding ties are found in exogamic systems like that of the Lele. For legal status, property, office and cult are contingently to hold dispersed lineages together and scattered kindred" (Fortes, 1953, p. 30).

Eggan states:

"For the Hopi the kinship structure is centered primarily around the lineage; the household relationships are secondary (Eggan, supra, p. 163) . . .

"Furthermore, it is the lineage and clan, rather than the household group, which is interwoven with lands and ceremonies and which is considered to own the house itself. Important as are the ties of residence and subsistence associations, they are not the key groupings in Hopi orientation—or in terms of our interpretation.

"Kroeber explicitly leaves kinship out of account in his analysis of 'basic and secondary patterns of social structure,' but in a sense kinship is more fundamental than either patterns of residence or formal grouping. The analysis of Hopi kinship has suggested that both the household and the lineage organizations are encompassed in the kinship system. And it is clear that the kinship system is organized in terms of the lineage principle rather than in terms of residence" (ibid., p. 193).

These arguments seem to me to refer more to a difference of social organization than to a theoretical contrast. On the basis of my own

field work as well as on the accounts of various matrilineal systems, I feel strongly that there must be different types of systems which may be distinguished as "household-lineage" and "segmentary-lineage". Forde and Eggan postulate the pre-eminence of the descent principle over residence. Though this may be the case among the Ashanti and the Hopi, it does not fit the cases belonging to what I call "household-lineage" type. Firth's argument emphasizing the importance of rights to group membership being associated with locality, fits very well with the latter case. With more precision and subtlety than Kroeber, he argues that "residence by itself does not give title to descent-group membership, but land rights established by descent-group membership tend to remain operational only through residence" (Firth 1957, p. 7).

I believe there are crucial differences between these household-lineage type and segmentary-lineage type organizations. The technical process of fission into segments is similar in both types. But in the latter, once a segmented group attains autonomy, the relation between the segments will easily be forgotten after a few generations, so it has no significant social implication. Among these societies, people's genealogical memory outside the residential group is surprisingly poor. This empirical fact also suggests a different structure from that of the segmentary system.

In both types of society the internal organization of a household is the same, but it differs externally. Eggan states that "Kroeber's and Parsons' statements about the lack of system in regard to Zuni kinship indicate judgement from some arbitrary standard" and adds "The concept of the lineage provides a bridge between the household and the clan" (Eggan, *ibid.*, p. 197). I cannot agree with this. In fact, my study of the Garo, the Khasi and the Nayar corresponds very well to the Zuni situation described by Kroeber and Parsons. There are matrilineal systems which lack a bridge between the household and the clan.

Then what is it that makes the difference between the two types of organization in similar unilineal systems? I am not sure that I can produce at present effective hypotheses on this issue. However, empirical facts show that the household-lineage type organization is likely to be found among more complicated societies or in a society with considerable mobility. This we gather also if we compare the village compositions of the Hopi and the Zuni. In the case of the Khasi, we saw that there was considerable mobility in population even in remote villages, so that we easily understand that in such a condition lineage membership hardly maintained itself. This seems to agree with the view put forth by Forde on segmentary systems. Forde says the limits of the spread or span of internal segmentation of the

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

has a striking resemblance to that of the Hopi as described by Eggan. The lineage, having segmentary structure, performs strong functions as a land ownership and religious unit. However, from Rattray's account, we understand that all grandchildren of matrilineage as well as children through the male line, are called *nana*, a term which is also applied to grandparent's generation. This means that the local classification does not extend beyond the second generation from Ego; such a classification corresponds to the *Zuni* type, but not to the Hopi type.

Coming back to the discussion of the correlation between the restricted type of kinship terminology and household-lineage, we should consider another important aspect of its bilateral character. In these societies can be observed considerable bilateral tendencies reaching beyond the household-lineage. As I have made clear in the description of the Khasi, the social and economic relationship with outside members of the household are no different towards people who belong to the same descent or clan than towards those who belong to an entirely different kin-group, except as concerns directly related kindred, such as sibling and mother and children. The matrilineal group wider than the *ing* has no exclusive function at all except avoidance of marriage. In this level of organization, there is no extension of the organizing principle of the matrilineal descent system. For instance, households A, B and C are matrilineally related to each other (A is the original and B and C the outcome of the fission of A). Such matrilineal links have no exclusive features that mark them off from other households unrelated through the matrilineal descent line; actual matrilineal links are minimized in their value and function in regard to relations between households. Such characteristics of this kind of organization must be correlated with the existence of an inheritance case, in which the matrilineal rule is distorted as I mentioned elsewhere (p. 121). If there is no daughter to succeed the *ing*, the son can inherit the acquired property of the *ing*, thus creating by transmission of the property, an entirely new *ing* (of his wife), in which no matrilineal link is established. Likewise in Truk, a son is the potential heir of his father's lineage, and frequency of patrilineal arrangements as alternatives—transmission of the property on the establishment of a new property-conferred group—does not always follow the strict matrilineal line. These facts point to considerable bilateral characteristics outside the household. The relationships among households are not organized upon the matrilineal principle.

Kroeber's emphasis on the bilateral character of the *Zuni* society should be regarded as important in this respect. *

*Upon her (Zuni woman) permanent occupancy of the house rests the matrilineal custom of the tribe. But kinship is thoroughly and equally bila-

15: Nakane E-5 (1955-1956) 1967 AR? Khasi AR?

Such variety in residential arrangements and such flexibility in inheritance rule complicates considerably the composition of the residential unit when a property group (residential domestic unit) grows. Richards gives an interesting illustrative description of the formation of a Bemba residential unit:

> "The Bemba bridegroom starts his married life as a stranger in his wife's village, but since his daughters remain with him for some years after marriage he builds up a grand-family composed of his daughters, their husbands, and their children. In some cases he is able to persuade his sons-in-law to remain permanently with him, while in others he is even able to keep his son in his own village. In time some of his sister's sons, with their wives, will choose to come and settle with him, so that he will be head of a group of rather heterogeneous composition" (Richards, ibid., p. 107).

Here we find a man's wife's matrilineal kin (his daughters and sons, including the daughters' descendants); his own matrilineal kin (his sisters' sons); and the third matrilineal sets (his sons' wives and his sister's sons' wives). Such a mixed composition of a residential unit may never be found among societies belonging to those types previously discussed; such residential composition would be impossible if the matrilineal principle was functioning strongly in the structure of the actual property group.

Thus, the Bemba type presents an outstanding structural difference from the other types of matrilineal systems in which the matrilineal inheritance rule was the decisive factor for the formation of the residence unit. It is clear that in the Bemba type, both a man and a woman are fairly free from the economic control of his and her matrilineal group, and their relations are somewhat like those of the husband of the Khasi type and the wife of the Ashanti type. Therefore, the conflicts between one's matrilineal group and family of procreation are minimized, particularly in the economic sphere.

This analysis throws much light on the following remarks of Richards bearing on different aspects of the similar formation of descent groups among the Yao and the Bemba.

> "The head of a Yao village of this sort (taking his wife to his matrilineage residence) thus has authority over his wife's children and over those of his sisters, but the position of the wife's children seems to be clearly differentiated from that of the sister's children, and Mitchell speaks of a traditional hostility between them. I never saw evidence of such hostility in Bemba villages, which also often contain a man's children and his sister's children" (Richards, ibid., p. 109).

This difference should really be ascribed to the structural difference between the Khasi type (the Yao) and the Bemba type. In the former the matrilineal structural force is strongly functioning in the residential group, whereas in the latter it is minimized.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7 *
Garo AR5

Within such a structural framework it is quite understandable that the predominance of virilocal arrangements, coupled with male authority as husband/father, are found. All observers of these societies have noted this feature. Among the plateau Tonga and the Bemba particularly, male authority is outstanding.

"Men are free to move and to form their own homesteads because they acquire rights over their wives which permit them to remove their women from the protection of their kin . . . . As head of the household, the husband occupies a position comparable in many respects to that which falls to men in patrilineal societies" (Colson, 1958, p. 61).

"With the marriage the husband obtains—but only for the probationary period—rights over his wife's labour, the right to control her movements, and rights to her sexually. He is the father of any children born to her, whether or not he begets them . . ." (ibid., p. 101).

"So long as the household contains a married couple, it is theoretically under the authority of the husband. The wife and her children form the house, the *ingenda*, but the husband is known as the *ingenda*, 'the owner of the house' . . ." (ibid., p. 103).

"Once the young man is admitted to the family he is free to move his wife and children to his own village should he desire to do so" (Richards, ibid., p. 103).

"This is a male dominant society and, even though descent is reckoned through the mother, the wife is very much under the control of her husband even while he is an outsider in his wife's village" (ibid., p. 183).

The husband/father's authority was also observed among other matrilineal systems under certain conditions, as already fully discussed in the chapters on the Garo and the Khasi, and more predominantly among societies of the Ashanti type where the residential pattern was virilocal. However, the ambilateral structure on the level of the household composition may give more opportunity to create a husband/father authority of a more stable kind, unhampered by matrilineal force.

Furthermore, individuals are almost free from the descent principle in establishing their residence. Colson states in her account on the Tonga that a man has complete freedom to choose his residence, and residents in a single neighbourhood need not have kinship ties with one another. In the ordinary round of daily life, membership within a neighbourhood may be of more significance than membership within a matrilineal group (Colson, 1958, pp. 27-28). Oliver describes a similar situation:

"The non-marrying women and their children acquire provisional rights in trusts where they reside, and ultimately acquire full title to such lands" (Oliver, 1955, p. 110).

It is clear, in these societies, that there are two sets of groups on different levels: a matrilineal group membership of which is acquired

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7 *
Garo AR5

000 devices of the existing system. This does not necessarily imply that such societies have or had the same organization as other matrilineal societies, but I believe this to be an economic and historical product of the existing structure. I do not question the fact that all these societies are subject to a process of change; but it does seem unnecessary to assume that every factor which happens to be missing nowadays, did, in fact, exist in the past.

R 9 170 * 182 611 000

Summing up the above discussion, the essential structural differences between the Bemba type and other matrilineal systems are found firstly in the internal structure of its property group: "unilateral" contrasting with the "matrilineal" of the Garo, Nayar, Khasi and Ashanti types. Secondly, in the structure of the wider organization of the residential groups: the clear matrilineal principle is found to act in the composition of matrilineal groups. The focus of the matrilineal operation is quite opposite to that of the household-lineage type. In the latter the bilateral features are met with at the wider organizational level. In the Bemba type, in spite of bilateral features in the composition of the residential property group, the rigorous matrilineal group conception is found in the wider organization. Unlike the case of the segmentary-lineage type, this matrilineal group does not have necessarily a direct and actual economic basis. Perhaps the scale of the Bemba society is small enough to maintain the matrilineal social system without a definite economic basis.

In conclusion, such terms as "matrilineal" (unilineal) and "bilateral" are simply convenient labels for the preliminary classification; they should not be used as contrasting criteria for classifying social structure. The unilineal principle (matrilineal system) works differently in each given society, producing as I have observed different structures. Again, *descent* principle and *residence* (with landholdings or property) are equally important criteria for the analysis of social organization. The prominence of either descent or residence should not be theoretically opposed in the arguments of anthropologists, for different degrees and levels of both factors are involved in each given society.

R 9 171 171 182 611

Finally I should like to note that the five major types of matrilineal systems in relation to the internal structure of the property group, which I presented in this discussion, namely the Garo, the Nayar, the Khasi, the Ashanti and the Bemba types, give theoretical criteria for the analysis. It should not be assumed that all matrilineal systems grouped into the same type present the same structure, but that each possesses the important basic element of its type. Also a system may change from one type to another through important economic changes or migrations: for instance, from the Nayar type to the Ashanti type, or from the Ashanti type to the Bemba type.

people remained non-Hindu in their basic beliefs and social customs. Hindu influences are nevertheless predominant in their culture, especially in their way of living which shows a practical adaptability, somewhat similar to the Japanese acceptance of modern western culture without becoming Christian. In my census of Shella village, the people calling themselves 'Hindu' amount to 91 per cent of the total, but they are the recent converts to the Ramakrishna School which established a missionary station at Shella after the Partition. The Christians constitute 9 per cent of the total, most of them having been converted during the last ten years, as in the case of the Ramakrishna School.[7] The rest remain as they were, of Khasi belief. Those conversions to either Ramakrishna or Christianity seem to have been encouraged by the unstable situation of the people resulting from the recent economic depression in this area.

The Partition of India and Pakistan in August 1947, which drew the boundaries a few miles south of Shella village, considerably upset village economy by stopping all trade with Dawgan, though a limited amount of trade is allowed with local people at the border. Because of this political change, all the produce of Shella gardens is rotting away for lack of markets, while all of the rice fields were taken by Pakistan. Goods are come to Shella only from the uplands, carried upon men's shoulders over the most difficult pass, which makes everything very expensive. Many families have sold their gold and other treasures, and some families are facing starvation.[8]

Concerning the conversion to a new religion, an interesting phenomenon is to be observed. The conversion to Christianity or to Ramakrishna is mostly by individual. I found in my census that the wife and husband often belong to different religions. This is a very different picture from the Garo, among whom I always found that the husband and wife belonged to the same religion, the conversion of the husband to Christianity was always followed by that of the wife. I think this reflects the structural difference which influences the actual relationship between the husband and wife. Among these Khasi, instead of the husband and wife, the maternal uncle and his nephews and nieces are mostly of the same religion. The function of the sing, the most important social and religious unit, thus appears also in the conversion to a new religion, stronger than that of a domestic unit.

Intermarriage

The close economic and cultural contact of the Shella people and the Dawgan is not matched by social contact. The essential barrier between the two peoples is the difference of religion which dominates the entire social order in each society. Though these Khasi were important traders, richer than the neighbouring Hindu peasants, they were considered by the Hindu as outcasts with whom they never shared social activities. Intermarriages were therefore very rare. In Shella village, only two exceptional cases were found in my census:

- A Khasi woman married to a Garhia (cattle-keeper), they live at Shella Bazaar (Shella).
- A Khasi woman has marital relation with a Dawgan medical doctor who has resided at Dawgan in Shella for six years. He already has a Dawgan

1. These two entirely different missionary activities are competing with each other, and are somewhat related to the political power within that area.

2. The state government is doing its best to provide them with additional facilities for example, providing an transport for the transportation of oranges from Shella to Gauhati and Calcutta. However, such arrangements cannot cover the great economic loss suffered by the Shella people.

workers and they were few in number.[1] They were particularly employed for such work as the clearing of jungle for new pan gardens in summer.

In the orange season (December to February) the number of workers increased and they were paid more: Rs. 1.8 were paid[2] for one load (one person carrying 80 pounds of oranges, from an orange garden to the railway station—about two miles). Usually a worker made three to five trips a day. Many workers from Jaintia used to come for this particular season.

Semi-permanent workers were engaged for wet rice fields. They were usually Hindu cultivators since these Khasi and other tribes do not know the technique of wet cultivation, plains people like the the Biharee immigrants were engaged. These workers were provided with servants' quarters where they lived with their wives and children. However, very few Jaintiaga households possessed rice fields.

The economic prosperity of Jaintiaga reached its climax during the period from 1939 to 1941. Since 1941, the orange production has been decreasing. In 1942, a serious disease attacked the orange gardens as well as the pan leaf gardens. Besides, by depriving Jaintiaga, as it had Shella, of their most important markets, Dacca and Sylhet, the Partition of India and Pakistan in 1947 caused a serious economic depression in the whole region. On the other hand, because of the past prosperity, the population has rapidly increased during the last ten years. The serious economic condition of Jaintiaga is illustrated in the petition which was submitted by the Jaintiaga people when the Governor of Assam visited there once in January 1956. It runs thus:

"Since the last ten years or so, with the increase of population in the village and with the loss of fertility of the soil, the people were faced with economic depression. At present they are facing more shortage of land they have also no scope to adopt other forms of cultivation like jhuming and wet rice cultivation, etc. Moreover, there has been successive attack of Bright's disease which destroyed and wiped out all the orange and pan gardens. And as such, majority of the families have to depend for their livelihood on daily wages.

It is indeed a serious situation for them, because the Khasi do not produce staple foods, such as rice, their economy is completely dependent on the trade of their products by which they purchase their main provisions, clothes, etc. Other people round Jaintiaga, being from cultivators, can at least get rice and cotton: the minimum requirements, staple foods and clothing are available even in the worst conditions, so that they can at least maintain themselves though the standard of living is low. As I stated before, a few households in Jaintiaga possessed rice fields, but the majority had none. Recently they rented some plots of jhum field for rice cultivation from Zemi-Naga of neighbouring villages.* However, its yield was but a small percentage of their consumption. A few

* If they had worked in the gardens of Jaintiaga, they might have got more profit than from their own jhum fields. For one day's labour, they got Rs. 2/-. For one month, they could earn Rs. 12 with which they could buy about 2.5 maunds of rice (one maunds paddy cost Rs. 5/-). For one year it became 30 maunds, which was impossible to produce in a jhum field by a single person's labour.

1. These notes, including the figures of note 1, apply to 1956.
2. Jaintiaga villagers said one that Zemi-Naga were kind enough to lend them their field for a negligible rent, though they had not enough for themselves. Zemi-Naga said that they owed much to Jaintiaga in the past, so that now they sympathized with the conditions of Jaintiaga, and offered some parts of their jhum field.

15: Nakane E-5 (1955-1956) 1967 AR? Khasi AR?

192 434 very wealthy households still maintain their former economic activities, but the majority have been impoverished, becoming daily labourers for the wealthy men or for road construction. Thus considerable internal economic differentiation has begun to appear in the community.

192 245 648 Though the recent economic depression brought poverty to Jaitinga, the standard of living is still strikingly higher than that of neighbouring tribes. Studying such economic aspects of Jaitinga, I wondered at first why these neighbouring tribes have remained as they were, except for temporary employment at Jaitinga; why, looking at the prosperity of Jaitinga, they did not adopt the way of the Jaitinga people?

Indeed some of them attempted to imitate the Jaitinga economy, but the results were unfortunately not favourable to them. First, both pan-leaf and orange cultivations were entirely new to the tribal people, and the technique was quite different from that of dry rice cultivation in the jhum field. Pan cultivation requires very delicate care which is almost impossible to manage for people who have been accustomed to the primitive jhuming cultivation. For instance, when they go into pan gardens, they have to wash themselves and put on special clean clothes in order to prevent the spread of epidemic leaf disease. Tribal people, who seldom wash their clothes, or mostly go naked, could hardly keep pan gardens. In this respect the Khasi are entirely different, having specialized in this economy for a long period, even as they believe, from time immemorial.

On the other hand, the technique of orange cultivation is much easier than that of pan-leaf, but it takes several years to obtain a yield, it requires considerable capital to begin with. For the jhum cultivators, who usually did not have such income nor funds, it was almost impossible to start it, while the Khasi were able to raise funds from the selling of the pan-leaf. Furthermore, the management of such gardens, either pan-leaf or orange, differs also from that of the jhum field as it entirely depends on individual enterprise based on private land ownership, which is new for these tribes where the community owns the land. Therefore the possibility of starting orange gardens is restricted to special individuals among them belonging to exceptionally rich and powerful households. A few households in neighbouring villages did, in fact, start orange gardens, adopting the technique of the Jaitinga people. The was sound vast and they were expecting to have the yield around 1950. However, unfortunately, when their oranges began to come into production, orange disease started in Jaitinga and spread all over these areas. Their dream therefore never came true.

[425] Besides oranges, some of them also established gardens of bananas, jackfruits, and papaya, which were more successful than the oranges. These plantations started much earlier than oranges in this area, though not in great quantity. The products were sold to the Jaitinga people who sold them again to Bengalee merchants. The question arises why were they not sold directly to Bengalee merchants, when the profit would have been much greater.

192 44 648 This aspect of the market economy touches upon very interesting problems concerning the relations between tribal and Hindu peoples. Such tribal peoples who live on a primitive subsistence level usually do not have direct contact with the peoples of the plains. There is always an intermediary between them. In this case it is the Jaitinga people who know both tribal life and Hindu life. They are also in between culturally. If a tribal cultivator sells his produce to a Hindu merchant, he would most certainly be cheated by the cunning merchant, as he is quite ignorant of trade. Tribal men do deal with markets directly, but only on a small scale at Shillong bazaar, and without making a profit; it is just the exchange of their basketful of jhum produce for an iron

15: Nakano E-5 (1955-1956) 1967 AR7 Khasi AR7

spade or some dried fish, etc. Products such as large quantities of fruits should be sold to the Jaintiya people who buy them at reasonable prices. 182 •

The Khasi are born traders. This must be closely related with their economic technique, such as pan cultivation which makes it impossible for them to live without trading. Hence, though they are hill people, they have had close economic contact with the peoples of the surrounding plains. At the same time, some of them have had a very similar economy to that of other tribes, such as that of Sohkhynrubh and of Kongkon; hence they are familiar with tribal economy. On the whole, their dealings with the tribes as well as with the plains peoples are fair, though they are hard bargainers. Indeed the Khasi are quite welcomed by both sides. Thus the Khasi play an important role as intermediary between the tribes living in the hills and the Hindu (and Muslim) living in the plains.[1] 44 646

The economic contact is the most important of the many contacts between Jaintiya and other tribal villages. Social contact, as appeared in intermarriages, is a rather marginal matter for the total population. Cultural contact is negligible. I only observed one infiltration—some fashionable tribal girls sometimes wear Khasi women's dress when they go to the Hafleng bazaar. In their contact with tribes, the Jaintiya Khasi speak Hindi which is the common language at Hafleng bazaar for all tribes and peoples in this area. A few men of Jaintiya speak some tribal language, but none of the tribal speak the Khasi language. 645 182 [191]

In spite of such great differences in culture, economy and social organization, the relationship between the Jaintiya people and the tribes has remained very friendly. For instance, as I mentioned before (p. 175, note 3), the tribes lent their land to Jaintiya people who were suffering from a great economic depression. Their actual behaviour also reflects such a friendly relationship. It is said that at the time of the Golden Jubilee of Jaintiya in November 1955, many Zemi-Naga, Kuki, and Cachareo came and performed their dance for the celebration.

1. The important role of the Khasi as intermediary is not only in the economic field, but also in the political and cultural fields: nowadays many Khasi officers are sent to tribal areas by the Government. They are very efficient in dealing with such work, because they are used to deal with both tribal and plain peoples.

[P. 178 is blank]

potable water supply. Villages are about two to five miles apart, and have no boundary markers. In the past, villages contained semipublic buildings and grounds: the home of the village priest (also the home of a chief if he resided in that village), the village marketplace, and tree groves, cremation grounds, or other awesome spots that were believed to be inhabited by supernatural beings. Villages today may have also one or more Christian churches, government social welfare buildings, and schools. Formerly, villages were entered through a guarded gateway; this is no longer the case, and paths feed into villages from all directions. Often several villages are nucleated into one large unit, named and also described as a "village." These were once defense units, but were so uncohesive otherwise that institutionalized rivalry obtained among the component villages. Now, they have been integrated through the agency of all-village public services, especially schools. **Housing.** The traditional Khasi house is entered through a door at the rounded end of a U-shaped ground plan, and is about 20 feet at widest extent; it is about 30 feet deep, and is elliptical or hogback in profile. Its walls are of stone blocks cemented with mud. The roof of grass thatch, supported by a bamboo frame, overhangs the walls on their outside, down to about three feet above the ground. The house is divided into two parts: the front one-third is on the ground level, floored either with stone blocks or tamped earth, and is used for storage of occupational instruments and as a shelter for poultry. The rear two-thirds is raised four feet on piles of stone blocks to a platform of planks, and is partitioned into six rooms, comprising a kitchen, areas for storage of food and water, and sleeping quarters. Furniture is minimal, and the house is totally undecorated. There are no windows, and no smoke vents. A house generally has a companion shed, walled of wood and grass matting and thatched with grass. This serves as a pigsty, but it may be partitioned also to house cows, and it may have a loft for fuel storage. Compounds often contain garden plots, and are fenced around with stone or bamboo and mud. Nowadays, the traditional house has given way to Western-style bungalows of wood and tin, especially in and around Shillong. [Cf. Mukherjee et al. 1941.]

361 [944] [443] [778] [344] [178] [712] [628] [178] [182] 342 352 353 354 343 351 177 184 342

ECONOMY. The Khasi economy is a market economy based on agriculture, and most Khasis are primary producers, sellers, middlemen, and/or providers of services in connection with markets. Khasis are often multioccupational: they produce goods for partial subsistence, and also play some part in trade. **Agriculture.** On the Shillong plateau, the major field crops are potatoes, maize, millets, and dry rice, still produced mostly through swidden farming, with a two- to three-year period of fallow, but increasingly through continuous use of a single field with the aid of ma-

Then followed the dance of the girls (*Ki shad I pyrkat*) who were also wearing dress as described above. They kept their eyes down, keeping their arms on their sides taking such a short steps with the music, that the movement of the feet were hardly perceptible. The boys were also in their dancing dress as worn by *nongshad* and danced with fly-brush round the girls making their steps with the beatings of the drums. The music started from the morning would be stopped only after completion of the dance which prolonged till evening. These functions served as a good source of amusement to the people, enabling them to have a good diversion from their monotonous life with an opportunity to meet their friends and relations who assembled there from different parts of the hill.

DISCUSSION

From the foregoing description, it is evident that the Khasi live in a democratic set up in which the secular duties are entrusted to the *Siem*. A different rule is followed in the case of religious festivals. Every Khasi family entrusts the sacerdotal work of the house to the youngest daughter. The *Siem's* sister (Siem Sad) being the senior member of his mother's clan, is made responsible for the observance of these ceremonies which concerns the welfare of the subjects. The people attend the festival to seek blessings of their supreme deity U Shillong and their presence in the *Siem's* residence indicates their loyalty to him. The rituals of the festival, instead of being performed by her (High Priestess), were conducted by the Chief Priest (Sub Siem) for which he was allotted a very important position in the celebration. The musicians were given similar status owing to the belief in the sacredness of their music. It ought to be played in proper tunes otherwise the displeasure of the deity would fall on them on finding any slight departure in this respect. For this reason, the music is considered as important as the rituals and the role of musicians were consequently given due recognition at every stage of the festival. The tradition of depositing one pieces of Nongrong (lit. to sacrifice the goat at the top of the hill was followed on account of their ancestors having carried out in olden times the profession of *ski-lawang* (body guard) to the *Siem*. Another person of Khariemen clan was also asked to carry the head of the sacrificial animal from the hill to the residence of the *Siem* after the worship, as his predecessors were such in ancient times during the period of their captivity in this State. Such attitudes were found expressed in a symbolic way through their ceremonies.

The most important concern of the people was to maintain their mode of living together with their property and other means of subsistence. They worshipped him so that he might prevent the evil spirit from doing any harm and may in addition grant them bumper crops. To be recipient of such a favour, they appeased their god U Shillong with gifts and sacrifices. It is not sure whether he is considered as one of their defined counterpart but his important position in the Khasi pantheon enabled him to have some priority in their worship. The offering of red-cock together with a yellow goat, moreover, revealed his amiable and benevolent nature as the malignant ones get representation invariably with black colours. U Shillong was invoked simultaneously with other dead ancestors, with this hope, that all the deities would pool their supernatural strength in fighting the evil spirits before the latter were able to cause any harm to their crops or to reduce in any way the fertility of their fields.

It would be interesting to refer here about the presentation of nine pieces of meat from various parts of the sacrificial animal. It may be a case of appeasement by serving him with some food but there seems to be something

6.6 It is significant that in all the three areas a considerable section of wholly agricultural families and families following agriculture as principal occupation are landless. On the other hand, a considerable proportion of the families with agriculture as subsidiary occupation or independent of agriculture had land of various sizes. The fact why agriculture for those families who possessed sufficient land, was relegated to a subsidiary occupation is possibly more due to low returns from agriculture than their attachment to it.

FRAGMENTATION

6.6 It has been observed that a large number of rural families have small holdings, the very smallness of which render their holdings uneconomic. In addition, the holding of rural families suffer most from the evils of fragmentation. Often holdings are not in compact blocks but are scattered all over and surrounded by lands in possession of others or some uncultivable waste land. Some of the fragments lie even in separate villages.

Unlike in the plains districts, fragmentation here was brought about not so much by population pressure (except only in case of wet paddy field) or inheritance legislations as each other factors as would give rise to extensive fragmentation of holdings. This is because there is no settlement regulation and the people are free to retain as much of the Raj land as possible for their cultivation. Fragmentation here is thus more a product of the topography of the district, for cultivable land in large compact block is not easy to get and cultivable land have to be found in isolated pockets.

The extent of fragmentation is presented in the following table :

vation is impossible because of the cold climate. In the past, Khasi economy must have remained at a very primitive stage.

Potato cultivation has been much encouraged along with the development of Shillong and the opening of the motor road to Gauhati from Shillong after the Independence of India when Shillong became the seat of the Assam Government, as well as the capital of the Khasi-Jaintia Hills. Shillong has become an important trading centre, where big merchants collect the harvests of potatoes in exchange for rice, clothes and various other goods from the Assam valley. These changes have introduced the Khasis into an active commercial economy which again has brought about various changes in their social life. Recently coal excavations have started in the upland Khasi Hills, and many Khasi become miners.

Thus the history of the Khasi Hills during the last hundred years has changed a great deal the picture of the Hills. However, dark corners still remain in Bhoi, War and in the area bordering on the Garo Hills. These have been kept in a vacuum between the Hindu civilization of the bordering plain and the modernization of the uplands centred in Shillong. In these areas, the people are still practising primitive jhum cultivation. I have chosen two villages in War located in one of these areas as subjects of my major field-work.

[P. 100 is blank]

Chapter III

VILLAGE COMMUNITY

As models of a Khasi village community, I have taken my data for the discussion presented in this chapter from two villages situated in the Kadashinong area, Sohkyndah and Kongkon, with comparative data from Sholla and Jotinga villages.

Sohkyndah and Kongkon are situated in one of the most secluded spots of the Khasi Hills and the economy is shifting cultivation, with millet as its main product. Only a few Christians are found; most of the population are pagans. Sholla is situated on the southern border of the Khasi Hills, adjacent to Pakistan. Jotinga is in the North Cachar Hills, surrounded by patrilineal tribes, such as the Zemi-Naga, the Kuki and the Cachares. The economy of both villages is pan-leaf and orange cultivation. In Sholla, Hindu, Christian and pagan are found among the villagers almost in the same proportions, while the Jotinga villagers are all Christian. The two Kadashinong villages, Sholla and Jotinga, differ from one another not only in their religious and economic aspects, but in overt culture, dialect and political organization as well. (Additional information concerning Sholla and Jotinga is given in Appendix.) Sholla and Jotinga are unique among Khasi villages and quite sophisticated, having been developed under a trading economy, with considerable contacts with other peoples, including Hindus. I selected these villages in order to ascertain how far the structural principle which operates in the Kadashinong villages can be found to act also in totally different economic and environmental situations.

[P. 101]

I. Setting and Economic Background of Sohkyndih and Kongton

361 Sohkyndih and Kongton are villages of the Kadashimong,[1] one of
632 the areas under the Cherra Chief. The Kadashimong is situated on
[191] the southern slope of the Khasi Hills, in what is called War country. These two villages are situated at the farthest point from both Shella, the centre bordered by the plain, and Cherrapunjee, the seat of the
• 194 Cherra Chief, one of the centres of the upland Khasi Hills. The people
121 at Cherrapunjee say that these villages are one of the most backward
[171] parts of the Khasi Hills. They correspond to Rombagiri in the Garo Hills, as they lie in the innermost parts and more traditional economic and social settings have been preserved there than in other villages. These are also the reasons why I selected these villages as my field.

361 It is nine miles to Sohkyndih from Cherrapunjee, crossing two
[191] deep valleys towards the east. Kongton is located at the heart of
[497] the mountain ranges, ten miles from Cherrapunjee, towards the north-east. It is about twelve miles from Sohkyndih to Kongton, and the way leads through one of the most difficult passes, where even
[162] villagers seldom travel. In December, 1955, Sohkyndih was a community of 48 households (List 6), and Kongton of 62 households (List 9). The settlements of both villages are clustered in the southern depressions of a mountain, not far from the summit, a typical location
[194] of Khasi villages. Sohkyndih has poor soil, covered with plenty of pieces of stones. The yield therefore is very poor. On the other hand, Kongton, a much older village, enjoys fertile soil, and is one of the most prosperous communities in the Kadashimong.

241 The major economy of both villages is shifting cultivation. We have already seen, in the chapters on the Garo, the fundamental technique of "jhuming cultivation." The differences between the
423 Garo and the Khasi shifting cultivation are to be found in two aspects:
[171] one is the nature of the crops and the other is the type of landowner-
[241] ship. In this area, the main crop is millet, while that of the Garo is rice. Besides the shifting cultivation, the Khasi have pan-leaf gardens and sometimes pineapple gardens, though on a small scale and not in every household. The most important feature of Khasi shifting cultivation is the development of private ownership. In the tribal areas in Assam, such private ownership of the jhum field is quite an

1. Kadashimong is the name of a group of villages. Its literal meaning is "twelve villages," and it comprises the following villages: Sohkyndih, Rymmai, Mawbawein, Mawshiot, Mawmang, Kongton, Shyntiang, Krohiawhiar, Pilei, Tenshon, Nongpriang, and Dienglaw. (Khasi spelling follows the customary usage in Cherra State.)

necessary. The chances of acquiring a piece of land nowadays are 175
small, except for very successful men, and usually the size of the plot
is only just enough to maintain one household. When this land is 423
passed on to the next generation, the youngest daughter will hold the 428
title to it. This fact tends to exclude married elder sisters from the
right to use the land, since it is not sufficient for more than one house-
hold. Thus the ultimogeniture succession rule seems to have developed
more sharply and to have encouraged limited inheritance in conjunc-
tion with the shortage of land.

This tendency creates imbalance in the economy of the households 175
within a community. It is a usual picture in Khasi villages, for the
bigger and well-built houses to be occupied by the youngest daughter's 184
family, while the elder sisters reside in poor huts. Youngest daughters 423
are usually landowners, while their elder sisters have often to become 428
day-labourers after their marriage, unless their husbands are capable 556
men, or their fathers wealthy enough to give them some share of their
acquired property. On the whole, the variations at present between [171]
rich and poor are considerable in a Khasi community, in comparison
with that of the Garo, where the economic conditions of each household
in a village is more or less similar. These differences are not only a
matter of economic organization but arise from the nature of each
social structure.

The economic and social patterns of Sohkynduh and Kongton are 197
very similar, but their dialects are slightly different: my interpreter, [124]
who came from Cherrapunji, could work quite well at Sohkynduh, but
at Kongton he found some difficulty, especially with the speech of
the old men, and with their religious expressions. The headman of
Kongton, who was quite accustomed to the Cherra dialect, acted as
an interpreter for us. Such differences in dialect in the Khasi Hills
are common phenomena; it is said that every valley has its own dialect.
Differences are found not only in speaking, but also, to a certain
extent, in culture and in social usages.

II. Village Exogamy

One of the outstanding features of Khasi social organization is 582
the predominant tendency of endogamy on the level of the village, 621
which contrasts with the structural orientation of the Garo village [171]
exogamy. This is closely connected with the distributions of clans
and the nature of the descent groups.

The Khasi population consists of a number of *kur*, matrilineal 614
clans, whose members consider themselves to be descended from a [765]
common ancestress. The members of the same *kur* have a common [769]

particular two families are not restricted to one, but may be accumulated two or three, though I omitted to indicate these in Fig. 10.

582
591
61
621
628

There are some extensions of marriage relations with members outside the village. In Sohkyndah, out of 88 (46 housewives and 42 their husbands) 13 men and 2 women came from neighbouring villages. Owing to the predominant uxorilocal arrangement, those who came in from outside the village were mostly men. By these members, five different *kur*, new to Sohkyndah, were found, as shown in List 7 (17-21). Most of these outsiders came from villages inside the Kadashiong, or villages no further than a day's journey there and back. This area might be called a secondary endogamous area, and includes more than half a dozen villages. In Kongton, 20 husbands and 3 women came from neighbouring villages by their marriages. The secondary endogamous areas of Kongton and of Sohkyndah are not the same but they overlap in certain places, the surrounding areas being centred on each village. There were, by December 1955, no instances of direct marriage between these two villages.

• 184
582
621
[795]

There are a few exceptions to local endogamy, such as those individuals who have become Christians and are educated in towns like Shillong or Cherrapunjee. They usually move to a town, seeking

19: Nakaso K-5 (1955-1956) 1967 AR7 Khasi AR7

some clerical work. However, such instances are very rare in these regions and few Christians are to be found among the people. So far as my genealogical table accounts for, only two boys from Sohkynduh, and one girl and one boy from Kongton, left for Shillong, and married there. In contrast to these exceptional cases in these villages, in the upland Khasi Hills, there are considerable changes in the composition of a village with high geographical and social mobility of population because of the spread of Christian education and urban influence.

194 •
582
621
[171]
[178]

The people of the two villages say that marriages with outside people were not formally practised, and were only a recent tendency. However, the composition of the population of the two villages showed extensive movements of population in the past (not to urban areas, but from village to village). Such movement is attributed mostly to migration by a family rather than by an individual on marriage. This type of migration is clearly found also in the process of the formation of Jatinga village (see Appendix, Jatinga).

166
178
582
621
[194]

The composition of the village community and the social characteristics of Sohkynduh and Kongton show very similar features of village endogamy. They seem to be typical of the traditional pattern of Khasi villages. Village endogamy is the intrinsic pattern among the Khasis. This fact can be also observed to a considerable degree in Shella and Jatinga.

582
621
184

[P. 116 is blank]

592 The Khasi domestic unit (co-residential group) can be divided into four categories:

a. Households consisting of wife, husband and their children, wife's unmarried sisters and brothers—sometimes including widowed or divorced.

[619] c. Households including all members of an *iing* (including their spouses from members of c). In this type, larger households contain all the descendants of three or more generations from one woman (in this case, an *iing* corresponds to a *kpoh*).

[591] b. Households of intermediate type between 1 and 2. Husbands are supposed to live in their wife's house, but they often go back to their sister's house for meals, and sometimes sleep there. They are supposed to work in their wife's field but they might work in their mother's (sister's) field, if necessary. This tendency is especially strong among newly married couples before they have a child.

e. Households consisting of only one elementary family. This mostly happens when a man married a non-farmer.

Most Khasi households are of types 1, 3 and 4 and these three types are usually found within one village. They were found in the four villages in which I worked. It is to these dwelling units that I have [178] given the name of house in Lists 6 and 9. Category 2, according to the information of Khasis and Jaintias, was used to be found among the Jaintias, though nowadays such cases are rapidly decreasing, changing into forms 1, 3 and 4. The members of category 2 belong to an *iing*, which structurally corresponds to the *tarwad* of the Nayar and the *parai* of the Minangkabau.

178 Category 2 may have been practised among certain of the Khasis a long time ago. Kongton people said that as recently as their father's • 184 generation, there were many husbands who stayed at the mother's 591 house after their marriage and visited the wife at night. Nowadays, visiting husbands are very unusual cases in the Khasi Hills, though such situations may occur among newly married couples before they have children. Gordon, who wrote his book *The Khasis* in 1914, states:

> "Amongst the Khasis, after one or two children are born, and if a married couple get on well together, the husband frequently removes his wife and family to a house she and her husband pool their earnings, which are expended for the support of the family" (p. 76).

In the Khasi Hills, the transition period between duolocal residence and neolocal or uxorilocal residence seems to have been shortened during the last forty or fifty years. This might have been effected through the influence of Christian marriages, which start cohabitation of the wife and the husband immediatly after the marriage ceremony. However, in Jatinga whose inhabitants originated in the Jaintia Hills where duolocal marriage is the usual practice, there are even now many instances of a man staying at his mother's house for several

years after his marriage. During this period he works in his wife's 178
field, then, if the couple gets on well, they start to live together in 184 •
an independent house (non-heiress's case) or in the wife's house
(heiress's case). In spite of the fact that the inhabitants are all
Christians, they have retained this custom.

It is difficult to determine at what date the Khasi people have 178
changed from duolocal marriage to uxorilocal marriage. However, 591
the present dwelling unit, with its fluid relationship between husband
and wife (in fact, there are many cases of category 3), suggests a situa-
tion linked with the duolocal residence pattern. The fragmentary
historical information available and the present Khasi residence pattern
suggest that the duolocal arrangement may be an older pattern of
marriage. When I was in Kongton there was no husband who stayed
at his mother's house permanently, visiting his wife at night. The
head man told me that, when he married, there were many who did
not stay in the wife's house. He was the first person to settle in the
wife's house. In his case, he said, he felt sympathy for his wife who
had no brother who could work for her. After he had settled in his
wife's house, many villagers began to follow his example.[1] When the [621]
pattern of a visiting marriage was in vogue, a village must have
constituted a more compact endogamous unit. If the husband's house
was in another village, a visiting marriage must have been a great
inconvenience. The tendency to settle in the wife's house and work
for the wife's house must have brought about a wider range of marriage
contracts, such as with members of nearby villages, even though in
the present form of marriage, village endogamy is much preferred as
it is decidedly advantageous particularly for a husband, since he can
continue his life in the same familiar environment in spite of uxori-
local marriage.

The variations in the pattern of co-residential grouping, which 592
I have classified into four categories, reflect two different themes in 599
the social structure of the Khasi. On the one hand they represent
different stages in the maturity of the individual families concerned. 613
For example, a householder who starts in category 3 or 4 may end as
an old man in category 1. On the other hand these variations also
reflect the polar opposition between the obligations of matrilineal
kinship and the obligations of parenthood; a man, in particular, has
conflicting obligations towards the *ing* of his sister and the *ing* of

1. However, all the information which I collected in the upland Khasi [184]
Hills indicates that the uxorilocal residence pattern has been practised for a
long time. According to stories often told by the Kongton people, they migrat-
ed from the Jaintia Hills. If these accounts are to be taken as a reflection of
the real history of their migration, it would seem that the Kongton people may
have kept up the Jaintia custom including the duolocal residence pattern up
to recent times, while the majority of the Khasi practised uxorilocal marriage.

whom he can marry, he has to endure one miserable family life, while 596
often in the same village his former wife is living in a well-built house 619
with her children and her matrilineal relatives as before. Households 596
of 3, 13 and 30 of Sohkyndah in List 6, and 23, 29, 38 and 58 of Rongiron 628
in List 5 are instances of such cases. It is really a pitiful picture to
see such a man, aged and poor, living all alone.

V. Marriage with the Non-heiress

Outsiders who come to the Khasi Hills are often impressed by the 184
Khasi husband's miserable status and express surprise at the high 628
divorce rate. This is mostly due to exaggeration based on the mar- 599
riage with the heiress. However, where a man marries a non-heiress,
there are many successful marriages with paternal authority. In most
of these cases a man's status as a husband and as a father is stable.
First of all, the domestic residential unit is an elementary family.
From the onset of the marriage the husband's labour is of great impor-
tance to his family, since a non-heiress usually has no economic
background, i.e., no dowry or inherited property (see p. 103). The
economic circumstances allow a man to be the *de facto* head even
though whatever he earns belongs, as a rule, to his wife. A man who
succeeds at the beginning of his married life is respected and honoured
as father in his family for the rest of his life. By this type of marriage,
the man's status is firmly established. It is therefore a more secure
form of marriage than a match with an heiress.

In such a marriage the children love and obey their father. The
management of his acquired property will be taken over by his son
and the property will be handed over to his daughter. Thus the
paternal authority is as well established in this form of domestic
family, as in a patrilineal family. However, the great difference from
a patrilineal case is that the husband/father status is not permanent
as the authority of the family. Theoretically he exercises it in the
absence of a male adult member of his wife's *iing* (actually founded [619]
by his contribution), in other words, till his son is grown up (see p. 16).
In the next generation this will form an established *iing* in which the
husband of his youngest daughter will suffer again.

The household of this kind of marriage with a non-heiress actually 592
enjoys a considerable degree of independence from the descent groups 599
of both wife and husband. If a man who has established a matri- 619
monial life independent of his wife's natal *iing*, is not the authority of
his natal *iing*, his relation with the latter usually becomes weaker.
Economic and residential factors make it possible for the men to make
the considerable shift from his *iing* to his wife's *iing*, and though

182 after divorce or husband's death, the Khasi woman stays on in her
586 household. Indeed many divorced or widowed poor wives, whose
619 children are still small, try their best to live and bring up their children
736 by themselves without asking their brothers' help. Of course a mother and her small children may go back to live in her natal *iing*. Such cases are found particularly when the woman's *iing* is rich. However, during my field work, I found no sense of psychological inferiority in Khasi women, widows or divorcees, such as we usually find in other societies. The personality of the individual seems to reflect the social structure.

182 Given such strong residential independence on the part of the
184 non-heiress, economically divorced from her descent group, and
586 oriented towards sociological separation from it, the husband's eco-
599 nomic and social contribution is handsomely rewarded by the estab-
619 lishment of a stable, happier, matrimonial life. In fact, as already mentioned, the divorce rate among such couples is very low contrasted with the high rate among marriages with heiresses. More accurately, I should say that divorce is more likely to occur among the latter owing to the conflict of loyalties towards spouse and *iing*. Therefore, when such partner has less loyalty towards his or her natal *iing*, the divorce cases become correspondingly fewer. Thus, among the Khasi, successful marriages are frequently found where there is branching off from an *iing*. And a new *iing* is always established by a husband's contribution.

182 Khasi men, who are well aware of this fact, prefer to marry a
184 non-heiress, since they will then form an independent household and
581 remain immune to pressure from their wife's kin. However, they say a poor or lazy man prefers marriage with an heiress. As Richards said of the matrilineal Central Bantus, the residence on marriage seems to be a most important index of the husband's status, though the determining factors of the residence of the Khasi differ from those of the Bantus (see p. 124).

182 In the case of marriage with an heiress, when the wife dies, the
184 husband usually returns to his *iing* (the youngest sister's house). But
587 in marriage with a non-heiress the husband often remains with his
599 children, if his children are not too small and he is not planning to
619 marry any woman other than his late wife's younger sister. If he
736 marries his wife's younger sister, he has the right to stay on. This kind of sororal marriage cannot take place in the case of a man married to an heiress, since a Khasi man is not allowed to marry the late wife's elder sister. This form of sororate is found among the Khasi, but the levirate is unknown, such as can be seen among the Ashanti and the Ila, where a man takes his late brother's wife. Among the Khasi, even if a widow happened to marry her late husband's

182
587

19: Nakao E-5 (1955-1956) 1957 AR? Khasi AR?

Thus, the marriage of a non-heiress and a man of authority also produces an unstable position for the husband in spite of his having an independent household. Therefore, the possibility of a really stable marriage is even more limited; it will occur only in the match of a non-heiress and a non-authority of the *sing*. But even these marriages cannot be free from the influence of a matrilineal social structure: the man of authority of the wife's *sing* may visit these couples now and then, curb the husband's power and remind both partners of the orientation towards the matri-kin, the *sing*, though this pressure is insignificant in comparison with that experienced by the heiress's family. Likewise, a husband now and then visits his youngest sister's house, *ka sing* son. These constant matrilineal contacts offer husbands chances of escaping from even the slightest matrimonial tension. Whenever a Khasi man feels uneasiness, he will return to his sister's house rather than face a difficult situation with his wife. This tendency is maximized especially on the occasion of religious ceremonies, when all individuals are grouped around each *sing*.

It is apparent that the rules of the *sing* as the underlying structural pattern, function throughout the various categories of domestic unit of the Khasi community as the most important intrinsic force.

VII. Polygyny

After this long attempt at the structural analysis of marriages, I think one can theoretically predict what is the situation of polygyny among the Khasi. The theoretical framework elaborated through preceding discussions can also be tested by the empirical data in terms of polygyny.

Nowadays, the Khasi feel so strongly against polygyny that they have no knowledge even that they ever practised it. Many Khasi, in more sophisticated areas, did not believe my findings on polygyny in Sohkynduh and Kongton. I think this is due to the rapid Christianization of the Hills during the last hundred years. My interpreter, though he was not Christian, said to me in the village, "it is most regrettable to bring you to a village where we find polygyny." However, one of the ministers of the Cherra State to which the two villages belong, told me that there was no particular opposition to polygyny, though recent Christian influence gave people the idea that it was a shameful custom, and he mentioned the case of a polygynist in his area, a man who had recently died, who had had ten wives. In Jatinga whose inhabitants are all Christian, and in Shella where there has been much contact with, and influence by, Hindus, there were

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

118 no polygynists, though there were many personal temporary illicit relations or love affairs.

• 184 595 It is true that even in interior villages polygyny is rapidly decreasing. In the two villages I found only two cases of polygyny: a man with two wives in Sohkynduh (Josio in List 6, whose wives are 26 and 32), and a man with three wives in Kongton (Jubongrai in List 9, whose wives are 8, 20 and 52). These cases appeared clearly as cases of polygyny which the villagers recognized as such, speaking of them quite differently from the way they would have spoken of lovers, calling them wives and husbands. Of course, the first wife socially outranks the secondary wives, as *ka tynga trai*, and the term *ka tynga tuk* is used for the latter, as Gurdon states (1914, p. 80). The difference being that the first wife has a legal marriage ceremony while the 585 others have not—*ka tynga tuk* means literally 'stolen wife.' About 595 the marriage ceremony, Gurdon gives a detailed discription (*ibid.*, pp. 127-130) and says there are three forms of marriage ceremonies, *Pynkiarsynjat*, *Lawdok* and *Iadik-biad*. The first and second forms are considered the more respectable; the last one is resorted to by the very poor who cannot afford the greater expense entailed by the first two. Unfortunately, during my stay in these villages, no marriage ceremony took place, but villagers described to me what seems to be the *Iadik-biad*, where only a fowl is sacrified, and the whole procedure is much simpler than that described by Gurdon. However, whatever the complexity and richness may be, there is a distinct line between having a ceremony and not having it, and this draws the distinction between the status of the first wife and that of the secondary wives.

428 Nevertheless, this distinction has more of a social bearing than the 595 legal bearing it has in a patrilineal system. Since they follow the 851 matrilineal system, the legal distinction between the first wife and the secondary wife does not affect their children's status and their property rights, at least not in the villages where I worked. The children's social locus is determined by their mother. The children (particularly the youngest daughter) have the right to inherit their father's acquired property which is automatically under their mother's ownership. If the polygynist father has acquired property by working their mother's field, or in trading on behalf of their mother, whether she be the first wife or the second, this property undoubtedly belongs to the children of that wife, not to the first wife alone. The father's physical locus at the time of his economic realisations is the decisive factor.

591 The Khasi polygynist, without bringing his wives into one house- 595 hold, alternates his residence among them, in turn or according to his temper. This practice is similar to that of the Trukese described by Goodenough (1951, p. 123), and quite different from that of the Garo

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

APPENDIX

SOME ADDITIONAL INFORMATION FROM SHELLA AND JATINGA

SHELLA

Shella is situated on the lowest of the southern slopes of the Khasi Hills, bordering on the Sylhet plain of East Pakistan. For centuries the people of Shella maintained close trading connections with the people of the plain, so that they have been much influenced by the Hinds. They have been to some extent divorced economically and culturally from their own people who live in the uplands and on higher part of the slopes. Actually, this is a natural result of their geographical location. From Cherrapunjee, the southern edge of the upland Khasi Hills, only a narrow footpath goes down to Shella. The altitude of Cherrapunjee is about 5,000 feet and of Shella from 500 to 1,000 feet, and the distance between them is 8 miles. The path descends very steeply and is full of hard stones. This difficulty of communication is also why the Hinds influence did not penetrate the upland Khasi, as in the case of the Jaintia Hills.[1]

This area has a unique political organisation which differs from the majority of Khasi states who are traditionally ruled by the members of the Siem clan. Shella is organized as a confederation, called 'Shella Confederacy,' and consists of four local villages. The head of the village is called *wadadkar*, and is elected by the villagers every three years. The number of households of the Shella Confederacy was about 900 in January 1956. The names of the four villages and their *wadadkar* in 1956 were:

Name of village	*Name of wadadkar*
1. Shella	Devish Mohan Roy
2. Mushtoh	Ditojou Roy
3. Nongtrai	Orju Roy
4. Tyngngar	Jabuni Roy

Each village is divided into sections. For instance, Shella village has nine sections: (1) Jasir, (2) Diseng, (3) Duba, (4) Jamao, (5) Nongrum, (6) Nongnong,

1. However, Shella was the only way out and the main gateway from the Khasi Hills to the plain; it was here that the British first entered the Khasi Hills. They proceeded from Shella to Cherrapunjee and made the latter headquarters of the Khasi Hills in 1833.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Shella

Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards 131
along the steep slope, looking down towards the Bengal plain. The climate
of this part of the hills is considered to be one of the worst in tropical India 132
for human habitation. The Bengal plain, though warmer than this area, is
considered more healthy. This border land is the zone of malaria, typhoid, 164
black fever, cholera, etc. None of the Bengalee peasants dare to live in such
an area. However, it is the most fertile for products such as betel-nuts, pan- 433
leaves, oranges, bananas and pineapples, and it also produces limestone. These
people seem to prefer to settle in this zone and to enjoy its prosperity, at the 164
expense of human lives: every year, especially between March and September,
the inhabitants suffer from various fevers and dysentry and other diseases, many
of the weaker facing death. 648

Before the Partition of India and Pakistan, the products of Shella were 177
carried down the Shella River to Sylhet, one of the biggest centres in East 178
Bengal, which brought unimaginable wealth to the Shella people. Their houses
were built by carpenters from Sylhet. The style and structure of these houses 434
were exceptionally elaborate for the Khasi. They purchased vast rice fields [439]
in the plain, which used to be cultivated by Bengalee and Garo labourers [342]
engaged by them. These Khasi do not themselves know how to cultivate [166]
rice fields; they have always been managers or landowners. Their boys used
to be sent to high schools and colleges in Sylhet. As a result of their trading [464]
with the Bengalee, many of them read and speak fluent Bengalee. There is [874]
no difference between their style of clothing and that of the Bengalee, though
the women maintain their traditional dress in the Shella style. [191] [291]

They have thus been distinguished from the rest of the Khasi not only
geographically, but also economically and culturally. Their personality also
differs sharply from the rest of the Khasi. They are very sociable, and quick, 157
a quality lacking among the Khasi of Sohkynduh and Kongton. They are
clever enough to deal with strangers. The upland Khasi say Shella people 184
are very cunning. This remark shows one side of these people. They had to 648
be cunning, since they traded with the Sylhet Bengalee who were said to be the
most cunning of their race. Their role in the trade and in the history of the 177
modernization of the Hills was considerable. For centuries they represented 178
intellectual Khasi owing to their contact with Hindu civilization, while the
Hills remained in darkness. They assumed an important role when the British [439]
established an administration in the Hills, and even up to now, many leading
Khasi originated from this area: for instance, Lati Hat, the first interpreter
of the British Headquarters at Cherrapunjee; Jeebon Roy, who was the first
Magistrate among the Khasi; Maham Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jeebon Roy); Nichols Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nichols Roy), Principal of the Gauhati University, etc.

Through constant cultural contact with Hindu, and encouraged by their 177
economic prosperity, the Shella Khasi, like the Jaintias, have been much 648
influenced by Hindu culture. However, this does not mean that the people
of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, 771
and some ceremonial elements were borrowed from the Hindu, most of the 795

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

621 descent grouping are often different. This is a very similar pattern to the
• [184] mobility which I discussed in Sohkynduh and Kongton (see p. 112).

One of the outstanding features in this community is the strong paternal
178 authority, established especially in the first generation, because the father's
593 (husband's) contribution was very important in such circumstances: their
61 domestic units were completely independent from the *iing* either of husband or wife. Some of them came with their wives, and many younger ones and their sons brought their wives from their homeland afterwards, thus practising virilocal marriage.

621 They have an interesting social usage which reflects the importance of the husband of the first generation. This is the addition of the name of the husband of the first generation to the matrilineal clan name in order to differentiate each particular descent group established at Jatinga within the same clan. For instance, Rupsi-Tah, Rupsi-Loh, Rupsi-Khla and Rupsi-Lati are found in the Rupsi clan. Rupsi-Tah is one of the lines of the first immigrants to Jatinga, which I have mentioned as Rupsi: Tah was taken from Pryntah, the husband of Sintu (Rupsi) (see p. 171). Thus the present inhabitants of Jatinga are very conscious of their father or grandfather, though they strictly follow the matrilineal descent rule. From such a usage of naming a clan, the Indian officer, who gave me some information about Jatinga before I went there, made the mistaken deduction that they had changed from matrilineal to patrilineal, assuming this to have come about as a result of the influence of patrilineal tribes around Jatinga. But this is simply due to the fact, firstly, that they hold in high regard the man of the first generation, because of his great contribution; secondly, that they distinguish themselves from members of the same clan according to the descent group established at each immigration; in other words, it indicates each *iing* grouping in the village.

178 The fundamental Khasi social organization based on the matrilineal system
184 did not change at all. I could observe in Jatinga exactly the same principle in action as I had found in Sohkynduh and Kongton. The village endogamy
582 has also been well established in the present generation: there are about 20 different clans which can intermarry, and taking a spouse from an outside com-
61 munity has become very rare nowadays. Marriage patterns in relation to the *iing* structure and all its related aspects are surprisingly similar to that of the
621 communities in the Khasi Hills. The solidarity of the *iing* is even greater in Jatinga, particularly among the rich, because of the greater accumulation of wealth and greater economic activity, which also increases the authority of the *iing* as manager of considerable property—this was also the case with the Shella people. Jatinga demonstrates that in spite of colonization and of a significant change in economic activities, Khasi social organization has maintained itself intact. This situation is in contrast with the considerable social changes observed among the Garo community in colonial areas like Rinsibara and Joshipara.

621 ***Intermarriage.***

178 From the earliest period of the establishment of Jatinga up to the present,
582 some changing aspects of marriage patterns relating to intermarriages are to
563 be observed.

As I stated before, in the earlier period, the people used to bring their spouses from their homeland, but they also married neighbouring tribal peoples, namely,
563 the Zemi-Naga, the Kuki and the Cacharee of villages close to Jatinga, and
621 also the Lushai, the Bengalee, the Moslem and the Anglo-Indian who lived in Haflong, the biggest political and commercial centre in the Hills, situated

group of matrilineal and Mon-Khmer-speaking people 101
who claim as their ancestral homeland the present- 131
day United Khasi-Jaintia Hills District (within ap- 197
proximately 90° 47' and 92° 52' E. and 25° 5' and
26° 5' N.). This group includes the Jaintias (also 101
Pnar or Synteng) in the southeast, who differ from 184
the Khasis primarily in their duolocal residence pat- 162
tern and less virulent forms of sorcery. (The Hadem
in eastern Jaintia are a Kuki people.) It also includes 563
the Lyngngams (also spelled Lyngam) in the west, [91]
who practice migratory swidden agriculture and cer- [54]
tain peculiar funerary rites, and are said by Ehren- [84]
fels (1955) to be culturally intermediate between [764]
Khasis and Garos. Finally, it includes Bhois, Wars, [115]
and upland Khasis, which terms are primarily terri-
torial. Bhoi country is the north-central part of the
District, and is culturally complicated by the presence
of Mikirs, Lahungs, and Nepalis. War country spans [428]
the entire southern length of the District, so that
Wars divide into Jaintia Wars and Khasi Wars; of
these, the Khasi Wars have traditionally transmitted
property to sons as well as to daughters. The upland
center of the District is the country of the Khasis
proper, those whose culture provides the most useful
model for interpreting the variations found elsewhere.
[For general reference on all categories of Khasi cul- [113]
ture, cf. Costa 1936 and 1937; also Gurdon 1907,
especially for data on regional variations.] **Geography.** 133
The District is 5,554 square miles of hilly tableland, [131]
intricately dissected by numerous rivers, and marked
by significant ecological variation over very short
distances. The tablelands step gently downward north
from Shillong Peak, which at 6,445 feet is the highest
point in the District, and over about 55 miles ease
into the Brahmaputra valley where this is some 250
feet above sea level. To the south, the land slopes
more steeply downward for about 20 miles, and then
drops abruptly, in cliff and steep-slope formations,
to the Ganges sea-level delta that begins at its
north with Sylhet. The annual southwest mon- 132
soons drop torrential rains around Cherrapunji and
Mawsynram villages (for Cherrapunji, a record 805
inches in 1861), but then, reaching Shillong 33 miles
to the northeast, provide only about 100 inches per
year. Rainfall is again greater in Bhoi, which shares
the Brahmaputra valley climate. Climate is temperate
on the high Shillong plateau, where it seldom freezes
and never snows. To the north, climate becomes sub-
tropical, forest is jungly, and fauna abound. The cli-
mate to the south is also subtropical. [Cf. Hooker [113]
1891: chap. XXIX.] **Linguistic affiliation.** Khasi is 197
one of the major Mon-Khmer languages, related to
Mon, Khmer, Semang-Sakai, Nicobarese, and Pa-
laung-Wa. The major Khasi dialects are Khasi, Jain-
tia, and Lyngngam, to which Grierson adds War.
Further minor variations occur from village to village.
The Khasis had no script until 1842, when the roman [212]
alphabet was successfully applied to the Cherrapunji
dialect of Khasi proper. [Cf. Rabel 1961; Grierson [113]
1903-28: 2; Bareh 1962.]

pendable water supply. Villages are about two to five miles apart, and have no boundary markers. In the past, villages contained semipublic buildings and grounds: the home of the village priest (also the home of a chief if he resided in that village), the village marketplace, and tree graves, cremation grounds, or other awesome spots that were believed to be inhabited by supernatural beings. Villages today may have also one or more Christian churches, government social welfare buildings, and schools. Formerly, villages were entered through a guarded gateway; this is no longer the case, and paths feed into villages from all directions. Often several villages are nucleated into one large unit, named and also described as a "village." These were once defense units, but were so uncohesive otherwise that institutionalized rivalry obtained among the component villages. Now, they have been integrated through the agency of all-village public services, especially schools. **Housing.** The traditional Khasi house is entered through a door at the rounded end of a U-shaped ground plan, and is about 20 feet at widest extent; it is about 30 feet deep, and is elliptical or hogback in profile. Its walls are of stone blocks cemented with mud. The roof of grass thatch, supported by a bamboo frame, overhangs the walls on their outside, down to about three feet above the ground. The house is divided into two parts: the front one-third is on the ground level, floored either with stone blocks or tamped earth, and is used for storage of occupational instruments and as a shelter for poultry. The rear two-thirds is raised four feet on piles of stone blocks to a platform of planks, and is partitioned into six rooms, comprising a kitchen, areas for storage of food and water, and sleeping quarters. Furniture is minimal, and the house is totally undecorated. There are no windows, and no smoke vents. A house generally has a companion shed, walled of wood and grass matting and thatched with grass. This serves as a pigsty, but it may be partitioned also to house cows, and it may have a loft for fuel storage. Compounds often contain garden plots, and are fenced around with stone or bamboo and mud. Nowadays, the traditional house has given way to Western-style bungalows of wood and tin, especially in and around Shillong. [Cf. Mukherjee et al. 1941.]

ECONOMY. The Khasi economy is a market economy based on agriculture, and most Khasis are primary producers, sellers, middlemen, and/or providers of services in connection with markets. Khasis are often multioccupational: they produce goods for partial subsistence, and also play some part in trade. **Agriculture.** On the Shillong plateau, the major field crops are potatoes, maize, millets, and dry rice, still produced mostly through swidden farming, with a two- to three-year period of fallow, but increasingly through continuous use of a single field with the aid of ma-

16: McCormack E-4,5 (1956-1958) 1964
[P. 108A] AR7 Khasi AR7

mure and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Bhoi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Bhoi country are paddy rice, lac, caoutchouc, cotton, bananas, and pineapples; in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stegmiller 1925.] **Gathering.** Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsboy during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for hunting dogs. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chilies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stegmiller 1924a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

MARRIAGE AND FAMILY. **Mode.** According to the traditional courtship pattern, a group of young male relatives and friends made nightly visits to the house of some virgin girl in another village, appraising her through banter while she and her parents appraised them, and staying the night to avoid the dark walk home. Marriage was according to the wishes of the parents after negotiation by a go-between from the boy's side. Girls might be 15, and boys 17, years of age. Girls have now acquired freedom of movement through attending school, however. Premarital sexual play is common, and young people choose their own spouses when the girl is about 19 and the boy 21. The most common mode of marriage is elopement, for Christians and non-Christians alike, but some Christians marry in church, and some Khasis still marry according to the traditional ceremony or some variation on it. There are no preferred or prescribed marriage types, nor is there a bride price or dowry. **Form.** Monogamy is the ideal for all. **Extension of incest taboos.** Sibs are exogamous. Other prohibited marriage partners are real and classificatory FaSi and FaBr, FaBrCh, FaMo, and FaMoMo. The MoBrWi is also prohibited. Roy 584 582 562 178 836 584 583 585 184 583 581 835 [114]

household deities, and measles and smallpox deities. 776
Deities of the first two categories are simply aspects 771
of the high God or Goddess. • The earth is peopled with two great orders of land demons and water demons who cause all undesirable, unnatural, and otherwise inexplicable events, acting either on their own or as instruments in the hands of sorcerers. Apart from omens, both in nature and in dreams, 787
Khasis attach supernatural significance also to mystic 822
numbers, and to the colors white, black, and red. They hold especially important folk beliefs regarding 824
betel nut, paddy rice, gold and silver, and clothing. **Practitioners.** The two classes of religious practitioners 791
are the village or state priests and the sacrificers. 793
Both are male. They use the same divinatory techniques of reading broken eggshells and the entrails 754
of cocks, and they both sacrifice cocks, hens, goats, pigs, and cattle. Their skills are not taught to them so much as picked up by observation and confirmed by demonstrations of efficacy. A priest is elected from among the men of his sib to direct his skills to the public good until he dies, and his rewards are institutionalized and come from the village or the state. A sacrificer acts for private persons or kin groups, on call, and is rewarded by them personally with gifts in cash or in kind. The sacrificer is called upon to explain and then to ritually remedy every variety of misfortune, especially illness, though his powers are nowadays regarded with ambivalence, and he is widely expected to become a sorcerer sooner or later. • There are two major types of sor- 754
cerer. One is the ritual specialist or sacrificer who secretly turns his skills from good to evil, manipulating demons to injure a person or kin group, and acting always for himself alone out of considerations of jealousy or revenge. The other is normally a leading citizen, a woman who is so wealthy and successful that it is believed that she must keep a *thlen*, i.e. a creature which will bring her prosperity as long as she feeds it periodically with human blood. To provide this blood, the men of her household, or other males whom she bewitches with a special whisky, will indiscriminately murder anyone except a mem-
ber of her matrilineage. The Jaintias have an ana- [184]
logue to the *thlen* in their *taro*, except that the ultimate result is death from illness rather than murder. Minor witchcraft can be perpetrated by poison keepers or persons with an evil eye, who are often women. **Ceremonies.** The important traditional 843
ceremonies were the life-crisis rituals relating to 844
pregnancy and childbirth, the naming of a child, and 553
death. Lesser ceremonies related to marriage and 764
divorce, and to housebuilding. All these rituals were 585
addressed primarily to the ancestors, and they are 586
still performed in modified form by many Khasis. 342
Other rituals, which were performed by groups such 769
as villages, sibs, local descent groups, or households, 178
were addressed to the unnamed aspects of the high 782

Blacksmithy and making of baskets, cane products, etc, out of cane and bamboo, are a traditional occupation Weaving and spinning of cotton, rearing of endi cocoon and weaving of endi, etc., are in vague only in the Bhoi area and the areas adjoining Kamrup and North Cachar and Mikir Hills districts. Lac rearing is found in the northern portion of the district, *i.e.*, Nongpoh area. 184

Except cane and bamboo works and blacksmithy other industries are practised in a very limited scale. There is thus a lot of scope for introducing cottage industries in the district.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

428 to the sisters of his wife, or to her nearest relatives if there are no sisters. The rank and titles of a deceased male descend to his brother; when no brother exists, then to the male children of his mother's sisters (maternal aunts); should the maternal aunts have no male children living at the time, then to the eldest male child of his sisters. When no relatives are to be found, the property of the deceased goes to the ruler of the country; or if a man dies leaving no relative other than wife and children, *i.e.* no relatives on the mother's side, the property in this case also goes to the ruler, who, as the wife and children cannot preserve the ashes of the deceased, takes charge of them, and for so doing takes all the property also. With regard to the inhabitants of the Lower Hills at Shellá, the custom as to succession is as follows:—Property belonging to a subject of Shellá is divided into two classes—(1) Property inherited from ancestors, which descends to the nearest of kin or to the relative of a deceased person who can perform his obsequies. (2) Property acquired during the lifetime of the holder, which is inherited by the children, whose duty it is to provide for the maintenance of their mother until she re-marries or dies.'

434 465 MATERIAL CONDITION OF THE PEOPLE.—The Khásiás and the Syntengs are as a people prosperous. Common labourers, if adult males, can earn wages as high as one shilling per diem, and adult 342 females as high as eightpence. The dwellings of the well-to-do classes are generally constructed of masonry, with thatched roof and 352 plank floor, and divided into two or three rooms. The furniture consists of a bedstead (*charpái*), a seat or two (*morá*), some cooking utensils, and a few boxes. The ordinary peasants and poorer 342 classes construct their huts of stone, mud, or plank walls, with a 184 thatch or cane roof. These are fitted with wooden platforms or loose planks placed on the ground to serve as beds. The food 262 of the well-to-do classes consists of rice, fish when obtainable, fowl 434 or meat, curry, vegetables, oil, hog's lard, fermented and spirituous liquor. It may be estimated that the living expenses of an average-sized household of this class would be about Rs. 25 or £2, 10s. a month, valuing the articles of consumption at *bázár* prices. An ordinary husbandman or labourer lives on rice, dry fish, occasionally a 276 little meat, oil, or hog's lard. *Pán* leaf, betel-nut, and lime are essential to the comfort of all the hill people, who are inveterate chewers of *pán*. They commence at an early age, and are rarely seen without a *pán* leaf in their mouths; the females are quite

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

249 173 [115] my informants at Padu), in the year 1933, is said to have begun the cultivation of yam (*shniw*) and millets (*knei*) in the then uncultivated slopes. He and his people used to be, on this account, ridiculed as monkeys (*shrieh*). The Nonglamin clan took later to pan-leaf-, and arecanut-cultivation and became one of the richest landowners of the Wár-country. Others followed and imitated them. This clan (*kur*) is now residing at Nongtalang, about ten miles east of Padu in the Wár-Jaintia slopes.

174 This possibility of a comparatively recent origin of the now economically 184 independent Wár-groups among the Khasi speaking peoples is of importance 601 to the question of some different terms in kinship terminology which the following lists will show.

184 Comments on other features in the relationship terminology, bearing 601 on sociological or historical problems of either among the four Khasi speaking groups under discussion, are being hinted at in the text of the lists itself and further discussed in Part Three of the present paper, following the lists of kinship terms.

II. The List of the Kinship Terms

(*u* is the definite article masc. gen.; *ka* — the definite article fem. gen. Both are prefixed to proper nouns and then assume the meaning and function of the English Mr. and Mrs. [or Miss] respectively.)

No.	English	Plateau Khasi	Wár Khasi	Pnár (Jaintia)	Wár Jaintia
1.	To give birth or beget:	*kha* (noun: *jyng kha*)	*kha*	*kha*	*dihun*
1/*a*.	To give birth to a girl:	*kha kynthei*	*kha kynthei*	*kha kynthai*	*dihun kynthah* (*kinthai*)
1/*b*.	To give birth to a boy:	*kha shynrang*	*kha shynrang*	*kha shynrang*	*dhun tyrma* (*tyrmai*)
1/*c*.	To give birth twins:	*kha synrap*	*kha bynrap*	*kha synrap* (or: *arngof*)	*dihun brap*
2.	Child:	*khynnah* (with *u* and *ka* respectively)	*khun* (or: *khunlung*) (*u* and *ka*)	*khyn bo* (with *u* and *ka*)	*kimbot* (with *u* and *ka*)
2 *a*.	Childhood:	*ka jinglong khunlung*	*ka jinglong khunlung*	*ka porkhynnah*	*ka hymbotlung*
3.	Puberty of a girl or boy:	*sdang samla* (or: *khynraw*)	*jan samla*	*sdang khyllud*	*khynrong darow*
3/*a*.	Marriageable girl:	*ka samla* (or: *khynraw*)	*ka samla* (or: *khynraw*)	*ka khyllud*	*ka darow*
3/*b*.	Marriageable man:	*u samla* (or: *khynraw*)	*u sahla* (or: *khynraw*)	*u khynro*	*u darow*
4.	Woman:	*ka* (or: *ka kynthei*)	*ka* (or: *ka kynthei*)	*ka kynthai*	*ka* (or: *ka kyntha rangbah*)
5.	Man:	*u* (or: *u shynrang*)	*u* (or: *u shynrang*)	*u* (or: *u chynrang*)	*u* (or: *u tyrmu rangbah*)
6.	Article of respect: *i* (instead *u* or *ka*)	for both sexes is a term of diminution: used as honorific prefix; but has a contemptuous meaning in the Jaintia dialects			
	Parents:				
7.	Mother:	*i mei* (-addressing); *kmie* (-referring)	*i mei*; — *kmie*	*ka bei*	*ka ma*
8.	Father:	*i pa* (-addressing); *kpa* (-referring)	*i pa*; — *kpa*	*u pa*: *pain*	*u pa*
9.	Siblings and maternal cousins:	*para* (-referring only)	*para*	*pain*	*para*
9/*a*.	"Brethren"; as in the phrases:	*para lum* — "Brethren Hill (tribesmen)" *para kristan* — "Christian Brethren"	— (?)	— (?)	— (?)

Garo Hills	117	162
Manipur	69	101
Total	4,091*	

The following information regarding the general aspect of [127] the Khasi and Jaintia Hills district, with some additions, is 133 derived from Sir William Hunter's Statistical Account of Assam. The district consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is very steep until a table-land is met with at an elevation of about 4,000 feet at Cherrapunji. Higher up there is another plateau at Mawphlang. This is the [361] highest portion of the hills, some villages being found at as high an elevation as close on 6,000 feet above sea level. Fifteen miles to the east of Mawphlang, and in the same range, is situated the civil station of Shillong, at an average elevation of about 4,900 feet. The elevation of the Shillong Peak, the highest hill in the district, is 6,450 feet above sea level. On the northern side of the hills are two plateaux, one between 1,000 and 2,000 feet below the level of Shillong, and another at an elevation of about 2,000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where 137 the hills have been denuded of forest, the country is covered 185 with short grass, which becomes longer and more rank in the 374 lower elevations. This denudation of forest has been largely 327 due to the wood being used by the Khasis for fuel for iron smelting in days gone by. The Government, however, has taken steps to protect the remaining forests from further 137 spoliation. A remarkable feature is the presence of numerous sacred groves situated generally just below the brows of the [778] hills. In these woods are to be found principally oak and rhododendron trees. The fir-tree (Pinus Khasia) is first met with on the road from Gauhati to Shillong, at Umsning, at an elevation of about 2,500 feet. In the neighbourhood of Shillong the fir grows profusely, but the finest fir-trees are to be seen

* The figures for Khasi population in the Khasi and Jaintia Hills district will be found under "Habitat."

14:Roy I-5 (no date) 1938 AR7 Khasi AR7

602 join to the *a* woman in life through only one of the primary stages in the life essence when it was sustained through the umbilical cord.

Thus the connection of the *a* group is sustained to a much longer period and greater intensity in its life-formation to the *a* woman, than the *b* son.

Hence we have the double means of sustenace of life producing, through the umbilical cord and the breast, the single group *a*, while the single connection of life-formation through the umbilical cord produces a double a+b man-woman connection with the *b* son.

Thus he stands alone in the centre and he places his *jain na ka kpoh* (the kind which springs from the same womb), that is, those of (a) group (see tables) on one side, and he places his *kha* or those connected, or sprung of, the one umbilical cord, that is, those of (b) group on the other side. On the other side is *ka rymieng ka rngiew*, the 'stature', the person from which he also derives his. Then the Khasi calls the source (*thymmei*) from which he springs, *ko kur ka rngiew* (stature, person) *ki kha na uwei u sohpet* (those connected or sprung of one umbilical cord).

602 609 156 Thus the Khasi has his house of *ki kur ki jaid* the relatives of his kind and species, and his world of *ki kha ki man*, relatives of other people's kind and species with whom they are able to propagate human life.

This interesting Khasi fabric of human relationship between man and his mother and father, [186] of the connection between a man and his fellow-

14. Roy 1-5 (no date) 1938 AR7 Khasi AR7

human beings all over the four quarters of the globe (*ehi snieh ka pyrthei*) with whom, in the world, he can give in marriage and take in marriage, shows the nature which is believed to be innate in the Khasi, and his supposed power of moulding the world. His nature is to grow and to resist, to extend and spread out. It is against his idea of life to remain narrow or limited and resourceless. He is not to be made small or made an orphan, it will not do for him and his idea of the world to '*sah khlem khun kelem kti*,' stay without kind and species, without child, without issue. A couple would even seek to separate if there are no children of the union. His idea is, so to say, 'imperialistic,' to sow and spread out. As I wrote elsewhere, "A Khasi marries men and women of all races; to his Khasi parent the issues are all one and the same without any distinction of caste or creed or colour or possessions. The children are the 'khun kha' (*khun* = child, *kha* = born, i.e. children who are born through the union of a descendant of the parent with a descendant of another parent), and these children are unified into families and are assimilated, in the Khasi idea of life, while these groups of families are traced to their mother and are made to revolve on this ancestress as the pivot of their existence."

Thus the Khasi shows :—

One one side – mother
|
Son—mother
which is, – mother
|
the son of one's own – his kinswoman

On the other side also he shows – mother
|
Son – mother
which is – Father's mother
|
the son of others his kinswoman

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

Shella

Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards along the steep slope, looking down towards the Bengal plain. The climate of this part of the hills is considered to be one of the worst in tropical India for human habitation. The Bengal plain, though warmer than this area, is considered more healthy. This border land is the zone of malaria, typhoid, black fever, cholera, etc. None of the Bengalee peasants dare to live in such an area. However, it is the most fertile for products such as betel-nuts, pan-leaves, oranges, bananas and pineapples, and it also produces limestone. These people seem to prefer to settle in this zone and to enjoy its prosperity, at the expense of human lives: every year, especially between March and September, the inhabitants suffer from various fevers and dysentry and other diseaes, many of the weaker facing death. 131 132 164 433 164 648

Before the Partition of India and Pakistan, the products of Shella were carried down the Shella River to Sylhet, one of the biggest centres in East Bengal, which brought unimaginable wealth to the Shella people. Their houses were built by carpenters from Sylhet. The style and structure of these houses were exceptionally elaborate for the Khasi. They purchased vast rice fields in the plain, which used to be cultivated by Bengalee and Garo labourers engaged by them. These Khasi do not themselves know how to cultivate rice fields; they have always been managers or landowners. Their boys used to be sent to high schools and colleges in Sylhet. As a result of their trading with the Bengalee, many of them read and speak fluent Bengalee. There is no difference between their style of clothing and that of the Bengalee, though the women maintain their traditional dress in the Shella style. 177 178 434 [439] [342] [166] [464] [871] [191] [291]

They have thus been distinguished from the rest of the Khasi not only geographically, but also economically and culturally. Their personality also differs sharply from the rest of the Khasi. They are very sociable, and quick, a quality lacking among the Khasi of Sohkynduh and Kongton. They are clever enough to deal with strangers. The upland Khasi say Shella people are very cunning. This remark shows one side of these people. They had to be cunning, since they traded with the Sylhet Bengalee who were said to be the most cunning of their race. Their role in the trade and in the history of the modernization of the Hills was considerable. For centuries they represented intellectual Khasi owing to their contact with Hindu civilization, while the Hills remained in darkness. They assumed an important role when the British established an administration in the Hills, and even up to now, many leading Khasi originated from this area: for instance, Lati Hat, the first interpreter of the British Headquarters at Cherrapunjee; Jeebon Roy, who was the first Magistrate among the Khasi; Maham Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jeebon Roy); Nichols Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nichols Roy), Principal of the Gauhati University, etc. 157 184 648 177 178 [439]

Through constant cultural contact with Hindu, and encouraged by their economic prosperity, the Shella Khasi, like the Jaintias, have been much influenced by Hindu culture. However, this does not mean that the people of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, and some ceremonial elements were borrowed from the Hindu, most of the 177 648 771 795

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

spade or some dried fish, etc. Products such as large quantities of fruits should be sold to the Jatinga people who buy them at reasonable prices. 182

The Khasi are born traders. This must be closely related with their economic technique, such as pan cultivation which makes it impossible for them to live without trading. Hence, though they are hill people, they have had close economic contact with the peoples of the surrounding plains. At the same time, some of them have had a very similar economy to that of other tribes, such as that of Sohkynduh and of Kongton; hence they are familiar with tribal economy. On the whole, their dealings with the tribes as well as with the plains peoples are fair, though they are hard bargainers. Indeed the Khasi are quite welcomed by both sides. Thus the Khasi play an important role as intermediary between the tribes living in the hills and the Hindu (and Moslems) living in the plains.[1] 44 648

The economic contact is the most important of the many contacts between Jatinga and other tribal villages. Social contact, as appeared in intermarriages, is a rather marginal matter for the total population. Cultural contact is negligible: I only observed one indication—some fashionable tribal girls sometimes wear Khasi women's dress when they go to the Haflong bazaar. In their contact with tribes, the Jatinga Khasi speak Hindi which is the common language at Haflong bazaar for all tribes and peoples in this area. A few men of Jatinga speak some tribal language, but none of the tribal speak the Khasi language. 648 182 [191]

In spite of such great differences in culture, economy and social organization, the relationship between the Jatinga people and the tribes has remained very friendly. For instance, as I mentioned before (p. 175, note 3), the tribes lent their land to Jatinga people who were suffering from a great economic depression. Their actual behaviour also reflects such a friendly relationship. It is said that at the time of the Golden Jubilee of Jatinga in November 1955, many Zemi-Naga, Kuki, and Cacharee came and performed their dances for the celebration.

1. The important role of the Khasi as intermediary is not only in the economic field, but also in the political and cultural fields: nowadays many Khasi officers are sent to tribal areas by the Government. They are very efficient in dealing with such work, because they are used to deal with both tribal and plain peoples.

[P. 178 is blank]

SECTION VII.

LANGUAGE.

197 BEFORE commencing to describe the more salient features of the Khasi language, its grammar, and syntax, it seems to be of importance to show how intimately connected Khasi is with some of the languages of Further India. In the middle of the last century Logan pointed out affinity between Khasi and these languages, but it has been left to Professor Kuhn to prove this connection to demonstration. The examples of comparative vocabularies which follow are taken from Kuhn's "*Beiträge zur Sprachenkunde Hinterindiens*," Sir George Scott's "Upper Burma Gazetteer," and Sir George Campbell's lists. It will be seen from the collections of words that follow how Khasi possesses many words in common with Mon or Talaing, Khmêr, Suk, Stieng, Bahnar, Annam, Khamen-Boram, Xong, Samre, Khmu, Lemet, Palaung, and Wa. There is some correspondence, although perhaps to a lesser degree, between Khasi and the Ho-Munda languages and those of Malacca and the Nancowry language of the Nicobar Islands.

192 197 Let us now examine the table of numerals. The Khasi word for 1 is *wei*, but in the Amwi dialect of Khasi it is *mi*. In Khmu the word is *mui*, also in Suk; in Mon *mwoi* and in Xong *mui*. The word for 2 is identical in Khasi and Lemet, viz. *ar*. The word for 3, viz. *lai*, is identical in Khasi and Wa; also compare Lemet *lohe*. Khasi *saw* and Lakadong *thaw* for 4 are, however, deviating forms. In the case of 5, if we cut out the prefix *m* in the Mon word *m'sau*, we have fairly close agreement with the Khasi *sau*. In the numeral 6, if we cut out the prefix *hiu* of the Khasi (*hiu*)*riw*, and the initial *t* of Mon and Suk *t'rou*, *trou*, we have close agreement. In the Khasi words for 7 and 8 the syllable *hiu* is but a prefix. This is also probably the case in the Khasi word (*khyu*)*dai* for 9, and the *shi* in the Khasi word *shiphew*, 10, merely means one.

It will be seen that there is considerable similarity in the numerals of the different languages up to six, the correspondence being most strongly marked in the numerals 1, 2, 5, and 6. If we remember that primitive people seldom can count higher than the number of digits of one hand, the dissimilarity in the numerals, as the end of the decade is approached, is probably explained. As the different people speaking these languages gradually advanced in civilization they learned to count further; but by this time they had become in some cases like those of the Khasis, the Palaungs, and Mons, widely separated from one another. As they advanced in civilization, and found the necessity of an improved notation, they manufactured numerals which differed from one another, although they retained the first few numerals they had made use of in their days of savagery. Let us now study some extracts from Kuhn's interesting comparative vocabulary.* We find many instances of agreement. I give some examples:—

Heaven.—Palaung, *pleng*; Khmêr, *plieng* (rain); Xong, *pleng*; Khasi, *bneng*. Mynnar (Jirang) *phanliang* seems to be very near Khmêr *phlieng*, and Palaung, and Xong *pleng*.

Day (Sun).—Khmêr, *thngay*; Mon, *tngoi*; Annam, *ngay*; Lemet, *ngay pri*; Palaung, *sengei*; Khasi, *sngi*; Lakadong, *sngoi*; Kol, *singi*.

Year.—Mon, *snām*; Annam, *nam*; Stieng, *so'nam*; Bahnar, *sanam*; Khasi, *snem*.

Lightning.—Mon, *l'lí*; Khasi, *leilih*.

Stone, Rock.—Mon, *tmā*, *k'maw*; Stieng, *to'mâu*; Bahn, *tmo*, *temo*; Khmêr, *thma*; Xong, *tmo*; Palaung, *mau*; Ba, *maou*; Khasi, *maw*; Wa, *hsi-mo*, *hsi-mao*. Also compare Mynnar (Jirang) *smaw*.

Water.—Palaung, *em*; Khasi, *um*; Lakadong, *am*; Amwi, *am*; Mynnar (Jirang), *ām*; Rumai, *om*. Probably the Stieng *um*, to bathe, can be connected with the Khasi word for water.

Sea, pond, or *tank.*—Khmêr, *ping*; Khasi, *pung*.

Rice.—Mon, *sro*, paddy, seems to be in connection with Khmêr, *srur* (spoken *srau* or *srou*).* Xong *ruko* is in Palaung *rekao*, *sakao*, or *takao*. These words remind us of the Khasi

* Kuhn's "Beiträge zur Sprachenkunde Hinterindiens."

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

197 192 *khaw*, which seems to be borrowed from the Shan *khaw* (*hkao hsau*).

Dog.—The common word for this animal will be found to be nearly the same in sound in many of these languages, e.g. Suk, *cho*; Stieng, *sou*; Bahnar, *ko, cho*; Annam, *cho*; Xong, *tcho*; Mi, *khmu*; Lemet, *so*; Palaung, *tsao, hsao*; Khasi, *ksew*. The Mon *khluiw* is the same as the Khasi *ksew*, if l is changed into s. The Lakadong and Synteng dialects of Khasi have *ksaw*, and Mynnar (Jirang) *ksow*.

Rat, mouse.—Mon, *kni, gni*; Stieng, *ko'nei*; Bahnar, *kone*; Khasi, *khnai*.

Swine.—Bahnar *niung* is evidently Khasi *'niang*, the abbreviated form of *sniang*.

Tiger.—Mon, *kla*; Stieng, *klāh*; Bahnar, *kla*; Khmêr, *khlā*; and Khasi, *khlā* are evidently the same. With this compare the Kol *kula, kulā, kūlā*.

Bird.—Sue, *kiem*; Mon, *g'cem, ka-tsim*; Hüei, *chiem*; Stieng, *chum*; Bahnar, Annam, *chim*; Xong, *chiem*; Palaung and Wa, *hsim*, and Khasi *sim* are clearly the same. Also compare Mynnar (Jirang), *ksem* which is very near to Mon, *g'cem*.

Fowl.—Hüei, *kat, yar*; Suk, *yer*; Bahnar, *ir*; Stieng, *iêr*; Khmu, *yer*; Lemet, *er*; Palaung, *her*, and Khasi, *siar*, abbreviated into *'iar*, are probably the same.

Fish.—The word *ka* or *kha* runs through the following languages:—Mon, Stieng, Bahnar, Annam, Khmu, Lemet, Palaung, Wa: and if we cut off the first syllable of the Khasi word for fish, *dohkha*, we find *'kha*, which is the same word as in the languages above mentioned, with an aspirate added. The Khasi *doh* merely means flesh, and the word *dohkha* is very frequently abbreviated, cf. *'kha saw, 'kha iong*.

Crab.—Mon, *kh'tām*; Khmêr, *ktām*; Khasi, *thām*. If we add the gender sign to the Khasi word, it becomes *ka thām*, and we have exact correspondence.

Woman.—Mon, *brou* or *brao*. Is this the same as the Khasi (ka) *briw*?

Child.—So, *kŏn*; Suk, *kon*; Mon, *kon*; Hüei, *kuon*; Annam, *kon*; Khmêr, *kun*; Khasi, *khun*. Compare Nancowry, *kon*.

Eye.—The word *māt, mat, māt*, runs through several of these languages, e.g. Mon, *mat*; Huei, *mat*; Stieng, *mat*; Bahnar,

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

mat; Annam, *mat;* Khasi, *khmāt* (dialectic *māt*). In Nancowry compare *olmat*, eye, and *okmat*, eyebrow, and (*e*) *mat* (*hen*) *mat* (*drug*), *mat*, of the Nicobar dialects, also Semang *mat*, *met*, *med*. Kuhn remarks that the word *mat* is common for "*sight*," and "eye" all over the Malay Archipelago. It should be remarked that in the Amwi and Lakadong dialects of Khasi the word is *māt*. 192 197

Nose.—If we cut off the aspirate *kh* from the Khasi *khmut*, which thus becomes *mut*, we find some correspondence between Mon, *muh* (*mu*); Stieng (*tro*), *mŭh;* Bahnar, *muh*. Here also compare Ho *mua*, *muta;* Mundari, *mun;* Uraon, *moy*. In the Anwi and Lakadong dialects of Khasi the word is *mur-kong*.

Hand.—Xong, *ti;* Mon, *toi;* Annam, *tay*, Khmer, *te* (from *sang te*, finger); Palaung, *tae*, *tai*, and Khasi, *kti* (with prefix *k*) closely correspond. The forms *ta* and *toi* of Amwi, and Lakadong, respectively, still more closely correspond with the Mon-Khmer languages than with Khasi. Here compare Nancowry *tei* and *ti*, or *ti* of the Kol languages.

Blood.—Palaung *huam*, and Wa *nam* closely correspond with Khasi *snám*; here compare Khmêr *jhām*.

Horn.—Mon, *grang*, the horn of an animal, may be compared with the Khasi *reng*.

Far.—Distant. Bahnar, *hangai;* Annam, *ngai;* Khmêr, *chhngay;* Lemet, *sngay;* Sue *chngai* may be compared with the Khasi *jing-ngai*. Amwi *shujngoi* seems to be a closer form to the above than Khasi *jing-ngai*. But compare Mynnar (Jirang), *chngi*, which is clearly very close to Sue *chngai*, and Khmer *chhngay*.

To weep, to cry.—Mon, *yām;* Khmer, *yam;* Khmu Lemet and Palaung, *yam*, are clearly the same as Khasi *iām*, with which also may be compared Ho *yām*.

It is interesting to note that the Amwi and Lakadong dialects of Khasi, which are spoken by the people who dwell on the southern slopes of the Jaintia Hills, seem more closely to correspond with the Mon-Khmer forms than even with Khasi. The Mynnar or Jirang dialect of Khasi, spoken on the extreme north of the hills, also appears to possess some words which are very similar indeed to some of the Mon-Khmêr forms given by 197

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

indeed, belong to the untranslatables of the language. We are never in want of a specific term to express the appropriate degree of any quality." To learn how to use the right adverb at the right time is one of the niceties of the language. There is a peculiarity about some of the adverbs of place which should be mentioned: e.g. *Hangto*, there (within sight); *hangne*, here; *hangta*, there (out of sight); *hangtai*, there (at some distance); *hangtei*, there (upwards); *hangthi*, there (downwards); also the interrogative adverbs *hangno*, *nangno*, whence, contain the inherent root *nga*, and it seems possible that this *nga* is the first personal pronoun I. If this is so, *hangto* would mean literally "to me there," *hangthi* "to me down there," and similarly *nangno*, *nangne* would mean "from where to me there" and "from there to me here." 193

Adverbs generally follow the words they modify, as *u'n leit mynta*=he will go now, but there are exceptions to the above rule, such as interrogative adverbs. The following come before those they modify: *tang shu*, *la dang* (as soon as, when); *kham*, *shait* (used to, ever); *pat* or *put* (yet); and *shym* (not); but *shuh* (more) goes last. Adverbs of past time are formed by prefixing *myn*, e.g. *mynhynne*, a short time ago. Adverbs of future time are formed by prefixing *la*. The particles *man*, *man la*, and *hala* denote repetition.

The Khasis are exceedingly fond of using double words* which add much to the finish and polish of a sentence. Old people especially have a predilection this way. It is one of the great difficulties of the language to learn how to use such double words correctly. The following are some examples:— [195] 193 192

NOUNS.

kajain ka nep	cloth.
ka kot ka sla	paper.
ka lynti ka syngking	road.
ka ling ka sem	house.
u babu, u phabu	babu.
u tymen u san	elder.
ka stih, ka wait	arms (lit.: shield and sword).
u badon ba em	a well to do person.
ka spah ka phew	wealth.
u kha-u-man	a relation on the father's side.

VERBS.

pynsuk-pynsain	to comfort.

nior-nior, niur-niur	shakily.
ior-ior, iar-iar	weakly.
parum-pareh	many.
sip-sip, sap-sap	having no taste.

The Mikirs appear to have borrowed a small portion of their vocabulary from the Khasis. The following are quoted as examples of possible common roots:—

	Mikir.	Khasi.
belly	*pŏk*	*kpoh.*
strike (v.)	*chŏk*	*shoh.*
father	*po*	*kpa.*
come (v.)	*cŏng*	*wain.*
rice beer	*hor*	*hiar.*
maternal uncle	*nĭ-lur*	*kni.*

197 The Lyngam dialect differs so much from the standard Khasi that some remarks regarding the former will not be out of place. Dr. Grierson, on pages 17 to 19 of his Volume II. of the "Linguistic Survey of India," has indicated some of these differences, which may be recapitulated here as follows. Some of the commonest verbs vary considerably from those used in
197 the standard dialect. There are also many minor differences of pronunciation. A man is *u breo*, not *u briew*, a son is a *u khon*,
193 not *u khun*. Standard *ng* is often represented by *nj*. Thus
194 *doinj* for *ding*, fire. A final *h* often appears as *k*, and an initial *h* as *p*. Thus, *baroh* (Standard), all, becomes in Lyngam *prok*.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

193 Standard, the Present Tense is formed by using the bare root.

The Past Tense is formed in one of five ways, viz.:—

1. By suffixing *let*, as in *ong-let*, said.
2. By suffixing lah-let, as in *dih-lah-let*, went.
3. By prefixing *lah*, and suffixing *let*, as in *lah-ong-let*, said.
4. By prefixing lah, as in *lah-kyllei*, asked.
5. By prefixing *yu* (*yng*, *ym*), as in *yu-nai*, gave; *yng-kheit*, shook; *yu-pait*, broke; *yu-jai*, fell.

The Future is formed in a very peculiar way. The Standard *yu* is inserted into the middle of the root, immediately after the first consonant. Thus *rip*, strike; *ryuip*, will strike. If the root is a compound, it is inserted between the two members, as in *pau-yu-sop*, will fill. Here observe that the Standard causative prefix *pyn* becomes *pan* in Lynngam. The Infinitive has the same form as the Future.

Dr. Grierson points out the following most noteworthy fact with reference to the formation of the Lynngam Future and Infinitive, i.e. that similar infixes occur in Malay, in the Nancowry dialect of Nicobar, and the Malacca aboriginal languages.

The prefix of the Imperative is *nei*, as in *nei-ai*, give; *nei-lam*, bring. The usual negative particle is *ji*, which is suffixed, e.g. *nan-ji* is not.

NUMERALS.

802

[p.208]

SOCIAL GROUPINGS AMONG THE KHASIS OF ASSAM

by BHABANANDA MUKHERJEE

Dept. of Anthropology, Govt. of India

Calcutta

(Received on 20th October, 1957)

Introduction

131 611 421 [591] 192

THE Khasis, who inhabit the United Khasi and Jaintia Hills district of Assam, are matrilineal. Like the Garos, they, are matrilocal in residence. Exclusive ownership over family property is claimed by the Khasi women and the youngest daughter (*Ka-Khadduh*) who lives permanently in the house of her mother, is the custodian of the family property and the holder of religion (*Ka bat ka-niam*)[1].

121

This paper deals with the social groupings, namely, the clan, sub-clan and family, of the Khasis. The materials were collected in 1954 from Mawphlang, Cherapunji and Mamluh and Mawsmai villages farther south of the Chera State.

Discussion

192 614 [562] [611]

In the language of the Khasi, the prefix *Ka* is usually used before the name of a woman or any object belonging to a woman (or considered feminine). The use of *Ka* as a prefix before the name of each social group is suggested to have bearing on Khasi matriliny. *Kur* is not a very expressive and exact term for a clan. *Kakur*, which is supposed to have sprung from the woman (*long jaid na ka kynthei*)[2] is more exact. Similarly, *Ka-K'poh* and *Ka-iing* denote the sub-clan and family respectively.

---

[1] Gurdon, P. R. T., *The Khasis*, London, 1914 p. 89.

[2] Op. cit., page 82.

13:Mukherjee E-5 (1954)1958 AR7 Khasi AR7

The primal father and the mother of the members of every clan are respectively known as *U-Parad* (*U-Thawlang*) and *Ka-Meyrad* (*Ka-Iawbei*). 614 192 773

There is a large number of clans among the Khasis and some of the clan names are those of animals and trees. *Shrieh* is monkey, *tham*, a crab, and *dingdoh*, a tree ; yet they do not constitute totemic clan organization. The clan names are not even the names of the ancestress. The clans are not ancestral but rather were territorial in nature when the clansmen (*shi-Kur*) used to live in a place having a common land (*ri-kur*) and a clan ossuary (*mawbah*) where the bones of the dead clansmen were deposited. 614 551

Unlike the clans, the sub-clans (*ka-k'poh*) are ancestral. As for example, in case of the *Siem* clan of the Chera state, it is found that Ka-Khiem was the primal ancestress. Her daughter Ka-Pet had three daughters, namely, Ka-Sngi, Ka-Lngen, and Ka-Kreh each of whom is regarded as the *Ka-K' poh* (*meaning* womb) of their respective descendants who are *shi-K'poh* (the members of the same womb). And their names are the names of the three sub-clans of the *siem* clan. 613

The names of the sub-clans of some of the clans as collected from the elderly Khasi women are given below. 613 614 551

CLAN	SUB-CLAN
1. Siem	— sngi ; lngen , kreh
2. Khongsit	— yin , phai ; har ; jiram
3. Kharshiing	— iew ; mah ; sayngiar , iynean
4. Lyngdoh	— kaban ; summhir ; kamai
5. Nongrum	— tungan ; tungwi ; syngna , buhai
6. Khongrymai	— thania ; thani , barhai , lisi
7. Jaidkhar	— hazi ; haza , tuli ; tula
8. Simpilian	— eli ; mayar ; josi , emi

Family (*ka-iing*) among the Khasis is the socio-economic and religious unit. Due to matrilocal residence, the structure of the Khasi families assumes a different form. The constituent members are the grandmother, her daughters and their children. But the parmanent[1] residents are the youngest daughter (*ka-khadduh*), her husband and daughters. It takes an 596

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

601 Term 19 and 20 — *para kur* and *para kha*; the former for all cousins and half-siblings on the mother's and the latter for those on the father's side, show the consciousness of the matrilineal clan-affinity and the patrilineal biological relationship through their classificatory subdivision, which is also true of

Term 21, 21/*a* and 21/*b*; — the *bakha* are cross-cousins.

Term 21/*b* shows special consideration for the older paternal male cousin of the first degree, who is addressed as *bah* whilst the older maternal male cousin of the first degree is addressed as *kong*, like the older female cousins on both sides.

Term 23, 23/*a*, 23/*b*, — *ksiew* for grandchildren would appear to mean: [192] dog's children. It has, however, been pointed out to me, by Khasi friends, that the Khasi word for dog is *ksew*; not *ksiew*. The Pnár (Jaintia) pronunciation *ki ksu* for grandchildren, and the occasionally occuring designation of great-grandchildren as "cats children" (term 24) and of great-great-grandchildren as "rats children" (term 25), however, would appear rather to suggest the derivation of *khun ksiew* from *ksew* — dog, than from a meaningless separate root.

Term 24 — *khun miaw* (i. e. cats children) for great-grandchildren is used among Plateau Khasi families. BERNATZIK considers with CREDNER, E. LUNET DE LAJONQUIÈRE, MARABAILS and EICKSTEDT the possibility that [197] the name of the Meau has been derived from cats [30]. This is a hill tribe, speaking a language with some similarity to the Mon-Khmer group [31] (to which also the Khasi language belongs). The Meau are living not very far from the possible homeland of the Khasi around the region of S. China, N. Siam and Indo-China. If a parallel should here be assumed, the two complementary Khasi terms No. 23 (dogs children) and 25 (rats children) may appear to be formed on the basis of analogy with the term "cats children" as tribal self-designation. Another explanation, however, of this unusual kinship-term which was given to me by a Khasi friend, contented that each generation, seen from the ancestral parent's point of view, is as numerous as the young of the respective varieties of animals.

Term 25 — *khun knai* (rats children) comments: — see: term 24, (supra).

601 602 Term 26 — *u ñi* — *u kong* as a honorific term for the maternal uncles and the husbands of the elder sisters and elder female cousins on the maternal side, illustrates the great respect shown to male relatives on the mother's side by adding the masculine preposition *u* to the word *kong*, which generally signifies older female maternal relatives, but in this case, their husbands (comp. term 33/*e*). This usage of the term is reminiscent of the Brahmin ceremonies performed for male maternal ancestors, instead of for mothers, grandmothers, etc. It also tallies with my observations, otherwise obtained [32]

[30] BERNATZIK (1947), pp. 6, 7.

[31] BERNATZIK (1947), p. 445, though he denies the inclusion of the Meau into the Mon-Khmer group.

614 to his own matriarchal stock, and at his death his bones
764 are deposited in the cromlech of his mother's kin. In
Jowai he neither lives nor eats in his wife's house, but
[591] visits it only after dark (p. 76). In the veneration of
ancestors, which is the foundation of the tribal piety,
769 the primal ancestress (*Ka Iāwbei*) and her brother are
211 the only persons regarded. The flat memorial stones
set up to perpetuate the memory of the dead are called
after the woman who represents the clan (*māw kynthei*,
p. 150), and the standing stones ranged behind them
are dedicated to the male kinsmen on the mother's
side.

776 In harmony with this scheme of ancestor worship,
the other spirits to whom propitiation is offered are
mainly female, though here male personages also figure
(pp. 106—109). The powers of sickness and death are
all female, and these are those most frequently wor-
shipped (p. 107). The two protectors of the household
are goddesses (p. 112), though with them is also revered
the first father of the clan, *U Thāwlang*.

793 Priestesses assist at all sacrifices, and the male
643 officiants are only their deputies (p. 121); in one
important state, Khyrim, the High Priestess and actual
head of the State is a woman, who combines in her
person sacerdotal and regal functions (p. 70).

193 The Khasi language, so far as known, is the only
member of the Mān-Khmēr family which possesses
a grammatical gender, distinguishing all nouns as
masculine and feminine; and here also the feminine
nouns immensely preponderate (p. 206). The pronouns
of the second (*mē*, *phā*) and third person (*ū*, *kā*) have
separate forms for the sexes in the singular, but in the
plural only one is used (*phī*, *kī*), and this is the plural
form of the feminine singular.

000 It may perhaps be ascribed to the pre-eminence

wonderful mass of granite known by the name of the Kyllang Rock will be found in the section of the monograph which deals with geographical distribution. I have also added a photograph of the rock. The Syntengs have a story that when the strong west wind blows in the spring this is due to the advent of *U Kyllang*, who comes to visit his wife, the river *Umngot*, at that season: amongst the Khasis hills are all of them masculine, but to rivers is usually attributed the feminine gender. U Symper is another isolated rocky eminence rising from the Maharam plain close to the village of K'mawan. The best view of the hill is obtainable from Laitmawsiang on the path to Mawsynram. The village of Mawsmai every traveller from Therria to Cherrapunji knows. It is chiefly remarkable for a fairly large limestone cave, and its fine memorial stones. The Khasi theory to explain how the moon got its spots is, I believe, original, but is no more extraordinary than our own nursery tale about the "man in the moon." The *Sohpet Byneng* hill is the first hill of any size that the traveller sees on the Gauhati road when journeying to Shillong. It is close to Umsning Dak Bungalow. There are caves in the hill which are tenanted by bears. Strange to say, according to Khasi ideas, this is one of the highest points in the hills; in reality *Sophet Byneng* is some 2,000 ft. lower than the Shillong Peak. As mentioned elsewhere, the Khasis are very fond of dogs; so I have given their version of how the dog came to live with man. The well-known *thlen* superstition will be found fully described under the heading of "Human sacrifices." I have, however, thought the tale of sufficient interest to reproduce at length here. The story of the river Rupatylli is a pretty tale, and is just such a one as would appeal to the imagination of mountaineers like the Khasis. The Kopili story is important, in that it indicates the origin of human sacrifices in the Jaintia Hills; it also throws, perhaps, some light on the question of the use to which the flat table memorial stones were put in years gone by. The superstition about the crossing of the Kopili can be vouched for by many who have taken the journey from the Jaintia Hills to North Cachar by the Kopili route. Mawpunkyrtiang is a small village close to Cherrapunji. The weird tale about the Siem of Malyniang is the pride of the Maskut people, for in olden days their King,

197 Professor Kuhn. Unfortunately, I had time to collect but a few words of this interesting dialect, as I arrived in the portion of the country inhabited by these people only a short time before submitting this monograph to Government. The Mynnar dialect appears to be akin to the Synteng, Lakadong, and Amwi forms of speech. The Mynnars observe also the Synteng ceremony of "*Bek-diwp-khlam*," or driving away the demon of cholera, so that although now inhabiting a part of the country a considerable distance away from that of the Syntengs, it is not unlikely that they were originally connected with the latter more closely.

Professor Kuhn comes to the conclusion that there is a distinct connection between Khasi, Mon or Talaing, Khmêr, and the other languages of Indo-China that have been mentioned, which is to be seen not only from similarities in some of the numerals, but from the convincing conformities of many other words of these languages. He goes on to add that more important than these contacts of the mono-syllabic languages of Indo-China with mono-syllabic Khasi is their affinity with the Kol, and Nancowry poly-syllabic languages and with that of the aboriginal inhabitants of Malacca, i.e. the languages of the so-called Orang-Utang, or men of the woods, Sakei, Semung, Orang-Benua, and others; and that although it is not, perhaps, permissible to derive at once from this connection the relation of the Khasi Mon-Khmêr mono-syllabic group with these poly-syllabic languages, it seems to be certain that a common substratum lies below a great portion of the Indo-Chinese languages as well as those of the Kol and Ho-Munda group. More important than connections between words is, as Dr. Grierson points out in his introduction to the Mon-Khmêr family, the order of the words in the sentence. In both Khasi and Mon
193 that order is subject, verb, object. Taking this fact in conjunc-
197 tion with the similarities of the Khasi and Mon vocabularies, we may conclude that it is proof positive of the connection between Khasi and Mon, or Talaing. In Munda, however, the order is subject, object, verb. This is a very important difference, for, as Dr. Grierson points out, "the order of words in a sentence follows the order of thought of the speaker; it follows therefore that the Mundas think in an order of ideas different

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

from those of the Khasis and the Mons. Dr. Grierson comes to the same conclusion with respect to these languages as Professor Kuhn, which is as follows:—"Owing to the existence of these differences we should not be justified in assuming a common origin for the Mon-Khmêr langu..ges on the one hand, and for the Munda, Nancowry, and Malacca languages on the other. We may, however, safely assume that there is at the bottom of all these tongues a common substratum, over which there have settled layers of the speeches of other peoples, differing in different localities. Nevertheless, this substratum was so firmly established as to prevent its being entirely hidden by them, and frequent undeniable traces of it are still discernible in languages spoken in widely distant tracts of Nearer and Further India. Of what language this original substratum consisted we are not yet in a position to say. Whatever it was, it covered a wide area, larger than the area covered by many families of languages in India at the present day. Languages with this common substratum are now spoken, not only in the modern Province of Assam, in Burma, Siam, Cambodia, and Anam, but also over the whole of Central India, as far west as the Berars." Grierson, having agreed regarding the existence of this common substratum, does not finally determine whether the ancient substratum was the parent of the present Munda languages, or of the Mon-Khmêr language. He says, "It cannot have been the parent of both, but it is possible that it was the parent of neither." We are thus still in a state of uncertainty as to what was the origin of these languages. 197 193

The brief description which follows of some of the more prominent characteristics of the Khasi language is based chiefly on Sir Charles Lyall's skeleton Grammar contained in Vol. II. of Dr. Grierson's "Linguistic Survey of India." It does not pretend to be an exhaustive treatise on the language; for this students are referred to the excellent grammar compiled by the Rev. H. Roberts. 193 [14]

The Article.—There are four articles in Khasi; three in the singular, *u* (masculine), *ka* (feminine), and *i* (diminutive of both genders); and one in the plural for both genders, *ki*.

All Khasi nouns take a pronominal prefix to denote the gender, i.e. the third personal pronoun, *u* (masculine), *ka* (feminine),

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

193 *i* (diminutive). The great majority of inanimate nouns are feminine, and all abstract nouns. The sun (day), *ka engi*, is feminine, the moon (month), *u Bnai*, is masculine. Sometimes the word varies in meaning according to the gender, e.g. *u ngap*, a law; *ka ngap*, honey.

Genders.—Names of mountains, stones, plants, fruits, stars, and the moon, are masculine, e.g.:—

U Lyngkop, the Kyllang rock.
U mawbrin, quartz.
U phew, potato.
U sah monster, savage.
U Ior shai, the morning star.
U Ior kulay, sun.
U Bnai, the moon.
